Germ-free animals are free from antibacterial agglutinins readily demonstrable in conventional animals, although in some instances antibodies are later developed due to antigen in the autoclaved diet. Undoubtedly germ-free animals will provide a useful tool for immunologists in such questions as the source of 'natural antibodies' or whether serum γ-globulin exists apart from that produced in response to an antigenic stimulus. Indeed, germ-free animals raised on diets free from antigenic materials would be a boon to immunologists. In one paper, germ-free animals were indispensable in experiments to refute the hypothesis that irreversible hæmorrhagic shock was due to absorption of bacterial endotoxins from the bowel.

Interesting experiments are described to show that the increased growth-rate of conventional chicks, reared on diets containing penicillin, did not occur in germ-free chicks, but did occur after particular bacterial species had been experimentally established in their intestines. Another paper gives an account of experiments which show that infection with *Entamoeba histolytica* produces no lesions in germ-free guinea pigs, whereas it produces extensive ulceration of the intestinal mucosa in conventional guinea pigs. The potential value of germ-free animals in investigation of dental caries is, of course, obvious. In addition, the process of ageing in germ-free animals offers possibilities, but very little has been achieved so far in this respect on account of competition for available germ-free animal accommodation. However, perhaps the most exciting possibilities of germ-free animals at present relate to investigation of latent viruses, cancer and the relationship between them. No work upon latent viruses with germ-free animals is reported but a beginning has been made with cancer.

Filtrates from methylcholanthracene-induced tumours in conventional chicks are not infective, but when such tumours are induced in germ-free chicks inoculation of cell-free suspensions, produced by filtration through coarse filters, produces tumours and inoculation of suspensions produced by filtration through fine filters produces a fatal wasting disease. Purification procedures and electron microscopy tend to associate the tumour-producing activity with microsomal or virus-like particles of 50–150 mμ diameter and the wasting disease with smaller particles (20 mμ). In uncompleted experiments with germ-free C_3H mice, no mammary tumours in the females or hepatomas in the males have appeared in 100 mice of which the oldest are more than 700 days, whereas in comparable conventional C_3H mice 90 per cent die of these tumours within about 300 days.

It seems that germ-free experimental animals are likely to prove indispensable tools to answer certain basic questions of capital importance in several fields of biological research; yet after these questions have been answered the value of germ-free animals may perhaps decline. This poses a difficult problem for those called upon to decide whether to support the production of germ-free animals, an expensive and long-term undertaking. A. W. GLEDHILL

WATER POLLUTION RESEARCH, 1958*

APPLIED scientific research must ensure that projects and results are directly relevant and immediately available, so it is satisfactory to see from the annual report of the work of the Water Pollution Research Laboratory that contacts with the industries and authorities concerned are increasing and producing useful conclusions. Apart from the report itself, information is exchanged through numerous publications in journals, the invaluable *Water Pollution Abstracts*, a new series entitled "Notes on Water Pollution", and several committees recently established where the Laboratory makes close contact with the River Boards, the Institute of Sewage Purification and the Federation of British Industries. Financial support by the latter body has enabled two new investigations of considerable importance to industry to be started, and there are many examples in the report of valuable short-term studies undertaken in collaboration with specific industries, often on a repayment basis. In particular, suggestions made by the Laboratory have enabled several firms to reduce the danger of pollution by simple changes in manufacturing processes instead of expensive purification plant, and anaerobic digestion has been shown to be suitable for the treatment of slaughterhouse wastes but not for whisky wastes.

In the field of automatic apparatus it is anticipated that the merits of the dissolved oxygen recorder developed and applied by the Laboratory will be recognized by commercial production. The use of continuous recorders for oxygen and temperature has made it clear that isolated samples often do not give sufficient information for the accurate assessment of the condition of a river.

The studies made in the Laboratory of the foaming of detergents, and their behaviour in sewage treatment plant, are of particular interest. As the detergents normally used are resistant to biological treatment in percolating filters or activated sludge plant, the effluents may cause objectionable frothing in rivers. Recently, a new active material has been developed by the industry and tests have shown that a much greater proportion is destroyed during sewage treatment. If this is confirmed in large-scale trials, and if it could then replace existing detergents, the state of many rivers and drinking-water supplies should be improved directly. There might also be a general improvement in the quality of many effluents, as the efficiency of treatment can be affected by the amount of detergent present.

It is to be hoped that successes in empirical investigations will not distract attention from more prolonged and fundamental studies which are likely to be more economical in the long run. For example, the detailed results of the analysis of domestic sewage are proving to be very interesting and it will be extremely useful to know exactly the nature of the substances which treatment must aim to destroy. Biologists will be encouraged to see the success of modern analytical methods for the detailed separation and identification of the components of such a complex material.

* Department of Scientific and Industrial Research. Water Pollution Research 1958. The Report of the Water Pollution Research Board with the Report of the Director of the Water Pollution Research Laboratory. Pp. v+113+4 plates. (London: H.M. Stationery Office, 1959.) 7s. net.

Investigations of the toxicity of various substances and the effects of temperature on fish continue In these studies, and also in work on biological treatments of sewage, cyanides and phenols, it is interesting to see the growing significance of acclimatization of the organism or the community Most of the toxicity studies have been based on mortalities during relatively short periods of exposure, and it would now seem necessary to study the effects of much longer exposures on the growth, longevity and reproduction of fish

The survey of the Thames estuary, which has been an important part of earlier reports, is now nearing completion Some examples of the difficulties that arise in predicting the behaviour of this intricate system are to be found in this report Recent improvements in the treatment of some of the sewage discharged to the estuary have apparently not produced the expected improvement in estuarine conditions for much of the year It seems probable that dredging may have to be added to the numerous factors which must be considered, as it appears that a concurrent reduction in the removal of organic matter in this way could have masked the effects of the improvements

It may be helpful to direct attention to two errors which might lead the reader to erroneous conclusions In Fig 4, p 13, the continuous lines refer to a depth of 3 ft and the broken lines to 15 ft, not vice versa as in the key given In a section describing the work of the reviewer while at the Laboratory (p 85), the last paragraph should start, "The gross rates of oxygen production are nearly twice (not ten times) published values for various aquatic plants in optimum light but in stagnant vessels Static values for the plants used, obtained by extrapolating the flow curves, are much lower than the experimental stagnant results" D F Westlake

UNIVERSITY OF OXFORD SECOND TANGANYIKA EXPEDITION

WITH the encouragement of the Government of Tanganyika, a second party from the University of Oxford visited the Mahali Mountains on the eastern shore of Lake Tanganyika during July to October to continue the work started by last year's expedition (see *Nature*, 183, 726, March 14, 1959)

The Mahalis form a small, well-defined, yet little known region, not typical of most of Tanganyika, where flora and fauna of East and West Africa meet Whereas last year's expedition concentrated on the southern half of the peninsula this year the base camp was farther north, at Kasoge, a short distance from Mount Kungwe (c 8,250 ft), the highest peak in the range

A collection of plants at all altitudes above lake-level was made by R M Harley and J G B Newbould, of the Botany School, Oxford The specimens have been sent to the Royal Botanic Gardens at Kew for identification and will be used in the preparation of the Flora of Tropical East Africa The collection includes a number of live orchids which are now in the orchid houses at Kew

The two zoologists made a general collection of birds, snakes and small mammals and also specialized in Arachnida and freshwater biology J A Cooke, of the Zoology Department, Oxford, made an exhaustive study of the spiders in the area and collected nearly 4,000 specimens D H Eccles, of the Bureau of Animal Population, Oxford, collected several hundred fish from the streams draining into Lake Tanganyika, using both poison and electric shock methods For two weeks the party was joined by G H Yeoman, of the Tanganyika Veterinary Department, who was investigating parasites on small mammals

W J Wadsworth and R C Herrera, of the Department of Geology, Oxford, made a geological investigation of the layered igneous intrusion at Kapalagulu, about 20 miles north-east of Mount Kungwe T E Stevens, of the same Department, completed a survey of the Mount Kungwe region itself Collections of rock specimens from these two areas will be examined in the Department of Geology, Oxford, and at the Geological Survey, Dodoma, Tanganyika

R Davis, of the Institute of Experimental Psychology, Oxford, conducted experiments on reaction times and visual perception among local inhabitants and tested 350 children in missions and native authority schools as part of a comparative study of African and European children A household survey of villages in the northern half of the peninsula was also undertaken

The members of the expedition participated in the social activities of the region and various features of local life were recorded, both photographically and on magnetic tape R Davis

GEOMAGNETIC ACTIVITY AT HALLEY BAY ON DISTURBED DAYS

By J MacDOWALL

Meteorological Office, London

THIS examination of the diurnal variation of geomagnetic activity at Halley Bay, lat 75° 31′ S, long 26° 37′ W, was based on *Q*-indices which occurred during the five most disturbed days in each month A year was formed from the twenty months observations and then divided into four seasons

Greatest activity occurred for the seven hours after local midnight in each season, but a significant seasonal change occurred in the form of the daily variation

Fig 1 shows that the mean activity of the year was of a similar form to the diurnal variation at the equinox However, Fig 2 illustrates the marked seasonal change in the form of the diurnal curve Near local midnight, activity started earliest in winter and latest in summer, but activity after mid-

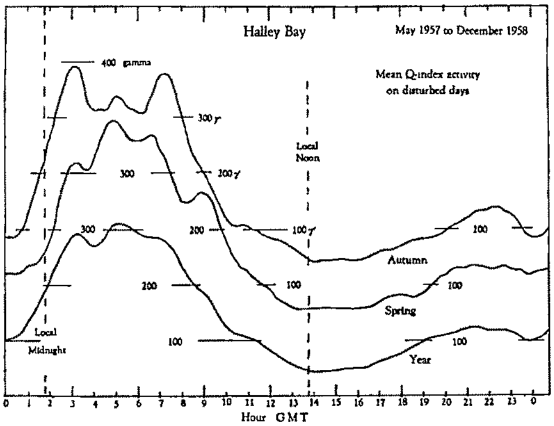

Fig 1 The general form of the variation was similar in these periods

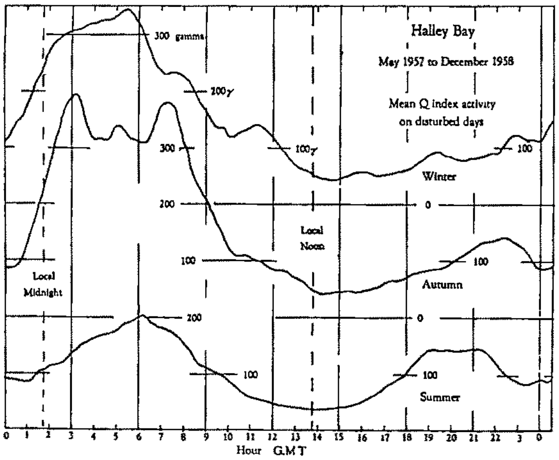

Fig 2 Seasonal changes to the daily variation of geomagnetic activity

night was greatest in autumn and least in summer. At 1115 G M T there was a subsidiary maximum of activity in the winter: this effect was just evident at 1015 G M T in autumn, but during summer there was no sign of this feature.

For most of the year the second most active period occurred in the evening and was separated from the main disturbance period by a brief minimum near 0000 G M T. Such evening activity was greatest and earliest in summer, and the equinox showed an intermediate type of variation. In the later aspect the seasonal change in the evening differs from the change in the early morning, where greatest activity occurred at the equinox. Further difference between the early morning and evening periods was revealed when the change with time in the sign of 'bay-like' disturbances (of types *b*, *bp*, *bps*, *bs*) was examined in Table 1.

Table 1 EFFECT OF TIME ON THE MAIN MOVEMENT OF THE HORIZONTAL AND VERTICAL COMPONENTS IN BAY DISTURBANCES, HALLEY BAY, JANUARY–JUNE 1958

Percentage of bay disturbances with certain signs

G M T period	H −ve Z +ve	H +ve Z −ve	Other signs	Total number all movements
15–18	0	100	0	5
18–21	3	82	15	31
21–24	43	24	33	51
0–3	93	1	6	78
3–6	93	0	7	56
6–9	93	0	7	14
9–12	100	0	0	5
Day	70	18	12	240

During the most active period from 0000 to 0600 G M T, field changes of such geomagnetic phenomena were almost entirely negative for the horizontal component and positive for the vertical component, but in the subsidiary active period before 0000 G M T. the reverse field movements were most frequent. The zone of maximum auroral frequency was situated just south of Halley Bay, so that the sense of the change of vertical force would indicate a weakening of the auroral zone electro-jet before 0000 G M T, which was followed by a recovery and an even greater strengthening in the early morning. The change of the horizontal component indicated a reversal in the direction of the overhead zonal disturbance current system at about 0000 G M T.

Other ionospheric effects were observed with a Union ionosonde, in particular, ionosonde blackout observations bore a different relation to Q-indices in the evening and early morning. In the winter of 1958, blackouts which occurred from 1900 to 2300 G M T were not associated with high Q-indices, whereas during blackouts from 0000 to 1500 G M T high Q-indices occurred. This relation is illustrated in Fig 3 with the aid of ionosonde blackout data kindly supplied by Mr W H Bellchambers. It is

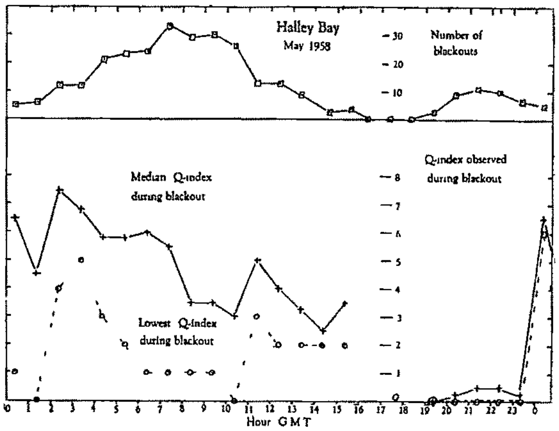

Fig 3 Geomagnetic activity which occurred during Union ionosonde blackout conditions

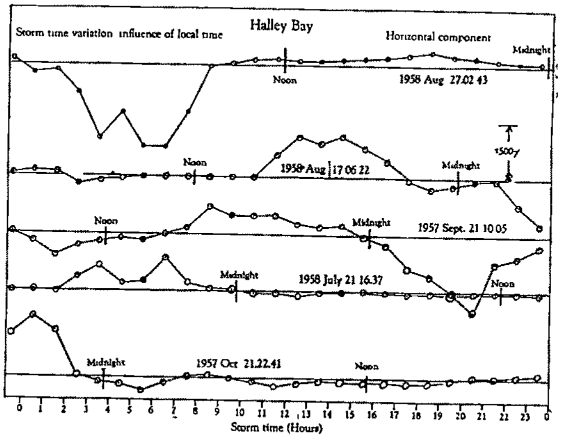

Fig 4 Influence of local time on the course of world-wide geomagnetic storms

also of interest to note in Fig. 3 the special nature of this relation near 1100 G.M.T., which may be compared with the peak in Q activity at 1115 G.M.T. in winter and shown in Fig. 2.

Nine occasions of confirmed world-wide sudden storm commencements (SSC) with commencements at different local times were examined. In Fig. 4 five of these storms are presented and show that the local time variations dominate the course of the storm. As in the case of bay disturbances, positive departures of the horizontal field occur before midnight and negative departures after midnight.

This work formed a part of the programme of the British National Committee for the International Geophysical Year; it was started at the Royal Society Base while I was seconded from the Meteorological Office. A full discussion of the results will be published as soon as possible. I gratefully acknowledge Mr. A. Blackie's assistance with the geomagnetic observations.

AN X-RAY STUDY OF RIGID-BODY AND INTERNAL VIBRATIONS OF ORGANIC MOLECULES

By Dame KATHLEEN LONSDALE, D.B.E., F.R.S., and Dr. H. JUDITH MILLEDGE
Department of Chemistry, University College, London, W.C.1

THE intensity of diffraction of X-rays by a set of parallel crystal planes depends upon the arrangement of the atoms, their electron-density distribution and their state of motion. Hitherto, most crystal-structure analyses have concentrated on the obtaining of accurate atomic positions and thence the spatial configuration of the molecules. It is almost always assumed that the atomic scattering factor f is a spherical function and that the atomic vibrations are at least approximately isotropic. In 1941 E. W. Hughes showed that it was impossible to obtain good agreement between observed and calculated scattering amplitudes for the various diffracted beams from crystals of melamine unless it was postulated that the vibration normal to the molecular plane was larger in amplitude than that parallel to the molecular plane. Moreover, electron-density Fourier diagrams often show elliptical atomic contours, which may indicate a static non-spherical distribution but are much more likely to indicate non-spherical motion. Fourier diagrams obtained from neutron-diffraction observations likewise show elliptical contours, and these must certainly indicate non-spherical movements (or at least displacements) of the nuclei. If the ellipticity persists at low temperatures then there is the possibility, of course, that it may indicate some kind of disorder or uncertainty in the atomic positions. The diffuse spots and streaks which form the elaborate patterns found on well-exposed X-ray photographs taken of stationary crystals using characteristic radiation are also due either to atomic or molecular thermal vibrations, or (if they are not variable with temperature) to zero-point energy or disorder. Finally, the large degree of anisotropy of thermal expansion usually found in organic crystals and easily measured accurately by X-ray diffraction methods proves that the lattice or molecular vibrations must also be anisotropic.

With the advent of high-speed computers, it is now possible to obtain for each atom, at least in the case of relatively simple molecules, not only the atomic co-ordinates but also sufficient constants to indicate the directions and magnitudes of the principal atomic thermal vibrations. (The details of the *Pegasus* computer programmes used in this work will be published elsewhere.) Making the simplifying assumption that the atomic vibration figure is an ellipsoid, this involves $(9n + 1)$ unknowns for a molecule containing n independent atoms: that is, we require for each atom three co-ordinates x, y, z; three principal atomic Debye factors B_X, B_Y, B_Z; three orthogonal directions to give the orientation of the atomic vibration ellipsoid, $\vec{X}$, $\vec{Y}$, $\vec{Z}$; and a scaling factor to put all diffraction amplitudes on an absolute scale. The accuracy with which these unknowns may be experimentally determined depends upon the number of available *hkl* diffraction intensities (these usually amount to several hundred, depending upon the size of the unit cell) and upon the precision achieved in making the intensity measurements. This can be tested by repetition, especially using more than one crystal, but is also dependent upon the success with which data can be scaled together when recorded on more than one film or under different conditions in respect of the geometry of the diffracted beams and the recording device. It is, in short, essential that systematic errors be avoided if an accurate determination of molecular and atomic vibrations is required.

Cruickshank[1] has pioneered in showing how to extract information about the translational and librational amplitudes of the molecule, treated as a rigid body, from the atomic thermal-vibration ellipsoids. He has, however, accepted Higgs's suggestion[2] that, compared with these rigid-body movements, the intramolecular vibrations, which distort the molecule, will be small.

We are able to prove that this is not always the case, and that if and when the internal vibrations are comparatively small, it may still be possible to deduce them from the experimental observations. Perhaps the most obvious proof is that even diamond, which is an infinite three-dimensional molecule, does show temperature-dependent diffuse spots (Lonsdale[3]), that it does expand (Thewlis and Davey[4]) and eventually becomes transformed into graphite. The root-mean-square $(\overline{u_X^2})^{1/2}$ amplitude of atomic vibration in diamond is about 0·04 A. (as deduced from the Debye temperature. Lonsdale[5] gives a value of $\overline{u^2} = 3\overline{u_X^2}$ which is too low) even though each atom is bonded to four others. Since $B_x = 8\pi^2\overline{u_X^2}$, the value $(\overline{u_X^2})^{1/2} = 0·04$ A. will correspond to a Debye factor of 0·13 (A.²) and this, although small, is not negligible.

One of us (H. J. M.) has calculated, from 3-dimensional powder data kindly supplied by Dr. G. E. Bacon, the Debye factor for graphite [0001] and has found the value 0.63, which corresponds to a root-mean-square vibration amplitude of about 0.09 A. Graphite has 'infinite' two-dimensional molecules which cannot undergo 'rigid-body' translations or librations. All vibrations must be intramolecular or distorting vibrations, and hence 0.09 A gives some measure of the internal vibration amplitude that is possible for an atom tightly bonded to two others, the vibration being normal to the plane of the bonds. In this case, however, the anisotropy of the electron-density distribution and hence of the atomic scattering factor must certainly be taken into account, and this will be considered elsewhere. What is relevant here is that intramolecular thermal vibrations alone, without translations or librations, are responsible for the thermal-expansion coefficient of graphite, which between 0° and 800° C is 28.2×10^{-6} (°C.)$^{-1}$ along [0001] (Nelson and Riley[6]).

A refinement of the hexagonal boron nitride (BN) structure, for which even with very careful intensity measurements Pease[7] only attained an R-factor of about 17 per cent, shows that by re-scaling and imposing anisotropic B-values of 0.7 in the molecular planes and 1.4 along the van der Waals [0001] bonds, R is reduced to 4.7 per cent. Certainly there is here also some bond anisotropy to be taken into account, but part, at least, of B [0001] must be due to thermal vibration and this value corresponds to a root-mean-square amplitude of intramolecular out-of-plane vibrations of 0.13 A. This larger magnitude as compared with the graphite out-of-plane vibrations fits well with the larger boron nitride thermal-expansion coefficient α $[0001] = 40.5 \times 10^{-6}$ (0–800° C.).

These coefficients of expansion, however, are small compared with those of most aromatic compounds (Lonsdale[8]), and we may undoubtedly expect that in the case of plane finite molecules separated from their neighbours by van der Waals distances, the principal cause of expansion will be the librations involving out-of-plane movements.

Our studies of a number of simple organic molecules have shown that, given a structure for which the residual-error factor R is small (preferably well below 10 per cent), it is possible to deduce, within limits, numerical values not only of the translational and librational vibration amplitudes but also of intramolecular amplitudes; and that the internal molecular vibrations that emerge from these analyses are reasonable ones. A similar analysis carried out on earlier Debye factors corresponding to higher R values (say of upwards of 12 per cent) simply produces nonsense. A useful check on the vibration pattern may be obtained by carrying out an independent structure and vibration analysis on the same compound at another temperature, or on an isomorphous or isostructural compound.

Following Higgs[2], we assume that the various molecular vibrations are independent of phase and that the resultant mean-square amplitude in any given direction is the sum of the mean-square amplitudes of atomic vibrations of all kinds, rigid-body or distortional, in that direction. For each molecule we may specify three principal directions of vibration, say $\vec{L}$, $\vec{M}$, $\vec{N}$ (Fig. 1), and for each atom in the molecule we have three principal directions $\vec{X}$, $\vec{Y}$, $\vec{Z}$ given by our X-ray analysis. These may be deduced from Fourier analysis (for example, $\vec{R}$, $\vec{T}$, $\vec{N}$ in 1.3.5-$C_6H_3Cl_3$) or postulated on grounds of symmetry and probability; thus, in di-*para*-xylylene, $C_{16}H_{16}$ (Brown[9]), the most likely $\vec{X}$, $\vec{Y}$, $\vec{Z}$ directions coincide at least approximately with the molecular $\vec{L}$, $\vec{M}$, $\vec{N}$. The actual determinations of $\vec{X}$, $\vec{Y}$, $\vec{Z}$ purely by computer refinement is the weakest link in the whole chain, being subject to very large standard deviations indeed. In fact, if one refines a molecule known to be *symmetrical* as if it were not (that is, using the computer programme for a less symmetrical space group) then the values produced for both B_X and $\vec{X}$ are found to be *asymmetrical*, especially in early stages of the refinement. But whereas the B_X values for atoms related by symmetry converge (if the data are good) to a point where they may justifiably be averaged, the $\vec{X}$ values do not necessarily do so. The machine, in fact, may attempt to improve the agreement between observed and calculated structure amplitudes by producing nonsense; and in the case of molecules having symmetrical formulæ an informed guess at the directions of $\vec{X}$, $\vec{Y}$, $\vec{Z}$ is probably better than an averaging of widely differing computer-produced values; although it may be advisable to try more than one such trial set of directions.

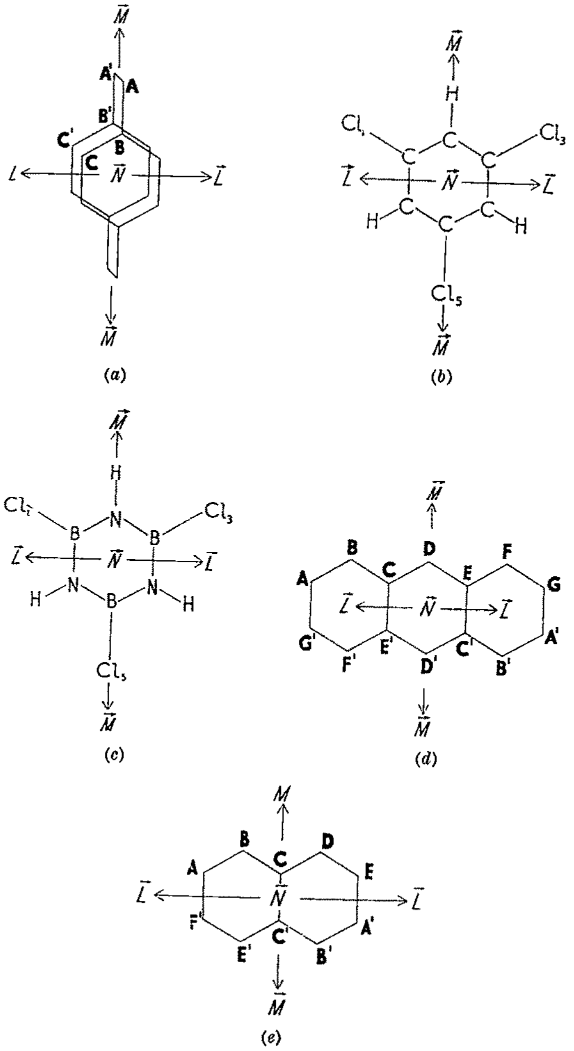

Fig. 1. Principal molecular directions assumed for $C_{16}H_{16}$, *symm.* $C_6H_3Cl_3$ ($C_6H_3Br_3$), $B_3N_3H_3Cl_3$, $C_{14}H_{10}$ and $C_{10}H_8$

We begin, therefore, with values of the molecular geometry and with three principal Debye factors B_X for each atom, derived from a large quantity of diffraction data. Let us call the mean-square rigid-body translation amplitudes t_L^2, t_M^2, t_N^2 (A.²) and the rigid-body libration amplitudes φ_L^2, φ_M^2, φ_N^2 (radians²) and let us then obtain a set of equations for $\overline{u_X^2}$ ($= B_X/8\pi^2$) for each atom **A**, **B**, **C** in the molecule. The movement due to libration, although along an arc, may be, for small displacements, taken as being along a tangent normal to the perpendicular (length R) from the atom to the axis of libration. Its mean-square amplitude will be $R_L^2\,\varphi_L^2$ (A.²). We wish to find t_L, t_M, t_N, φ_L, φ_M, φ_N, and also $\mathbf{A}_X$, $\mathbf{A}_Y$, $\mathbf{A}_Z$, $\mathbf{B}_X$ … $\mathbf{C}_Z$ which are the independent atomic vibration amplitudes along $\vec{X}$, $\vec{Y}$, $\vec{Z}$. The latter may be expected to combine into a few simple proper vibrations of the molecule. The whole system of vibration must explain the anisotropy of thermal expansion.

The details of the calculations will be published elsewhere, but it is possible to give here a selected example to illustrate the procedure. Consider $C_{16}H_{16}$, the molecule of which consists of two facing benzene rings linked by $(CH_2)_2$ bridges in *para*-positions[9]. The space group is $P4_2/mnm$ and the molecule (Fig. 1) has *mmm* symmetry. There are therefore only three independent atoms **A** (—CH₂—), **B** (—C$\langle$) and **C** (—CH=). The equations describing the $\vec{M}$ and $\vec{N}$ movements of these atoms are (at 291° K.):

$$\overline{u^2}\,(\mathbf{A},M) = t_M^2 + 0.66\,\varphi_L^2 + \mathbf{A}_M^2 = 0.0916 = 7.24/8\pi^2 \qquad (1)$$

$$\overline{u^2}\,(\mathbf{B},M) = t_M^2 + 1.89\,\varphi_L^2 + \mathbf{B}_M^2 = 0.0737 = 5.82/8\pi^2 \qquad (2)$$

$$\overline{u^2}\,(\mathbf{C},M) = t_M^2 + 2.38\,\varphi_L^2 + 1.42\,\varphi_N^2 + \mathbf{C}_M^2 = 0.0946 = 7.47/8\pi^2 \qquad (3)$$

$$\overline{u^2}\,(\mathbf{A},N) = t_N^2 + 7.98\,\varphi_L^2 + \mathbf{A}_N^2 = 0.0753 = 5.95/8\pi^2 \qquad (4)$$

$$\overline{u^2}\,(\mathbf{B},N) = t_N^2 + 1.91\,\varphi_L^2 + \mathbf{B}_N^2 = 0.0547 = 4.32/8\pi^2 \qquad (5)$$

$$\overline{u^2}\,(\mathbf{C},N) = t_N^2 + 0.51\,\varphi_L^2 + 1.42\,\varphi_M^2 + \mathbf{C}_N^2 = 0.0619 = 4.89/8\pi^2 \qquad (6)$$

From (1) and (2) we have

$$\mathbf{A}_M^2 = 0.0179 + \mathbf{B}_M^2 + 1.23\,\varphi_L^2$$

and therefore $\mathbf{A}_M^2 > 0.0179$ (A.²), $\mathbf{A}_M > 0.13$ A.

(The estimated standard deviation in $\overline{u_X^2}$ is about 0.006 A.², corresponding to 0.5 in $\mathbf{B}_X$.) From (4) we know that $7.98\,\varphi_L^2 \leqslant 0.0753$ (t_N^2, $\mathbf{A}_N^2$ are zero or positive) and from (5) $t_N^2 \leqslant 0.0547$ (φ_L^2, $\mathbf{B}_N^2$ zero or positive). Both these equalities could not, of course, be true simultaneously. From (4) and (5)

$$6.07\,\varphi_L^2 = 0{\cdot}0206 + (\mathbf{B}_N^2 - \mathbf{A}_N^2)$$

A large value of $\mathbf{A}_M$ would involve considerable stretching of bonds, unless $\mathbf{B}_N$ and $\mathbf{C}_N$ also have medium to large positive values, and therefore it is probable that $\mathbf{B}_N^2 > \mathbf{A}_N^2$, since $\mathbf{A}_N$ would not be large for any reasonable molecular vibration. If $\mathbf{B}_N^2 > \mathbf{A}_N^2$, then

$$0.0094 > \varphi_L^2 > 0.0034$$

which gives $\mathbf{A}_M^2 - \mathbf{B}_M^2 > 0.0221$, $\mathbf{A}_M > 0.15$ A. and

$$t_M^2 < 0.0673 \qquad t_M < 0.26 \text{ A.}$$
$$t_N^2 < 0.0482 \qquad t_N < 0.22 \text{ A.}$$

By a series of similar approximations we arrive at the values shown in Table 1, the limits of error being based on the indeterminacy inherent in the argument and not on possible experimental errors in the $\overline{u_X^2}$. This means that the actual numerical values may still need adjustment, although we believe the general pattern to be a correct one.

Table 1. PROBABLE RANGES OF VALUES OF INTERMOLECULAR AND INTRAMOLECULAR ROOT-MEAN-SQUARE VIBRATION AMPLITUDES FOR DI-*para*-XYLYLENE MOLECULES AT 291° K. AND 93° K., RESPECTIVELY

		t_L	t_M	t_N	φ_L	φ_M	φ_N	
291° K.	>	0.16	0.235	0.14 A.	0.065	0.045	0.065	radians
	<	0.21	0.255	0.21	0.085	0.08	0.085	
93° K.	>	0.14	0.15	0.09 A.	0.045	0.03	0.03	radians
	<	0.16	0.16	0.14	0.065	0.065	0.05	

		$\mathbf{A}_L$	$\mathbf{B}_L$	$\mathbf{C}_L$	$\mathbf{A}_M$	$\mathbf{B}_M$	$\mathbf{C}_M$	
291° K.	>	0.10	0.07	0	0.14	0	0.07	A.
	<	0.17	0.12	0.10	0.17	0.06	0.12	
93° K.	>	0.08	0.045	0	0.095	0	0.065	A.
	<	0.13	0.07	0.065	0.11	0.045	0.08	

		$\mathbf{A}_N$	$\mathbf{B}_N$	$\mathbf{C}_N$	
291° K.	>	0	0.07	0.10	A.
	<	0.06	0.14	0.20	
93° K.	>	0	0.045	0.045	A.
	<	0.045	0.10	0.125	

The rigid-body librations are such that the maximum values of $R_X\varphi_X$ are about equal in magnitude to the translational amplitudes. They are reduced by about one-third at 93° K. as compared with room temperatures, but the general pattern is the same although the complete structure analyses at the two temperatures are entirely independent (Lonsdale, Milledge and Rao, *Proc. Roy. Soc.*, in the press).

The internal movements are such as to imply two principal distorting vibrations of the molecule (Fig. 2). The first is a concertina movement involving $\mathbf{A}_M$ and $\mathbf{C}_N$, with smaller movements of $\mathbf{B}_M$, $\mathbf{B}_N$. The second is a twisting movement involving $\mathbf{A}_L$ and $\mathbf{B}_L$ with smaller $\mathbf{C}_L$ and $\mathbf{C}_M$ vibrations. There will be other movements superimposed on these, but only

Fig. 2. Molecular vibrations found for di*para*xylylene, $C_{16}H_{16}$

Table 2

	$C_6H_3Cl_3$ (293° K)	$C_6H_3Cl_3$ (93° K)	$C_6H_3Br_3$ (room temp)	$B_3N_3H_3Cl_3$ (room temp)
t_L (A)	0 195	0 115	0 155	0 24
t_M (A)	0 16	0 07	0 13	0 20
φ_N (radians)	0 085	0 03	0 05	0 065

these are clear , and it will be seen that they involve amplitudes comparable with, though smaller than, the t and $R\varphi$ values We are investigating other compounds (*bis*-2 7-dimethylene naphthalene and di-*m*-xylylene) where a forced proximity and parallelism of aromatic rings may be expected to imply large internal vibrations of the molecule

We have also studied 1 3 5-$C_6H_3Cl_3$ (at 293° K and 93° K) and 1 3 5-$C_6H_3Br_3$ (Milledge and Pant[10] , Milledge and Lonsdale, in the press) and we have refined the structure of *BBB*-$B_3N_3H_3Cl_3$ originally analysed by Coursen and Hoard[11] The first two are isomorphous, the latter has a structure closely similar in orientation of the molecules, although not isomorphous (Lonsdale, in the press) The data for the benzene compounds are insufficient to give a complete vibration analysis, but they do give the approximate values of t_L, t_M and φ_N shown in Table 2

It will be seen that the magnitudes are comparable with those obtained for $C_{16}H_{16}$, but that the heavier isomorph has the smaller vibrations

The independent vibrations of the three chlorine atoms in $C_6H_3Cl_3$ are not equivalent In a direction tangential to the benzene ring the atoms Cl_1 Cl_3, Cl_5 (Fig 1) have mean-square amplitudes 0 0136 , 0 , 0 0324 A ^{2} respectively, at 293° K (or possibly 0 0136 $+ k$, k , 0 0324 $+ k$, with a corresponding reduction in $\varphi_N{}^2$ A weakness of our simple method is that it cannot distinguish these two possibilities) To eliminate these differences would involve errors of 1 0 and 2 5, respectively, in the measurement of the Debye factors, whereas the estimated standard deviation is only about 0 25 Nor is it unreasonable that they should differ, since the bonds linking them to neighbouring molecules are different for the three chlorine atoms

The molecule of $B_3N_3H_3Cl_3$ has a plane of symmetry parallel to $(0\overline{1}0)$ The chlorine atom on the mirror plane has $\overline{u_T{}^2}$ (tangential to the ring) greater than that of the asymmetric chlorine But there are also indications of a marked independent movement of the boron and nitrogen atoms normal to the molecular plane This is consistent with the [0001] movements in hexagonal boron nitride previously mentioned

Finally, we may consider anthracene and naphthalene Previous thermal analyses of anthracene have been based on experimental data which were only claimed to be accurate to about 10 per cent (Mathieson *et al* [12]) and which more accurate recent data have shown to be subject also to some systematic errors No complete set of accurate 3-dimensional $|F|$ values is yet available, but two partial sets, one 3- and one 2-dimensional, measured by Geiger-counter and photographic methods respectively, agree to 3 5 per cent and refine to 4 4 and 5 6 per cent, to give molecular geometries and B_X values which differ by far less than the estimated standard deviations calculated for either set separately Moreover, independent two-dimensional data at low temperatures refine to 6 6 per cent to give a similar, though reduced, thermal vibration pattern

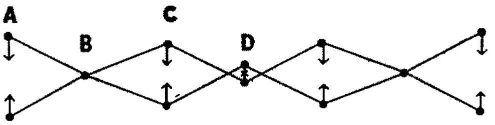

Fig 3 One possible vibration of anthracene, $C_{14}H_{10}$

Cruickshank[1] gave the thermal amplitudes for each atom A—G (Fig 1) in tangential, radial and normal directions with respect to the mass centre and plane of the molecule We believe that the experimental data indicate that $\overrightarrow{L}$, $\overrightarrow{M}$ and $\overrightarrow{N}$ are the correct principal atomic directions, except possibly for the extreme atoms **A** and **G** Assuming that **A** and **G**, **B** and **F**, **C** and **E** are equal within each pair, we obtain the results given in Table 3 (Lonsdale, Mason and Milledge, in preparation)

Table 3 PROBABLE RANGES OF VALUES OF INTERMOLECULAR AND INTRAMOLECULAR ROOT-MEAN-SQUARE VIBRATION AMPLITUDES FOR ANTHRACENE MOLECULES AT 290° K AND 95° K RESPECTIVELY

		t_L	t_M	t_N	φ_L	φ_M	φ_N

	<	0 09	0 03	0 075	0 05	

		$\mathbf{A}_L$	$\mathbf{B}_L$	$\mathbf{C}_L$	$\mathbf{D}_L$	$\mathbf{A}_M$	$\mathbf{B}_M$	$\mathbf{C}_M$	$\mathbf{D}_M$	
95° K	>	0 04	0 02	0 04	0	0	0 095	0	0 085	A
	<	0 055	0 04	0 055	0 02	0 085	0 105	0 06	0 11	

		$\mathbf{A}_N$	$\mathbf{B}_N$	$\mathbf{C}_N$	$\mathbf{D}_N$	
95° K	>	0 03	0	0 055	0	A
	<	0 10	0 03	0 09	0 07	

The t and φ values are similar to those of the compounds previously studied, but there are also striking intramolecular vibrations The large values of $\mathbf{B}_M$ and $\mathbf{D}_M$, combined with $\mathbf{A}_L$, point to an in-plane distortion which appears not to be markedly sensitive to temperature Similarly, the out-of-plane vibrations $\mathbf{A}_N$ and $\mathbf{C}_N$ are large at both temperatures, but $\mathbf{B}_N$ and $\mathbf{D}_N$ are not If $\mathbf{A}_M$ and $\mathbf{C}_M$ are related in phase, then some such movement as is shown in Fig 3 would result , but there is no proof that this particular interpretation of Table 3 is correct

A weakness of the method previously mentioned, which may be illustrated by naphthalene, is that there is as yet no way of deciding, on our simple model, whether the calculated value of (say) t_L should be reduced by k and the values of $\mathbf{A}_L$, $\mathbf{B}_L$, etc , all increased by the same amount Since $\mathbf{A}_L$, $\mathbf{B}_L$, etc , are not necessarily in phase, these would represent different vibration patterns Thus, the observed $\overline{u_L{}^2}$ and $\overline{u_M{}^2}$ for naphthalene can all be satisfactorily explained in terms of $t_L = 0$ 21 A , $t_M = 0$ 17 A , $\varphi_N = 0$ 072 radians, with $\mathbf{A}_L = \mathbf{A}_M = \mathbf{B}_L \quad = 0$ In the perpendicular direction, however, $\mathbf{A}_N$ and $\mathbf{C}_N$ are found to be about 0 11 $\pm$ 0 02 A , with $\mathbf{B}_N = 0$, implying an out-of-plane bending or puckering vibration of the molecule Our consistent practice has been to assume that, failing evidence to the contrary, the internal vibrations are zero

We recognize that the analyses we have illustrated here are over-simplified The major defect, that of an assumption of a spherical atomic scattering factor, is now being investigated in the light of the experimental data for graphite and hexagonal boron nitride. We do not believe that this source of error is eliminated by using only high-angle reflexions in the thermal analysis ; errors may even be introduced by this procedure.

Perhaps we can justify the simplicity of our approach by suggesting that if earlier workers had been inhibited, in their initial analyses of the structures of simple ionic compounds and of diamond, by their original neglect of refraction, dispersion, temperature vibrations, defect and disorder, the fundamental advances in crystal-structure analysis for which they were responsible would have been very much delayed.

We are most grateful to several colleagues for the use of intensity data prior to publication, or for original data published in a modified form ; and also for crystal specimens.

The calculations of atomic co-ordinates and *B*-factors basic to this article were carried out with the help of a grant for computing made from the Wellcome Trust, and with the use of tape-editing equipment purchased by means of a grant from the University of London Central Research Fund. Our thanks are also due to Messrs. Babcock and Wilcox, Ltd., for enabling us to use their Ferranti *Pegasus* computer.

One of us (K. L.) would like here to acknowledge personal indebtedness to the late Sir William Bragg for a training which emphasized that a simple approach to a difficult problem is not necessarily an inaccurate one.

FLORAL MORPHOLOGY AND THE TAXONOMY OF EUCALYPTUS

By Dr. D. J. CARR and S. G. M. CARR

Botany Department, University of Melbourne

THERE has been, in recent years, a revival of interest in 'old-fashioned' comparative morphology as a tool in problems of taxonomy and phylogeny of Angiosperms[1]. Among the many groups in which conventional study of the morphology of the flower is still required is the large and important genus *Eucalyptus*, despite the fact that taxonomic relationships within this genus have been under fairly continuous scrutiny over the past 150 years. In this, as in certain other genera of Myrtaceae[2], the perianth parts are united to form one or two opercula which cover the flower until anthesis. Practically no reliable information is available concerning the structure and behaviour of the opercula in most species, and little use has been made of operculum characters in classification, apart from length and shape. Only one floral character has been used in delimiting most of the major categories within the genus, namely, the shape and mode of dehiscence of the anthers, and even here diversity has not been thoroughly exploited. No reference, for example, has ever been made to the presence of supernumerary glands (additional to the terminal gland) in the connective or on the anther lobes of certain species. Attempts have been made to produce a workable classification or deduce affinities between species using criteria such as bud and fruit shape, operculum length, shape, venation and glaucousness of leaves, cotyledon shape, and, more recently[3], seed anatomy. Such are the difficulties of the standard classification that, although this is put forward in what purports to be a 'key' to the genus[4], it is virtually impossible to use it as such ; its deficiencies are well known to many Australian botanists (see, for example, ref. 5).

Comparative studies on the anatomy of wood[6], bark[7], chromosome complements[8], and pollen grains[9] have not yielded information of much value to the taxonomist, principally because these studies have been inadequate in both extent and depth. Nevertheless, botanists and foresters have become familiar with the facies of the species (more than five hundred according to Blakely, but possibly reducible to between three and four hundred) and this has led to the establishment of certain groups ('series') some of which may be accepted as consisting of closely allied species and therefore 'natural'. Others of Blakely's series are clearly artificial, and a few species are so imperfectly known that their allocation to series is either intuitive or quite arbitrary.

One of the worst features of *Eucalyptus* taxonomy is that it is based largely on what may be termed 'shaggy dog' features, characterized by the qualification 'more or less', rather than on quantitative features, expressible numerically or by presence or absence. But more important still is the lack of fundamental concepts of the relationships between the series. The larger taxonomic units or 'sections' are still based primarily on Bentham's five anther classes[10], despite the fact that at least forty kinds of anthers, differing in size, shape, dehiscence, etc.[11], have been distinguished, and that many species are notoriously difficult to 'key out' by their anthers. Any classification based entirely on shapes which can vary[11] and which cannot be adequately described in words is bound to contain anomalies and, as Bentham was well aware, such a classification, based on a single feature, must be somewhat artificial.

The genus *Eucalyptus* is supposed to be distinct from *Angophora* in that *Angophora* has both petals and sepals free, whereas in *Eucalyptus* one at least of the perianth whorls is in the form of an operculum which is shed at anthesis. In fact, as we shall show, certain species have only a petaline operculum with or without sepals, and the others have two opercula, the outer, sepaline, operculum being shed either prematurely or with the inner one at anthesis.

(We understand that Mr. L. A. S. Johnson, New South Wales Herbarium, has reached conclusions which, in certain details, confirm our own.) In certain species the sepals remain small but free from each other and may persist even on the mature fruit. This condition of chorisepaly is found in species belonging to several of the groups which have evolved within the genus, although certain chorisepalous species, mostly grouped as series Eudesmieae, may be fairly closely related to each other. The Eudesmieae are characterized by the persistence of the sepals as small teeth and/or the grouping of the stamens into four bundles, opposite the petals, which are fused to form a single operculum. In the very young flower bud the sepals are large, relative to the other organs, but they soon cease growth and in the mature flower seem comparatively minute. Some of the species of Eudesmieae have both persistent, free sepals and grouped stamens (for example, *E. tetragona*), others (for example, *E. gamophylla*, wrongly placed by Blakely) have only the first of these characters, and other species again have no sepals but have the stamens grouped (for example, *E. baileyana*). (For *Eucalyptus*, Blakely's nomenclature (see ref. 4) is used throughout this communication. For related genera, the nomenclature is that used in ref. 9.) Microscopic examination of sections of the flower buds of the latter species has failed to reveal any trace of the sepals. In all species of *Eucalyptus* the inner and outer surfaces of both sepals and petals are covered by a cuticle which can be distinguished by the techniques of fluorescence microscopy[12]. In critical cases, as, for example, in *E. albens*, the presence of two opercula, closely adherent to each other, can be demonstrated only by fluorescence microscopy of thin sections of the mature bud, or by a study of the development of the flower bud (Fig. 1).

The species of the Eudesmieae may be arranged as a series in which the sepal primordia are progressively reduced in size until they are eventually suppressed altogether, thus leading to a condition in which only one perianth whorl (presumably the corolla) is formed. This condition is common to most, but by no means all, of the species included in the section Renantherae, and to all of those in the Renantheroideae. The species of Blakely's series Myrtiformes (section Renantherae), *E. deglupta*, *E. raveretiana* and *E. brachyandra*, have double opercula and should possibly be placed with the Exsertae (section Macrantherae).

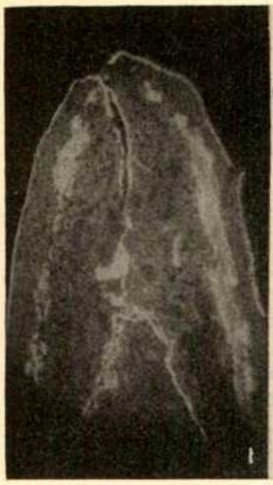

Fig. 1. Fluorescence photomicrograph (× 25) of a median longitudinal section of the tip of a mature flower bud of *E. sideroxylon*, showing fluorescence of cuticle on sepaline and petaline opercula and the cuticle-lined canal at the tip of the sepaline operculum. The canal in the petaline operculum is not seen in this section

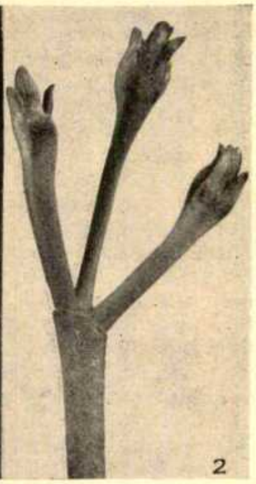

Fig. 2. Young inflorescence (× 1·5) of *E. steedmanii* after shedding of bracts. The sepals of the three flower buds are free and comparatively large

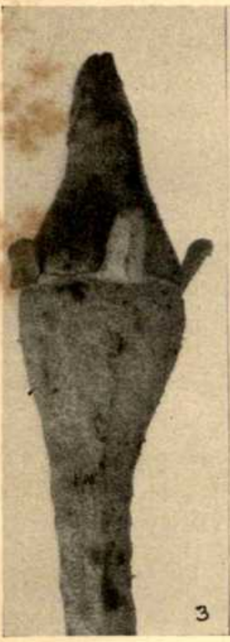
We have already shown that *E. microcorys* should be excluded on other grounds[13], and both it and *E. guilfoylei* should be placed with the Transversae. On the other hand, *E. jacksoni*, which has been confused with *E. guilfoylei* (they are ecologically associated and were both originally described from non-flowering material) should be placed in the Renantheroideae near *E. patens*, as suggested by Gardner[14].

Some of the species of the Macrantherae are mono-operculate (*E. preissiana* and *E. megacarpa* (series Globulares) and *E. miniata* and *E. phoenicea* (series Miniatae). If these species are to be grouped together with the renantherous species, the new arrangement would appear to cut directly across the system based on anther shapes. The species involved in this grouping, however, show every transition from the macrantherous condition (Miniatae) to the fully renantherous. Moreover, other characters such as the possession of stellate hairs by the juvenile foliage and, according to recent work[3], some of the characters of the seeds appear to be common to many of the mono-operculate species and uncommon in, or even quite absent from, species with double opercula. We have traced[13] the progressive increase in the number of flowers in the dichasial cluster from the Eudesmieae to the Renantherae, and in the degree of fusion of the bracts of the involucre, which never number more than six in the mono-operculate species. We propose to group these species in a sub-genus for which we suggest the informal name 'Monocalyptus'.

Although asepaly or chorisepaly is necessarily associated with a mono-operculate condition, it does not follow that all species in which the sepals are free from each other should be placed together, and Blakely's Eudesmieae may prove to contain some species unrelated to the others. Chorisepaly occurs in some other species but has not hitherto been recognized. The young flower buds of *E. steedmanii*, a species described in 1933, has sepals which are very large in proportion to the other organs. Although they remain free from one another, they become adherent to the petaline operculum as thick ribs with free recurved tips (Fig. 2). This species appears to be most closely allied to those of the series Dumosae. Free sepals are also present on the flower buds of *E. kruseana*, but they are delicately attached and are usually shed a little before anthesis (Fig. 3). This species is placed by Blakely in a highly artificial series, *Globulares*, but in its habit, foliage and cotyledon shape[15] it resembles *E. crucis* and should be placed near it.

The primordia of both sepals and petals arise in decussate pairs (in accordance with the basic phyllotaxis of *Eucalyptus*[16]) and the first formed pair of sepals and petals are generally larger than the other pair. Occasionally five sepals are formed. Apical growth of the sepal primordia soon ceases and further enlargement takes place either by zonal growth, in which the bases of the sepals are united to form a tube, or by separate intercalary meristems. In the former case a sepaline operculum is formed, while the latter results in chorisepaly, the length of the



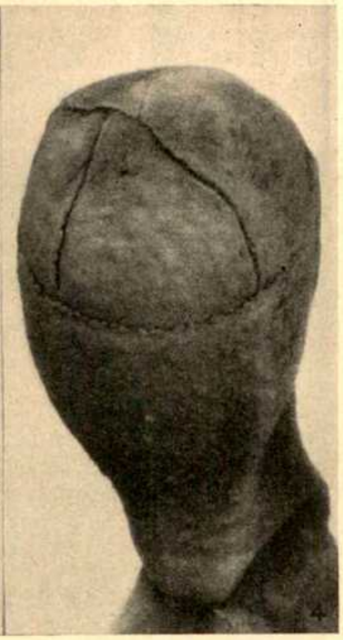


Fig. 3. Flower bud of *E. kruseana* showing the free sepals (× 20)

Fig. 4. Flower bud of *E. guilfoylei*, seen from above to show the abscission scar of the sepaline operculum and the sutures of the petals, which form the petaline operculum (× 10)

sepals depending on the extent of intercalary growth. In all cases, at least the tips of the sepals remain free from each other and the tips of the petals are also free. Thus the tip of each operculum is traversed by a cuticle-lined canal. The limbs of the sepals may also be free from each other to an extent depending on the delay in initiation of the circular meristem at the base of the sepal primordia. In *E. pyriformis*, for example, the sepals are free from each other for about one-third their length (compare ref. 17), but die and are shed when the flower buds are about 1 cm. long. In a few species the sepals are free from each other but undergo abscission when the flower buds are less than 2 mm. long (for example, *E. brachyandra*, *E. raveretiana* and *E. microcorys*. The sepals are then either shed or, if they remain adherent to the petaline operculum, wither and are torn into fragments during its growth.

In certain species, for example, *E. microcorys*, *E. guilfoylei* (Fig. 4), *E. raveretiana* and *E. curtisii*, post-genital fusion of the margins of the petal primordia is delayed and the lines of fusion of the petals are clearly visible on the mature flower bud; in these species the petals are readily separable with a dissecting needle. In *E. erythrocorys*, in which the petals are all equal in size, the sutures are conspicuously thickened. In at least a few species of the Corymbosae (for example, *E. ficifolia* and, contrary to Willis[18], *E. gummifera*) the petals are not even post-genitally fused and are actually separate in the mature bud, although adherence to the sepaline operculum causes them to be shed with it as part of a single cap.

In immature flower buds the absence of a sepaline operculum may be surmised from the absence of the scar or line which, in species which lose the outer operculum precociously, usually indicates its former line of junction with the petaline operculum; but this criterion must be used with considerable caution. Certain species (for example, some of those in the Corymbosae) retain both opercula until maturity, and others may lose the sepaline operculum when the flower buds are still enclosed in the involucre and so small that no scar is later visible. In *E. lehmanni*, for example, it is necessary to examine buds no more than 1–2 mm. long in order to see the sepaline operculum, which has then ceased to grow. Each flower is sessile and grows through the outer operculum, leaving its disorganized remnants attached to the 'common receptacle' of the inflorescence. This species belongs in the series Cornutae, one of the more obviously natural groups[19], and related species also lose a sepaline operculum early in development, though none so precociously as *E. lehmanni*.

Also deceptive are the four-angled flowers of species such as *E. tetraptera*, which has been placed near the Eudesmieae on the supposition that the tips of the four angles of the calyx-tube represent free sepals. In fact, *E. tetraptera* loses a sepaline operculum in early development[20] and the 'tetrapterous' condition may be merely the result of compression of the young flower bud between its bracteoles (as in *E. globulus*, which loses its sepaline operculum relatively late, and *E. forrestiana*) and is, in any event, not a character common among chorisepalous species. *E. tetraptera* should be placed with the mallees (series Dumosae) which it resembles in its general habit, leaves and cotyledons and stamens.

Relatively few species retain both opercula until anthesis and they are placed in widely separated sections. Some of them comprise the series Corymbosae (bloodwoods) after the removal of the species grouped as the Clavigerae (Maiden) S. T. Blake[5] and, with the exception of *E. jacobsiana*, which is incorrectly placed by Blakely, of the yellow bloodwoods (*E. eximia*, *E. torelliana*, *E. peltata*, *E. bloxsomei*, *E. watsoniana*), all of which lose the sepaline operculum at an early stage in flower development. The yellow bloodwoods (in the restricted sense used above) should be grouped at least as a separate series, for which we suggest the name 'Eximieae'. It has already been suggested[5] that the Clavigerae may not be so closely related to the Corymbosae as has hitherto been thought, and the same suggestion may now be raised concerning the Eximieae. However, other characters (for example, the caoutchouc-like cuticle) peculiar to the bloodwoods (and found also in some species of *Angophora*) may indicate affinities despite the differences in behaviour of the sepaline operculum.

Certain species of the section Terminales also retain both opercula until anthesis. Many of them are placed in the series Siderophloiae which is, however, quite heterogeneous. Most of the species of the supposedly related Heterophloiae lose the sepaline operculum before the flowers reach maturity. The species in this section and in the heterogeneous section Porantheroideae–Normales are among the most 'difficult' in the genus and, as the mode of loss of the outer operculum (which we have found to be constant for a given species) can be readily determined from unopened buds on herbarium specimens, type specimens should be re-examined critically in order to clear up some of the taxonomic muddles. Due warning should be given, however, of the necessity of examining thin sections with the aid of the microscope.

In the majority of species with two opercula, the sepaline operculum is shed either at a very early stage in flower development or at least well before maturity of the bud. This group includes Transversae, Cornutae and Subcornutae, Dumosae and

Exsertae, which are all fairly natural series of the section Macrantherae. It also includes sections Macrantherae–Normales, Graciles, Micrantherae and Platyantherae, a large and heterogeneous group. It is here that the main problems of *Eucalyptus* taxonomy now lie, and further criteria are required to elucidate relationships. To this end we have collected a considerable amount of information on the presence or absence of oil glands in the filaments and of supernumerary glands on the connective or anther lobes, characters which have either not been recorded or not deemed worthy of more than casual reference. In the Cornutae and Dumosae, for example, the filaments have oil glands and there are supernumerary glands on the connective or anther lobes of many of the species of these series, which are probably quite closely related to each other.

While the nature and behaviour of the perianth in *Eucalyptus* remained obscure, comparisons with supposedly distinct but related genera, such as *Angophora*, *Pleurocalyptus* and *Cleistocalyx* were difficult to make and the distinctions between *Eucalyptus* and these genera seemed clear. Both *Cleistocalyx* (*Acicalyptus*) and *Pleurocalyptus* have a sepaline operculum and free petals, which are adherent and are shed together as a cap. This cap often remains attached to one side of the open flower bud. The petals are fringed and highly glandular. All these characteristics are shown by certain members of the Corymbosae. The ovary of *Pleurocalyptus* is semi-superior, as is the ovary in certain species of *Eucalyptus*, for example, *E. deglupta*, *E. raveretiana*. Again, the similarities between the vegetative characters of *Angophora* and those of some species of *Eucalyptus* are striking; the resemblance between *E. jacobsiana* and *E. setosa* and certain species of *Angophora* is remarkable. It is tempting to suppose that *Eucalyptus* has had a polyphyletic origin and that *Monocalyptus*, in particular, has developed quite independently of the rest of the genus.

We wish to thank the Government botanists of Victoria and New South Wales for allowing us access to the State Herbaria. Our thanks are due also to many foresters in Victoria and colleagues at Melbourne for collecting specimens, and to Mr. E. A. Matthaei and Mr. R. Oldfield for assistance with microscopy and photography.

VARIOUS TYPES OF ACQUIRED RESISTANCE TO EXPERIMENTAL 'ALLERGIC' ENCEPHALOMYELITIS

By G. J. SVET-MOLDAVSKY, I. A. SVET-MOLDAVSKAYA and L. I. RAFFKINA

L.A. Tarasevich State Control Institute of Sera and Vaccines, Sivtzev-Vrazhek 41, Moscow

IN our previous communications[1,2] two facts of acquired resistance to experimental allergic encephalomyelitis have been reported, namely, (*a*) after recovery from the conditions and (*b*) after immunization with a mixture of the non-encephalitogenic brain of an embryo or new-born rabbit with the adjuvant.

Prior to our work, three other facts of induced resistance to experimental allergic encephalomyelitis have been described: (1) Ferraro and Cazullo[3] inoculated a mixture of monkey brain with paraffin oil and lanolin (without mycobacteria) in 15 daily doses to guinea pigs. On the fourth day after the last inoculation, the animals were treated with the encephalitogenic mixture. Out of 12 animals, 1 contracted the disease compared with 12 or 13 in the control. (2) Condie *et al.*[4] reported resistance in rabbits 45 days after immunization with homologous spinal cord. (3) Lumsden[5] reported resistance after inoculation with non-encephalitogenic mixtures of an alcohol extract of the brain or adrenals with the adjuvant and suggested that the resistance was called forth by the adjuvant.

Following our publication, Kies and Alvord[6] confirmed Lumsden's suggestion. These workers suggest that in our experiments acquired resistance has been induced by the adjuvant, in particular, by the killed tubercle bacilli.

Our evidence confirms that immunization with the adjuvant alone can indeed account for a certain amount of resistance to experimental allergic encephalomyelitis, but as regards its morphology and mechanism it is to be distinguished from the resistance acquired after recovery from the condition or after immunization with a mixture of embryo brain and the adjuvant.

Experimental proof is adduced below that there are various types of acquired resistance to experimental allergic encephalomyelitis. These types of resistance can be understood from consideration of that acquired by animals after recovery from experimental allergic encephalomyelitis, which makes doubtful the allergic nature of the condition itself. Prior to our experiments, this fact has not been described in the literature, in which even quite opposite results can be found[6]

In the following experiments a somewhat modified technique from that previously described[1,2] has been used a total challenge dose of 1 ml of the encephalitogenic mixture was injected subcutaneously to guinea pigs simultaneously in 5 loci in doses of 0 2 ml In most of the experiments large animals (500–1,000 gm) were used, since they have been found to be particularly susceptible to experimental allergic encephalomyelitis

In the first experiment, 53 guinea pigs were repeatedly treated 1–9 months after recovery from experimental allergic encephalomyelitis with the encephalitogenic mixture Only one case of disease was recorded as against 78–100 per cent in the controls The acquired resistance following recovery could not be transmitted passively via the blood and the cells of the lymphatic nodes and spleen[9]

In the next series of experiments guinea pigs were immunized two to three times with various ingredients, and after 3–6 weeks were challenged with the encephalitogenic mixture

Guinea pigs immunized with a mixture of the brain of new-born rabbits with the adjuvant proved resistant to experimental allergic encephalomyelitis The disease incidence was 0/31 in the experiment and 32/37 in the control (86 per cent) (Here and below the denominator indicates the number of animals in the experiment, and the numerator the number of individuals contracting the disease) After challenge, in the cerebrum of the animals with resistance acquired after recovery from experimental allergic encephalomyelitis and after immunization with a mixture of brain of new-born rabbits with adjuvant there was found the pathomorphological picture of experimental allergic encephalomyelitis without demyelinization along with complete clinical health

The disease incidence among the guinea pigs immunized with the adjuvant alone varies from 0/31 to 4/9 (44 per cent) compared with 32/37 (86 per cent) and 14/18 (77 per cent) in the controls However, in the central nervous system of guinea pigs which have acquired resistance through immunization with the adjuvant alone, no changes have been noted either prior to challenge or after it This resistance apparently does not involve the central nervous system, being merely 'peripheral' This is a resistance to the effect of the adjuvant or, more precisely, to the peripheral mechanisms of induction of experimental allergic encephalomyelitis but not to experimental allergic encephalomyelitis itself which develops in the central nervous system

No resistance has been achieved through immunization with a 50 per cent suspension of the brain of new-born rabbits *per se* or with lanolin and paraffin oil, or with large doses of killed B C G *per se* (200 mgm doses twice in 5 loci) or with lanolin and paraffin oil

Daily injections for 15 days of 0 2 ml of a mixture of adult rabbit brain with lanolin and paraffin oil (Ferraro and Cazullo's method[3]) ensured resistance to the administration of the encephalitogenic mixture on the fourth day after completion of the injections, namely, 2/10 (20 per cent) in the experiment as compared with 7/9 (77 per cent) in the control

The next experimental series suggests the existence of acquired resistance to experimental allergic encephalomyelitis of the interference type Guinea pigs were injected daily for 16 days intraperitoneally or subcutaneously with 3 ml of a 20 per cent cerebral suspension of adult rabbits without adjuvant Between the sixth and seventh injections they were treated with an encephalitogenic mixture The disease incidence in the experiment was 3/16 (18 per cent) and 8/11 (72 per cent) in the control No interference effect was observed on inoculation according to the same scheme (1) with the brain of new-born rabbits , (2) with large doses of killed B C G (16 doses of 250 mgm) , (3) with lanolin and paraffin oil We could not confirm our suggestion[1,2] as to the presence in the brain of new-born rabbits of a factor responsible for the development of resistance to experimental allergic encephalomyelitis and different from the encephalitogenic factor

We could not distinguish the antigens of rabbit embryo brain from the brain of adult rabbits in the anaphylaxis reaction with desensitization, using Zilber's method[8,9]

Multiple daily subcutaneous and intraperitoneal injections of large doses of adult rabbit brain also prevent the contraction of experimental allergic encephalomyelitis when they are started simultaneously with the administration of the encephalitogenic mixture

Moreover, daily 20 intraperitoneal injections of 5 ml of 25 per cent adult brain suspension, started 5 days after the injection of the encephalitogenic mixture, completely prevent experimental allergic encephalomyelitis (0/13 in the experimental group as compared with 12/15 in the control one) Even if treatment with massive doses of the cerebral suspensions started at a later date, it checked the disease

In some experiments single or two-fold intracerebral inoculation of brain emulsion of adult rabbits interfered with the effects of the simultaneous or previous administration of the encephalitogenic mixture

The following types of acquired resistance to experimental allergic encephalomyelitis can be tentatively distinguished (1) acquired resistance of the central type (recovery after the disease, immunization with the brain of new-born rabbits with adjuvant) ; (2) resistance of the interference type (administration of the cerebral substance shortly before or after administration of encephalitogenic mixture) , (3) resistance of the peripheral type (administration of the Freund adjuvant)

We have found recently in the progeny of guinea pigs treated during pregnancy some signs of experimental allergic encephalomyelitis[8–10] This progeny at the age of five months had evidenced some degree of resistance of the disease

FORTHCOMING EVENTS

*(Meetings marked with an asterisk * are open to the public)*

Monday, December 14

Institution of Electrical Engineers (at Savoy Place, London, W C 2), at 5 30 p m —Discussion on "Why Hi-Fi?", opened by Mr P P Eckersley

Society of Chemical Industry, Pesticides Group (at 14 Belgrave Square, London, S W 1), at 5 30 p m —Mr P B Cornwell "Insect Control by Gamma Irradiation"

Royal Geographical Society (at 1 Kensington Gore, London, S W 7), at 8 30 p m —Baron G de Gerlache de Gomery "The Belgian Antarctic Expedition"

Tuesday, December 15

Institute of Marine Engineers (at the Memorial Building, 76 Mark Lane, London, E C 3), at 5 30 p m —Mr K Maddocks "Some Aspects of Marine Reactor Security"

Institute of Physics (at 47 Belgrave Square, London, S W 1), at 5 30 p m —Mr K G Freeman "Tubes for Colour Television"

Institution of Electrical Engineers, Measurement and Control Section (at Savoy Place, London, W C 2), at 5 30 p m —Discussion on "Data Handling Problems in Atomic Installations", opened by Dr D Taylor

Wednesday, December 16

Powder Metallurgy Joint Group of the Iron and Steel Institute and the Institute of Metals (in the Hoare Memorial Hall, Church House, Great Smith Street, London, S W 1) at 9 30 a m —Symposium on "The Powder Metallurgy of Magnetic Materials"

Royal Meteorological Society (at 49 Cromwell Road, London, S W 7), at 5 p m —Dr H Wexler "Seasonal and other Temperature Changes in the Antarctic Atmosphere", Mr W Hitschfeld "Patterns of Hailstorms in Alberta"

Royal Statistical Society (at the London School of Hygiene and Tropical Medicine, Keppel Street, Gower Street, London, W C 1), at 5 15 p m —Sir Hugh Beaver, K B E "Statistics as a Tool of Management" (Presidential Address)

Institute of Petroleum (at 61 New Cavendish Street, London, W 1), at 5 30 p m —Mr A C Hartley "Pipelines"

Institution of Mechanical Engineers (at 1 Birdcage Walk, Westminster, London, S W 1), at 6 p m —Dr S G Hooker "The Future of Air Breathing Engines in Aviation" (James Clayton Lecture)

Society of Chemical Industry, Corrosion Group (at 14 Belgrave Square, London, S W 1), at 6 p m —Discussion of Research Papers recently published by Members of the Group

Society of Instrument Technology (at Manson House, 26 Portland Place, London, W 1), at 7 p m —Mr J F Coales "Random Inputs and Load Variations"

Thursday, December 17

British Computer Society, London Branch (at the Northampton College of Advanced Technology, St John Street, London, E C 1), at 2 30 p m —Discussion on "Conversion between Analogue and Digital Representation"

Society of Chemical Industry, Road and Building Materials Group (at 14 Belgrave Square, London, S W 1), at 2 30 p m and 5 30 p m —Scientific Papers

Institution of Mining and Metallurgy (at the Geological Society, Burlington House, Piccadilly, London, W 1), at 5 p m —Dr A J Robinson "Relationship Between Particle Size and Collector Concentration", Mr D Borchers "Deepening of No 1 Vertical Shaft at Premier (Transvaal) Diamond Mining Co , Ltd "

London Mathematical Society (at the Royal Astronomical Society, Burlington House, Piccadilly, London, W 1), at 5 p m —Prof E V Schenkman "Supersolvable Groups"

Institution of Electrical Engineers, Education Discussion Circle (at Savoy Place, London, W C 2), at 6 p m —Discussion on "The Presentation of the History and Philosophy of Science", opened by Prof H Dingle

Thursday, December 17—Friday, December 18

Physical Society (in the Townsend Lecture Theatre, The Clarendon Laboratory, Oxford), at 10 a m daily—Conference on "Electron-Phonon Interaction in Solids"

Friday, December 18

Society of Chemical Industry, Fine Chemicals Group (at 14 Belgrave Square, London, S W 1), at 6 30 p m —Dr F E Camps "Some Aspects of Forensic Science"

Friday, December 18—Saturday, December 19

British Psychological Society (at University College, Gower Street, London, W C 1)—Conference

Saturday, December 19

Biochemical Society (in the Department of Chemical Pathology, King's College Hospital Medical School, Denmark Hill, London, S E 5), at 10 30 a m —389th Meeting

APPOINTMENTS VACANT

Applications are invited for the following appointments on or before the dates mentioned

Assistant Lecturer or Lecturer in Physics—The Secretary, The University, Exeter (December 19)

Assistant Lecturer or Lecturer in the Department of Zoology—The Registrar, The University, Liverpool (December 19)

Shepherd Research Fellow in the Department of Pathology, for work on immunological problems of ocular disease—The Director, Department of Pathology, Institute of Ophthalmology (University of London), Judd Street, London, W C 1 (December 31)

Scientific Officer (with a good honours degree in botany and experience in plant physiological research) in the Botany Department, to work on physiology of growth and yield of the sugar beet, particularly on the causes of variation between places and seasons in field crops—The Secretary, Rothamsted Experimental Station, Harpenden, Herts (January 1)

Assistant Lecturer or Lecturer in Physics—The Registrar, University College of South Wales and Monmouthshire, Cathay's Park, Cardiff (January 2)

Assistant Lecturer or Lecturer (with an honours degree or equivalent, and preferably experience in hydraulics) in the Department of Fluid Mechanics—The Registrar, The University, Liverpool (January 4)

Lecturer in Biblical Archæology at the University of Melbourne, Australia—The Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W C 1 (Australia, January 4)

Research Fellows (2) in the Department of Geography, Research School of Pacific Studies, Australian National University, Canberra—The Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W C 1 (Australia, January 4)

Research Fellow (with a good knowledge of electronics) in the Department of Physics, to engage in a research programme on spark discharges, in association with Prof J M Somerville—The Registrar, University of New England, Armidale, N S W , Australia, or The Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W C 1 (January 9)

Chair of Physiology in the University of Malaya (Singapore Division)—The Secretary, Inter-University Council for Higher Education Overseas, 29 Woburn Square, London, W C 1 (January 15)

Lecturer or Assistant Lecturer in Pharmaceutics at the University of Malaya (Singapore Division)—The Secretary, Inter-University Council for Higher Education Overseas, 29 Woburn Square, London, W C 1 (January 15)

Chair of Chemistry—The Registrar, University College of Wales, Aberystwyth (January 16)

Lecturer or Assistant Lecturer in Physiology—The Registrar, University College of South Wales and Monmouthshire, Cathays Park, Cardiff (January 16)

Lecturer/Senior Lecturer in Mechanical Engineering at the University of Sydney, Australia—The Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W C 1 (Australia, February 2)

Assistant Director of the Meteorological Department, Ghana—The Director of Recruitment, Ghana High Commissioner's Office, 13 Belgrave Square, London, S W 1

Assistant Lecturer and Demonstrator in Physics—The Secretary, Queen Elizabeth College (University of London), Campden Hill Road, London, W 8

Irrigation Officer (with a university degree in agriculture, or a science degree with agricultural experience, and training or experience in soil physics or irrigation) in Swaziland, to carry out irrigation experiments on sugar cane, citrus and other crops, and to take charge of a new experimental station—The Director of Recruitment, Colonial Office, London, S W 1, quoting Ref BCD 63/76/014/C1

Research Assistant (with an honours degree in electrical engineering or physics) in the Department of Engineering, for an investigation of certain aspects of the high current vacuum arc—The Secretary, The University, Old College, South Bridge, Edinburgh

IMPACT OF SCIENCE AND TECHNOLOGY ON HUMANISM

IN an outstanding oration, "A Balance Sheet for Science and Technology in Europe", delivered before the Conference of European University Rectors and Vice-Chancellors at Dijon on September 9, Sir Eric Ashby examined the proposition that twice in history European civilization has been one fabric, and twice in history the fabric has been torn; science and invention have contributed to its destruction, but in science and invention lies our hope for its repair. The early fabric of European society which the barbarian invasions destroyed was, Sir Eric pointed out, one in which the constant diffusion of ideas produced "a singularly uniform and cosmopolitan civilization throughout the Roman world from which the local and provincial spirit was strikingly absent". Under the impact of these invasions the common language decayed, traffic between the centres of culture diminished, the channels of communication between university and university, city and city, became overgrown and stagnant and Europeans became provincial.

When the traffic of ideas again revived, it was not, however, a traffic between institutions or corporations but a traffic between individual scholars, and the directing influence was no longer theology or the Church, but the New Philosophy and the phenomena of Nature. In the seventeenth and eighteenth centuries, science became one of the threads which held together the fabric of European civilization. A traffic which began between individuals became consolidated in the interchange of publications between scientific societies and academies, and in the nineteenth century science became established in the universities; and the universities began to regain their lost prestige in European life and have once again become centres of high intellectual energy in Europe. Sir Eric rightly stressed the importance of their intercommunications, and especially of those channels of communication which lie in science.

Turning to consider the balance sheet of science in Europe, Sir Eric rejected the view that science is the prime cause of the fear which over-shadowed contemporary life, that science can be held responsible for destroying craftsmanship and cheapening taste, or that mass production and mass communication have made Europe decadent and vulgar. Mankind, he reminded his audience, has always lived in fear, and it is only the sophisticated who suffer from a sense of doom. Again, while science and invention have changed standards for the rank and file of Europeans, the new standards have practically all been improvements; only the sophisticated show a sense of frustration, and that because, while millions are happier through the achievements of technology, they themselves are no longer able to believe in progress.

From such considerations Sir Eric argued that we should not measure the impact of science and invention on Europe by the sophisticated standards of university professors. For the common citizen of Europe, science and invention have neither increased the level of fear nor led to a decay in standards. In drawing up a balance sheet for science in Europe, fear and decadence should not be included on the debit side.

Nevertheless, there are ambivalent effects. For example, improvements in communication have proved of dubious benefit. Indeed, air travel has actually weakened some traditional bonds of understanding; the aeroplane has debased the art of diplomacy and in some ways has initiated the cohesion of Europe. Similarly, in spite of much on the credit side, the effects of mass media have a heavy debit too.

On the credit side of the balance sheet for science in Europe, Sir Eric put first the new interdependence which unites the scientific laboratories of Europe as closely as the cathedrals and priories and abbeys of medieval Europe were united. The clear and undisputed benefit which science confers on Europe, and indeed on the whole literate world, is that it deals in universals. Secondly he put a common faith in science which is shared by thousands of Europeans, and which could become a foundation from which they can explore and understand their differences. The scientists, moreover, are united not only by a common faith but also by obligations to a common faith. Thirdly, Sir Eric put the destruction by the scientific revolution of what he called the tyranny of dogmatic truth, and its replacement by a formula for tolerating error in others. Truth is now tentative, not final and revealed, and it is an integral part of the scientific tradition that this formula does not permit a man to tolerate what he has come to see are errors in his own thinking; it permits him only to tolerate what he believes to be errors in the thinking of his colleagues.

There is indeed substance in Sir Eric Ashby's contention that if there is to be cohesion in Europe, nothing is more necessary than a formula for tolerating error; nor does he exaggerate when he maintains that the scientists and other scholars of Europe comprise a coherent group preserving their national differences but sharing common beliefs and aspirations. It is a precious asset, too, that universities, since they are the chief centres of scholarship in Europe, are united by science into one pan-European community. Nevertheless, the hope for Europe depends upon cohesion among whole populations of Europeans, not solely among a handful of university teachers, and Sir Eric did well to remind us that, in spite of modern universal education, the common man to-day is less in touch with what is best and most significant in European civilization than his ancestors were five centuries ago.

If science is to make its potential contribution to European cohesion, the common man must be helped to understand something of the objectivity, the humility and the tentativeness which characterize a scientist when he is thinking about science This we have, in spite of the mass media, so far conspicuously failed to do, and in the concluding passage of his oration Sir Eric Ashby made several practical suggestions regarding the interpretation of science• Frequently, he believes, such failure is the fault not of the mass media as such but of the interpretation itself, which has been ill-designed for the purpose to be served , and like others he directed attention to the dangers attendant on the immense prestige of science even when the work of the scientist is not understood It must be recognized that science has its failures as well as its successes, that it too has its limitations, and as a small practical contribution to the interpretation of the values of science to the ordinary man, Sir Eric made the sound suggestion that much more could be made of the essential part played by technicians, craftsmen and instrument makers

Here undoubtedly there is a link between science and the non-scientist, and an opportunity to enlist the interest of the man who works with his hands and to convince him that he is not just a spectator, but an essential actor, in the modern scientific age Quite apart, moreover, from that possibility, greater attention to the place and work of the technician and craftsman could have most valuable results in other ways, for the consequent fuller understanding could in turn help the more effective use of scientists and technologists themselves and assist in maintaining a better balance in trained man-power Such considerations should not be overlooked by the universities, and it is to them that Sir Eric Ashby turns in particular for more effective interpretation of science to the common man This, he suggests, is a task for which they should assume greater responsibility and the execution of which they should study intensively He believes that they have here a unique opportunity for influencing the history of Europe, such as has not been theirs since the fourteenth century Like Sir Solly Zuckerman, he emphasized the embarrassing dependence of the decisions of governments on scientists and technologists, many of whom are based upon universities If the universities were able to interpret to the common man the invisible forces which are thus shaping mankind, he believed they could make a notable contribution to the restoration of the fabric of Europe

Sir Eric Ashby did not attempt to indicate further how this task should be undertaken, but it clearly enhances both the regional responsibilities of the universities and puts their extra-mural work in a fresh perspective There are implications, too, for the use and development of the mass media which need urgent exploration , but Sir Eric was careful to disclaim any suggestion that science alone would solve Europe's problems Science can help to spread goodwill and tolerance, but in so doing it is only reinforcing an older and deeper faith the faith of men in mankind

It will be noted that Sir Eric did not suggest that this task of interpreting science so that it can make its full contribution to international cohesion is solely the responsibility of the universities, although he stressed the uniqueness of their part Other institutions have also a part to play, and some of the opportunities were clearly present in Dr A T Waterman's mind when he addressed a Conference for Executives in Federal Science Agencies at Williamsburg on September 14 on science and international affairs Dr Waterman was primarily concerned in this address with the manner in which international scientific activities are organized, but while he stressed the dependence of national security and welfare upon science, he also emphasized the way in which science itself grows and develops without reference to national boundaries

Much of the interest of Dr Waterman's address lies in his account of what the National Science Foundation, of which he is director, is doing to foster international co-operation in science and the interchange of scientific information , but, like Sir Eric Ashby, he referred also to the important part which the scientific societies and learned bodies themselves have to play Dr Waterman, reiterating Dr L V Berkner's comment that such co-operation is still very young and is best conducted by scientists themselves, pointed out the local character of certain kinds of research , and since they arise in a particular place in a particular way, the results cannot be applied universally Dr Waterman, however, was pleading for adequate support for such research from other regions, quoting tropical diseases and antarctic weather conditions, whereas Sir Eric referred to the ecology of alpine vegetation and was illustrating the way in which a narrow definition of the humanities could draw a distinction harmful to scholarship

Nevertheless, Dr Waterman, like Sir Eric Ashby, directs attention to the need for greater knowledge and better understanding both on the part of scientists and of those who serve their country abroad Laymen in all fields should be much more literate with respect to science than in the past, and Dr Waterman urged that universities should be encouraged to include special courses in science for non-scientists Indeed, much more is already being done in that field in the United States than would appear from Dr Waterman's remarks, and both the National Science Foundation and the Science Adviser to the Secretary of State have been active in that field

Even closer to the trend of Sir Eric Ashby's oration is the fifth Dunn Memorial Lecture delivered before the Society of Chemical Industry by Sir Alexander Fleck last May Opening with a tribute to Dr J T Dunn as scientist and humanist, whose life worthily reflected that great concept of humanism which is one of the glories of our Roman heritage, Sir Alexander expounded his view of science and humanism as a background to citizenship Like Sir Eric Ashby, he protested against a narrow definition or conception of humanism, and urged that the humanities must include the great peaks of imagination of the human mind, even if, like the

"Principia" and "The Origin of Species", their subject-matter belonged to science. While science itself is concerned mainly with fields external to man, Sir Alexander rejected the idea that scientists tend to be both lacking in humanity and incapable of appreciating the humanities.

Sir Alexander quoted Einstein's assertion, "Concern with man and his fate must always be the chief aim of scientists"; but although he obviously shares the same comprehensive view of science as Sir Eric Ashby, he did not elaborate on how such a scholarly and objective study of Nature, including man and his works, could become a new cement of civilization. He sought rather to show how the relevance of science and humanism to citizenship could find expression in practical ways. The scientist, he observed, cannot contract out of an interest in human affairs. Neither scientist nor humanist, if versed only in his narrow specialized subject, could expect to see the significance of his work in the widest human context.

Such practical contributions as Sir Alexander described clearly have their own indirect contribution to make to the interpretation of science to the ordinary citizen in the sense indicated by Sir Eric Ashby. Moreover, in its turn the task of interpretation, and perhaps especially that part of it to which Sir Eric summons the universities, has its own practical implications in another way. Both Lord Weeks, speaking as 'special visitor' at the Imperial College of Science and Technology on October 22, and Mr. H. Wilmot, in his fifth Elborne Memorial Lecture to the British Institute of Management on October 30, have recently spoken of the demands made to-day for leadership, and the way in which the universities can help to meet that need.

Lord Weeks, for example, referred to the intangible qualities of mind and personality required to make a man acceptable as a leader, to the call for high intellectual capacity and wide vision as well as for the capacity to understand the latest advances and discoveries of science and technology. Mr. Wilmot formulated even more precisely the nature of the demands made to-day upon those who carry the responsibility of positions of high authority in industry and commerce, and indicated how the universities would increasingly be expected to help provide a continuous supply of those capable ultimately of filling such office. More specifically, Lord Weeks indicated the implications for our educational system of a demand for leaders with such breadth of learning without incurring a debasement of standards.

Lord Weeks was confident that the Imperial College and other universities and colleges of Great Britain can meet this demand; but clearly this is a task to which further thought must be given. Our conceptions of both science and humanism must be sound, and every effort must be made to close that dangerous cultural gap of which Sir Charles Snow has given emphatic warning. Moreover, in the measure in which the universities are the better equipped to provide leaders of imagination of vision and character as well as of intellectual ability and technical skill, they may find it the easier to discharge the responsibility for the interpretation of science to the common man. However that function may be best fulfilled by the universities, whether directly or indirectly, whatever new techniques may be applied, however limited or generous a view is taken of extramural or regional responsibility, a university can scarcely address itself to the task at all unless, within its own walls, the gap is closed, and science has demonstrated its cohesive power and is already binding together a community of scientists and other scholars.

MAN-MADE DRUGS

May's Chemistry of Synthetic Drugs

Revised and rewritten by Dr. G. Malcolm Dyson, in consultation with Dr. Percy May. Fifth edition. Pp. vii+678. (London: Longmans, Green and Co., Ltd., 1959.) 110s. net.

DURING the twenty years that have passed since the last edition of this book our knowledge of synthetic drugs has increased out of all recognition, particularly in the fields of the antibiotics, antimalarials and sulphonamides, where work was stimulated by their military importance.

This has necessitated the re-writing of the whole book. In doing so, the authors have rightly decided to classify the drugs according to their biological activity rather than by their chemical structure.

Though the high standard set by the sensible and well-balanced views on structure and activity relationships expressed in the early chapters is maintained throughout, it is a pity that the reader is not brought quite up to date. The historical background to the various sections is excellent and useful, but some of the more recent work is not included. This point is well brought out by a study of the references. In "Metabolism of Drugs" (Chapter 2) the latest reference is Dittmer and du Vigneaud (1947), while, with the remarkable exception of Borrisov (1994) (*sic*), the most recent reference cited in the discussions on structure and activity is dated 1945. Seventeen of the forty references at the end of this latter chapter were published in the past century.

This fact in no way detracts from the authors' treatment of the subject but serves to illustrate the need for a book of this kind to be written by a panel of authors, each able to give a really up-to-date account of his own particular field. Many of the omissions are possibly due to the same cause. No mention is made of methyl pentynol in the chapter "Sedatives and Hypnotics", or of the oral hypoglycæmic agents—for example, sulphonyl ureas, or the oral diuretic chlorothiazide.

The section dealing with penicillin contains some serious errors. On p. 611, the acid hydrolysis of penicillin is said to produce penicillic acid, instead of penillic acid. Penicillic acid is correctly described elsewhere in the same chapter. In the description of the synthesis of penicillin V on p. 615 the yield for the cyclization of the β-lactam ring is quoted as 75 per cent. The actual figure should be 10–12 per cent; 75 per cent is the yield for the removal of the *t*-butyl group in the previous stage. No mention is made of the important property of acid-stability exhibited by penicillin V. That "it is not known whether valine, cysteine and phenylacetic acid are biochemical precursors of penicillin" is not true in the light of the work by Dr. Arnstein and his collaborators.

In spite of these minor criticisms, the book is well laid out and well printed. Workers in the field of synthetic drugs will sympathize with the authors' problem of how to deal with the many trivial names of a single drug. Though perhaps not bringing the reader quite as up to date with the subject as he might wish, this book will, nevertheless, prove invaluable as a reference work to those interested in the chemistry and activity of synthetic drugs.

F. R. BATCHELOR

MICROBES ON THE MOVE

Biochemical Engineering

Unit Processes in Fermentation. Edited by Dr. R. Steel. Pp. 328. (London: Heywood and Co., Ltd., 1958.) 50*s*. net.

Progress in Industrial Microbiology

Vol. 1. Edited by Dr. D. J. D. Hockenhull. Pp. viii+248. (London: Heywood and Co., Ltd., 1959.) 50*s*. net.

SINCE the advent of the commercial production of antibiotics in the 1940's, the application of micro-organisms to industrial purposes has been given a new stimulus, which has more than compensated for the declining importance of fermentation processes for the production of such materials as alcohol, acetone and butanol under the impact of the petrochemicals industry.

These two publications represent the first attempt in Great Britain to collect within a reasonable compass some of the vast store of information in this field. As such they will be welcomed by all whose pre-occupation with a particular aspect limits their view of the horizon.

Steel's book is based on a series of lectures given in Manchester in 1957 by a panel of speakers, who, for the most part, have considerable experience in research or in the industrial applications of microbiology. Its scope is limited essentially to the fermentation industries, which cover only part of the activities of the biochemical or biological engineer. This is clearly seen by comparing the coverage of this volume with the topics mentioned in the introductory chapter on "The Scope of Biochemical Engineering". Only one chapter is contributed by chemical engineers practising in this field, and this is concerned largely with mechanical engineering design. Its title is, therefore, a misnomer. Nevertheless, it provides an introduction to a field in which chemical engineers are likely to be increasingly involved. Indeed, its very limitations should act as a stimulus to a more forthright chemical engineering approach. The book will also serve to give those entering this field some notion of the problems and approach of the biochemist and biologist, and of the multifarious activities of the ubiquitous microbe.

The second book, from the same publisher, is the first volume in what promises to be a valuable series. The topics chosen represent a good balance between the more academic approach of the 'pure' microbiologist and biochemist on one hand, and the needs of microbiological technology on the other. The balance is maintained in the chapters on the tetracyclines, microbial fat and riboflavin synthesis. The editor himself contributes an authoritative review of the influence of the constituents of the medium on the biosynthesis of penicillin, and pays a well-deserved tribute to Dr. Bisset for his "lucid and beautifully illustrated article" on the saprophytic Actinomycetes. Finally, an article on microbiological assay not only surveys the common laboratory techniques but also includes a section on statistical analysis, showing clearly the influence of this approach in the actual operation of the assay laboratory. The standard set by this volume, and the list of topics mentioned for review in forthcoming volumes, should ensure a wide and continuing interest in the series.

N. BLAKEBROUGH

THE PERIODIC LAW

Periodic Law

By D. I. Mendeleieff. Edited by B. M. Kedrov. Pp. 830 (Russian text). (Moscow: Acad. Sci. U.S.S.R., 1958.) 33 r.

THIS valuable and substantial volume containing Mendeleieff's publications relative to the Periodic Law represents a publication quite independent from Mendeleieff's "Scientific Archives" reviewed in these columns in 1955 (*Nature*, 176, 965; 1955), the first volume of which was published in 1953, while the second and the third volumes remain as yet unpublished. The present volume belongs to the series "Classics of Science" and is apparently entirely due to the initiative and labour of B. M. Kedrov, assisted by the late T. N. Chentzova.

The first section of the book contains reprints of fifteen "Principal Articles" by Mendeleieff relating to the Periodic Law. Actually the first item of this collection is not an article at all but a copy of the first issue of the Periodic Table (March 1, 1869). Besides this copy the book contains a large number of photographic and printed reproductions of different variants of the Periodic Table.

The second item in this collection is the first article of Mendeleieff dealing with the Periodic Law published in the *Journal of the Russian Chemical Society* (1, pp. 60–77; 1869). This is followed by a number of shorter articles and then by the Russian text of the German article entitled "Die periodische Gesetzmassigkeit der chemischen Elemente" published in *Liebigs Annalen*, 1871, Supp. VIII, Heft 2, pp. 133–229. Extracts from this article were published by W. Crooks in the quarterly *Journal of Science*, No. 55, (1877), and a full translation in the *Chemical News*, 40 (1879), and 41 (1880). According to Mendeleieff himself, this article presented "the best summary of my views and arguments on the periodicity of the elements and was the main text used for the numerous comments on this system. This article was the main cause of my renown as a scientist". Short papers on peroxides follow with others on the atomic weight of yttrium, the cerium group of metals, gallium and the rare metals. Number thirteen is the Russian text of the Faraday Lecture entitled "The Periodic Law of the Chemical Elements". The lecture was delivered by Mendeleieff on May 23/June 4, 1889, before the Chemical Society in London (*J. Chem. Soc.*, 55, 634; 1889). The remaining items are an article from the Russian Encyclopædia of 1898, and an extract from the "Principles of Chemistry", 1906 edition.

The section entitled "Additions" contains a miscellaneous collection of Mendeleieff's articles of lesser importance, notes, letters and extracts from books, all of them related to the Periodic Law The items in this section are arranged in groups labelled *A* to *J* Briefly their contents are (*A*) collection of periodic tables and other tables of various dates (1869–1906) as they appeared in the successive editions of the "Principles of Chemistry" , (*B*) extract from the first edition of the "Principles" (1870–71) , (*C*) a group of three articles, one from *Le Moniteur Scientifique*, 9, 691 (1879) , and two from *Berichte d chem Ges* , 4, 348 (1879) and 13, 1796 (1880), dealing with the history of the Periodic Law and the controversy with Lothar Meyer , (*D*), (*E*) and (*F*) are miscellaneous extracts , (*G*) extracts relating to the discovery of the inert gases and radioactivity (1895–1905) , (*A*) a collection of various items including the Russian text of the lecture read on May 19 and 31, 1889, at the Royal Institution in London, and entitled "An Attempt to apply to Chemistry one of the Principles of Newton's Natural Philosophy" (*Chemical News*, 40 (1889) , (*I*) miscellaneous extracts , (*J*) extracts from Mendeleieff's earlier works (1855–61) relating to the preparatory work in connexion with the future discovery of the Periodic Law

The last section of the book is entitled "Supplements" (pp 675–825) It contains a varied assemblage of very valuable editorial notes, commentaries, bibliographical and biographical data, two coloured reproductions of Mendeleieff's portrait and a very interesting article by B M Kedrov, "The Periodic Law of Mendeleieff and the World's Science"

S I TOMKEIEFF

X-RAY POWDER METHODS

The Powder Method in X-ray Crystallography

By Prof Leonid V Azároff and Prof Martin J Buerger. Pp xv+342 (London McGraw-Hill Publishing Company, Ltd , 1958) 68*s*

THE appearance of this authoritative work on the X-ray powder method is very welcome It is more compact than some other works that have been produced recently, but is nevertheless exhaustive enough for most research workers, and the extensive references give ample guidance for further reading

The exposition of basic ideas bears the clear mark of experienced and thorough teaching , the stress laid upon the reflexion concept in Bragg's treatment of X-ray diffraction is particularly noteworthy since so many text-books gloss over this important point The book also contains ample experimental detail and advice on various techniques to help both the beginner and the more experienced student The section on interpretation and indexing is particularly good

The only adverse criticism that might be made is that the book tends to lay down American practice as final and complete There are several points in which practice differs from that in Great Britain, and the American practice is not always as logical as it is made to appear in this book For example, cameras in Britain are 9 and 19 cm in diameter , in the United States they are 5 7 and 11 4 cm Although there is some arbitrariness in the former figures, they were designed to give films just less than 30 cm in length since comparators of 30 cm were readily available The American radii give a simple number of millimetres per degree , but the reviewer has never met anyone who makes use of this property for rough work one uses *d* scales directly, and for accurate work film shrinkage must be allowed for

Secondly, the Americans use the Straumanis design because the camera does not need to be calibrated But this design is rather awkward, and the calibration of cameras is not particularly difficult Certainly the Straumanis design does not lead to higher accuracy , the authors claim 2–4 parts in 10^5 as a limit, but Bradley and Jay were achieving this accuracy in 1932

Thirdly, the Americans make considerable use of accurately fitting slides, whereas British cameras use kinematic supports Consequently, the former need individual supports for each camera, whereas kinematic design allows for much more flexibility

These points, however, merely indicate that the subject is a living one, in which there are still many points of divergence between different practitioners The book can be thoroughly recommended

H LIPSON

GLOVE BOXES AND SHIELDED CELLS

Glove Boxes and Shielded Cells for Handling Radioactive Materials

A Record of the Proceedings of the Symposium on Glove Box Design and Operation held in the Cockcroft Hall, A E R E , Harwell, February 19–21, 1957 Edited by G N Walton (Sponsored by The United Kingdom Atomic Energy Authority, Harwell) Pp. xii+515 (London Butterworths Scientific Publications , New York Academic Press, Inc , 1958) 95*s* , 16 80 dollars

AS one of the authors remarks, one of the most difficult problems facing the worker with radioactive materials is to decide what degree of protection is appropriate to his particular circumstances The introductory chapters of this book provide useful basic data and discussions of principles, which should be helpful in determining a logical and realistic policy for the use of glove boxes The fundamental requirements of radiological protection have not changed appreciably since this Conference was held in 1957, but the reader should bear in mind that controls have tended to become more stringent meanwhile, particularly in the higher ranges of activities

For alpha emitters and the more toxic isotopes generally, complete containment of the material in a glove box or similar enclosure is essential The majority of the papers in this symposium are concerned with this aspect, and together they form an extensive review of practice which is now fairly well established. Many aspects of design are covered by contributors with first-hand experience of them, such as materials for construction, radioactive decontamination, filtering systems and the use of inert atmospheres The papers are mainly drawn from experience within the U K Atomic Energy Authority, but there are also some excellent reviews of practice in the United States and other countries The techniques described here are for use with radioactive materials, but they may also be of interest in connexion with other work where critical control of environment is necessary, as in dust-free or aseptic procedures

For isotopes which emit penetrating radiations the operations become much more complex, as shielding must be superimposed on the requirement of containment. The choice of system, whether it should be tongs in shielded boxes or manipulators in cells, is correspondingly more difficult. The second part of the book is concerned with such problems, and it contains a lot of useful data for design as well as practical experience in dealing with highly active materials up to the 1,000 MeV curie level. It refers particularly to work with fission products and irradiated metallurgical specimens. This part is necessarily rather less satisfactory than the first, because these techniques are at present developing more rapidly than those for handling alpha emitters.

The book is well produced, and one appreciates the heavy task of the editors and publishers in attaining this result. Nevertheless, there is much to be said in favour of adopting a simpler, cheaper and quicker form of publication for the proceedings of symposia such as this one.

MATRIX ALGEBRA IN STRUCTURAL ANALYSIS

Linear Structural Analysis

An Introduction to the Influence Coefficient Method applied to Statically Indeterminate Structures. By Prof. P. B. Morice. Pp. xii+170. (London: Thames and Hudson, Ltd., 1959.) 35*s*. net.

ONE of the most important advances in the theory of elastic structures during the past few years has been the development of matrix methods of analysis. This work has been considerably stimulated by the advent of automatic digital computers, since these machines are very well suited to the manipulation of large matrices.

Methods of structural analysis may be divided into two groups. The first, often termed 'equilibrium' or 'stiffness' methods, consider joint displacements as the basic unknowns, and proceed by setting up and solving the equations of joint equilibrium. The second group, known as 'compatibility' or 'flexibility' methods, attack the problem in terms of the redundant forces and moments in a structure, determining these by equations of displacement compatibility.

Prof. P. B. Morice's book is entirely devoted to the second of these two approaches. He commences by discussing general energy theorems, influence coefficients and indeterminacy. The treatment of the latter subject follows recent work by Henderson and is extremely thorough. The central section of the book presents a short account of matrix algebra and the associated numerical techniques, described from the point of view of a human computer using a desk calculating machine. After this the flexibility coefficient method of analysis is presented in matrix notation, with examples of its use in particular cases. The book concludes with a brief account of the way in which matrix work can be carried out on a *Pegasus* computer.

The development of matrix methods of structural analysis is by no means complete, and the theoretician will doubtless find that many of the ideas presented in this book are capable of further generalization and extension. Although the conciseness and generality of matrix notation are well displayed, there are several places where unusual symbols (such as x and n for force vectors) make the text more difficult than it might have been for a newcomer to the subject. There are also a few misprints which suggest rather hurried proof reading.

From the short title on the cover, and various paragraphs in the preface and introduction, the reader with a limited knowledge of structural analysis might well assume that the best, if not the only, way of using matrices in structural analysis was by means of the flexibility methods described in this book. The book would have been a very much more valuable one if it had contained a parallel account of the equally important stiffness methods of analysis, with demonstrations of the relative merits of the two approaches in a number of examples.

R. K. LIVESLEY

THE GEOLOGICAL DEVELOPMENT OF NORTH AMERICA

The Evolution of North America

By Dr. Philip B. King. Pp. xvii+190. (Princeton, N.J.: Princeton University Press; London: Oxford University Press, 1959.) 60*s*. net.

THE publication of a book which collates and interprets the considerable number of available facts concerning the regional geology of North America can be expected to be a notable event when the author has the background of Dr. P. B. King, with wide and long experience in the United States Geological Survey and interests covering tectonics, stratigraphy and physical geology. The story of the growth of the northern part of the American continent is not treated chronologically but regionally, with emphasis on selected areas of the United States. Although the book arises from lectures to graduates, the author explains that it is not a text-book in the usual sense; prominence is given, however, to 'Reference Material', a list of maps and books, which receives precedence over 'Contents' and is supplemented by 'References' (which are not referred to in the body of the text) at the end of each chapter.

After an introductory chapter addressed mainly to the layman, the Canadian Shield is treated in broad outline. When he turns to consider the Interior Lowlands, Dr. King is able to draw on his personal experience of field work in the West Texas Basin, and in the chapter on the Appalachians his close acquaintance with the complexities is evident. Valuable comments on geosynclines and the growth of the Appalachians, stemming from earlier publications by the author, are followed by examination of modern analogues of geosynclines around the Gulf of Mexico and the Caribbean. The second half of the book examines the mountain chains and intermontane regions in the west, largely in the United States. The complex subdivisions of this belt are clearly outlined and interesting notes and anecdotes concerning its exploration are included.

The geological maps and sections are admirably executed, and the sketches by Trudy King above chapter headings add a pleasing touch. The typography can only be criticized in details; sub-headings tend to become obscured in the text and the list of contents (pp. xi–xiv) suffers from lack of variation in fount and insufficient indentation of sub-headings.

Dr. King succeeds, with a fresh and stimulating approach, in outlining a great deal of the structural framework of North America but is only partially successful in fulfilling the promise implied by his title with respect to historical geology.

J. W. COWIE

Advances in Electronics and Electron Physics

Vol 10 Edited by L Marton, assisted by Claire Marton Pp x+320 (New York Academic Press, Inc , London Academic Books, Ltd , 1958) 10 dollars

A DIVERSITY of subjects has always been a feature of previous volumes of the series of reports on "Advances in Electronics and Electron Physics" (the last three words having been added after Vol 5) Papers on physical effects and on the preparation and properties of materials have been freely intermingled with others describing the methods of designing, making and using devices and with theoretical analyses The tenth volume is no exception , indeed, the diversity may be thought to be excessive Thus, the paper on the logical organization of computers, well written though without recourse to a single diagram or mathematical expression, is perhaps too remote from another which analyses electron flow in magnetically focused cylindrical beams and which is unlikely to attract the attention of anyone not engaged in designing or using micro-wave valves Three papers should be widely approved The first deals with defects in crystals of semiconductors with the diamond lattice, a subject which has benefited from the availability of large crystals of germanium and silicon The second shows how micro-wave engineers have adapted, and can still further adapt, techniques from optics The third describes recent progress with the design of cathode ray oscilloscopes (Is this the one remaining use of the words 'cathode ray' ?) Partly because their early role of presenting recurrent wave forms has long been extended to transient phenomena, and they are easy to use, these flexible instruments are now found in almost all branches of science, and a few of the arts, and their design, capabilities and limitations deserve the widest recognition The sixth paper, on the reliability of valves, can for the most part be appreciated only by valve engineers, but the sections dealing with reasons for failure and action to improve life are of more general interest J R Tillman

Second Symposium on Coal Preparation, Department of Mining, University of Leeds

21st to 25th October, 1957 Pp xii+513 (Leeds The University, 1959 Distributed by the Coal Preparation Plant Association, 301 Glossop Road, Sheffield 10) 20*s*

COAL preparation may be regarded as a collective term for those processes, mainly physical and mechanical, to which coal may be subjected in order to make it suitable for specific use These processes include hand cleaning, hand selection, blending, screening, breaking, crushing, pulverizing, wet cleaning, dry cleaning, de-dusting, dust proofing, drying, de-watering, froth flotation and briquetting Aspects of several of these processes were discussed at a Symposium held at the University of Leeds, the proceedings of which contain eighteen papers, a detailed record of the discussions on each paper and summaries of rapporteurs on each of the four groups of subjects in which the papers may be classified

The subjects dealt with range from trends in the pattern of coal preparation to traffic control and wagon marshalling at colliery and coal preparation sidings, and include size distribution equations, sampling, problems of moisture and moisture retention in coals, aspects of certain processes—including dense-medium cleaning and stratification in jig washers, principles and practice of froth flotation, washery water, testing and performance of coal preparation plants, and briquetting

There is a balanced combination between the various papers of basic principles, research and industrial practice The publication is a valuable addition to the literature of coal preparation

S G Ward

A History of Western Technology

By Friedrich Klemm Translated from the German by Dorothea Waley Singer Pp 401+24 plates (London George Allen and Unwin, Ltd , 1959) 32*s* net

THIS is a book of much interest, but its title is misleading It is in fact an anthology consisting of 219 passages on technological topics selected from contemporary writings Since inventors and engineers have not always written about their work or writers concerned themselves with contemporary technological developments, a history based solely on original writings must appear somewhat defective and unbalanced The compiler, who is the librarian of the Deutsches Museum, Munich, has therefore attempted to give a continuous account by supplying connecting passages and an introduction to each chapter

The extracts are chosen with the view of depicting the atmosphere in which technological advance took place rather than describing the technology itself Owing to the lack of earlier material the story only begins with ancient Greece , and, on the other hand, the treatment of the past hundred years is very selective and brief

The reader is offered much interesting material which he may not know of or trouble to translate for himself Thus there is Filarete's description of a visit to an ironworks in 1464, the extracts from the proceedings of the Nuremberg Council in relation to the inconvenient inventiveness of two of the red-metal turners living there in the second half of the sixteenth century, and the observations of Fischer, Schinkel, Beuth, and Harkort, German visitors to Britain in the nineteenth century The book is well illustrated with 59 line drawings and 24 half-tones

K R Gilbert

Principles of Geochemistry

By Prof Brian Mason Second edition. Pp viii+310 (New York · John Wiley and Sons, Inc , London Chapman and Hall, Ltd , 1958) 68*s* net

THE second edition of this excellent introduction to geochemistry follows the same general lines as the first, but although no major changes have been made, changes in detail are numerous Many of the data in the first edition have been replaced where possible by the more reliable figures that have become available during the past six years, and results of recent work have been incorporated in the text The number of tables and text-figures has been increased and the bibliographies at the end of each chapter have been revised and brought up to date A new and welcome feature is the introduction of two appendixes, one giving atomic weights, atomic numbers and ionic radii of the elements, the other giving a geological time-scale

This is a useful text-book for students, and it is unfortunate that the price has had to be increased to such an extent S R Nockolds

THE BOTANIC GARDENS, SINGAPORE, 1859–1959

By H M. BURKILL

Director, Botanic Gardens, Singapore

IN this year of significance in the political history of Singapore, the Botanic Gardens at Singapore celebrate the centenary of their founding Centenaries are in the air and they are in good company their elder sister at Kew has just observed a bicentenary, Kuala Lumpur, the capital city of the Federation of Malaya, in which and for which territory these Gardens have done so much of their work, has this year attained its century, and, if one might stretch a biological association, so has the Guinness Brewery

The present Gardens are the last of three The first were set up by Sir Stamford Raffles in 1822, when the East India Company settlement was but three years old These lasted until 1829 when, on a false notion of economy, they were abandoned They were resuscitated in 1836 by an Agri-horticultural Society which ran them until 1846 In 1859 another Agri-horticultural Society with official blessing took possession of land which is now a part of the present Gardens

The intention behind all these Gardens was to foster and encourage the agriculture of the fast-expanding Colony The first Gardens introduced and grew possible economic crops, but chiefly nutmegs, cloves and cacao The second Gardens managed to recoup its expenses on the sales of nutmegs and cloves Though the intention of the 1859 Agri-horticultural Society was also to give encouragement to local agriculture, it set about first creating a pleasure garden Perhaps this was an economic necessity in order to attract membership, for membership carried privileges After the pleasure garden got under way, the superintendent, Lawrence Niven, who designed and carried out the landscaping, was able to turn his attention to growing fruit, vegetables and flowers for distribution to members

The Society soon found itself in financial difficulties, and bit by bit Government assistance became a bigger item in its budget In 1869, at the invitation of the Committee, the Government appointed a representative to the Committee and increased its contribution on condition the Society exhibited living specimens of economic plants In order to add popular attraction, a zoo was established in the Gardens at this time, which lasted until 1905 Finally, in 1874 the Committee requested the Government to take over the Society's assets and liabilities and to run the Gardens out of public funds The Government agreed, and from January 1, 1875, to this day the Gardens have been an official department

This change in management brought with it a change in purpose The Government sought to broaden the scope of work to include a study of the flora of the Malay Peninsula, and instructed the committee of management to obtain the services of a botanist who was also a practical man Henry James Murton was engaged and arrived in Singapore in 1875 In the five years he was superintendent, until 1880, when he was dismissed for neglect of duties, he achieved much, but mainly what interested him He greatly extended the range of plants grown in the Gardens, he corresponded and exchanged with other Gardens, he travelled in the Malay Peninsula and began a herbarium, he drafted in manuscript a Flora of Singapore Perhaps the most significant of his works was his handling of the first *Hevea* seedlings to be established in Singapore and Malaya in 1877, the progeny of which in very large measure have stocked the plantations of south-east Asia He also established many other plants of possible economic importance, and in 1879 he began planting in the land to the north of the Gardens, later known as the Economic Garden and now part of the grounds of the University of Malaya

Nathaniel Cantley followed Murton, arriving in Singapore in 1880, but he soon became sick and his subordinate, Walter Fox, was left in charge, as he was during the interim between Murton's departure and Cantley's arrival Cantley returned in 1881, and in the next year the Government commissioned him to survey the forests of the Straits Settlements As a result, a Forest Department was formed with Cantley as its head and with officers in the three settlements of Singapore, Penang and Malacca, and later in the Dindings Cantley planted an arboretum in the Economic Garden to have on hand local trees To these he added exotics In the Gardens he made great changes in layout and arranged the planting according to taxonomic classification In 1887 his health broke down and he died

The appointment of Henry Nicholas Ridley in 1888 as director marked the opening of another chapter in the history of the Gardens He was a man of tremendous energy and capacity for work, and even though he had an admirable foundation to build on, he pushed the Singapore Botanic Gardens to the forefront of international botany His interests were manifold A brief biography by J W Purseglove was published in *Nature*, 176, 1092 (December 10, 1955) on the occasion of his hundredth birthday Ridley travelled far and wide in Malaya and in the region His collecting was prodigious and he advanced the knowledge of the Malayan flora to such an extent that when he wrote his "Flora of the Malay Peninsula" (published 1922–25) after his retirement, it filled five thick volumes of 2,948 pages During the earlier part of Ridley's directorship the Gardens continued to administer the forests of the Straits Settlements, but a separate Forest Department was set up in 1901 The Gardens work on economic crops grew, and agriculture in Malaya developed to such an extent that a separate Agricultural Department was established in 1904, but the Gardens continued to publish an agricultural periodical, begun in 1891, until 1912 (*Agricultural Bulletin of the Malay Peninsula*, 1891–1900, *Agricultural Bulletin of the Straits and Federated Malay States*, 1901–12)

Perhaps the most spectacular work of the Gardens during Ridley's time was that on rubber. When Ridley arrived he found nine mature trees, some fifty which were 2–4 years old, and more than a thousand seedlings. Ridley experimented on means for their exploitation, persisting even in the face of official disapproval. His tapping technique remains fundamentally unchanged to this day. The Gardens planted *Hevea* in forest clearings and on waste ground, so that when the planting rush came at the beginning of this century the Botanic Gardens was the only major source of supply of seed. Up to 1917, when the Gardens ceased selling seed, more than 7 million had been distributed. Though *Hevea* holds the limelight, the Botanic Gardens have been responsible for the introduction and distribution of many other economic crops.

With Ridley's retirement in 1912, Isaac Henry Burkill, who had been adviser on economic botany to the Government of Bengal, came as director. The First World War hampered development and limited staff, but interest in plants of economic value was maintained. The Agricultural Department naturally held the established economic crops within its purview, but the Gardens continued to be a source of supply of many. A list of plant material available for sale dated 1916 had 200 species, but the loss of the Economic Garden in 1924 for the building of a college for higher education meant the end of this work. During his directorship, I. H. Burkill travelled much, particularly after the war years, and amassed a great quantity of data on native uses of plants. He specialized on *Dioscorea*, native medicines cultivated plants and ethnobotany.

At the end of the First World War, T. F. Chipp was appointed assistant director and he extended the work of the Department to the Cryptogams (fungi); but he soon transferred to West Africa. R. E. Holttum was appointed to the vacancy in 1922, a condition of the appointment being that he should study a group of plants different from that covered by the director. Holttum began a study of the ferns, which he has made a life-work, and now in retirement he is preparing a monograph of the ferns for "Flora Malesiana", a work which will take him perhaps ten years to accomplish.

In 1924 the Gardens benefited by the cessation of botanical work at the Perak Museum at Taiping, and M. R. Henderson joined the staff as curator of the Herbarium. The Perak Museum Herbarium followed him to Singapore and was incorporated with the Singapore Herbarium in 1926.

I. H. Burkill retired in 1925 and at once commenced to write "A Dictionary of the Economic Products of the Malay Peninsula", which eventually took him ten years to complete. Unfortunately, only 2,000 copies were printed and it has long been sold out. Such is its value to all tropical botanists and agriculturists that it is hoped to reprint it.

With the surrender of the Economic Garden in 1925, the Botanic Gardens lost its immediate contact with economic agriculture and forestry, and the work became more concerned with ecology, taxonomic botany and horticulture. In the last field, under the

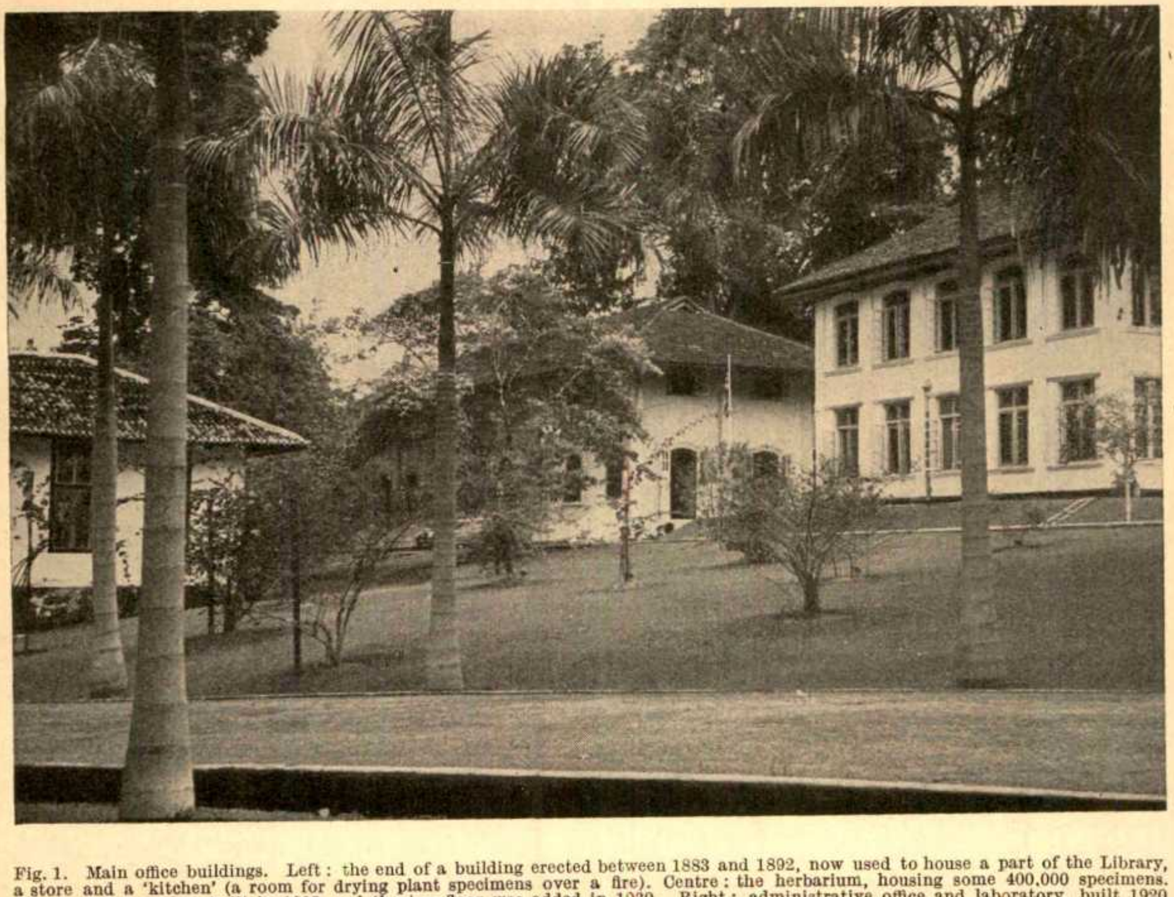

Fig. 1. Main office buildings. Left: the end of a building erected between 1883 and 1892, now used to house a part of the Library, a store and a 'kitchen' (a room for drying plant specimens over a fire). Centre: the herbarium, housing some 400,000 specimens. The ground floor was built in 1903, and the top floor was added in 1930. Right: administrative office and laboratory, built 1920

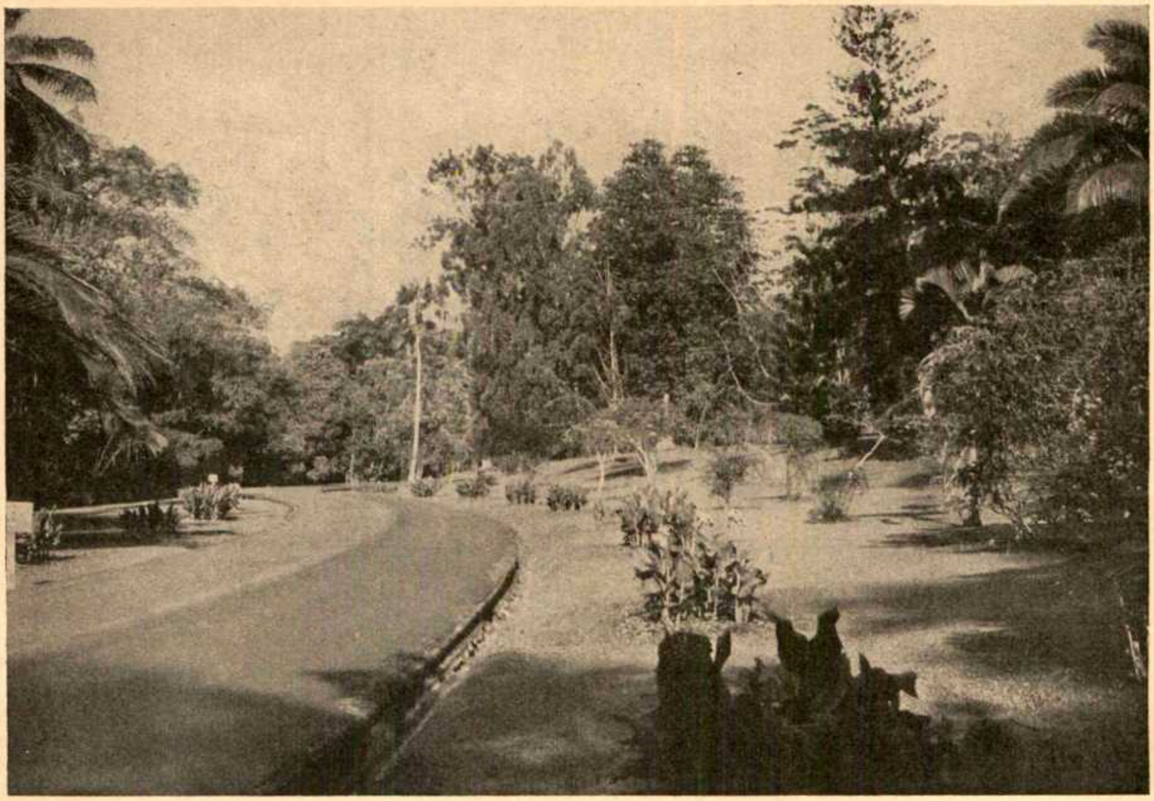

Fig. 2. Gardens from inside the main gate. Beds of hybrid cannas flank the road. To the right are collections of bougainvilleas, conifers and casuarinas

directorship of Holttum, a programme of hybridizing was begun, particularly with orchids, which has continued to this day with undiminished vigour. This work has given rise to a thriving orchid nursery industry with an increasing export trade and to an extremely active band of amateur orchid fanciers and breeders throughout Malaya.

In the botanical field, Holttum worked not only on ferns but also on bamboos, gingers and, naturally, on orchids. Henderson specialized on the limestone flora of Malaya, Myrtaceae and *Callophyllum*. He wrote "Malayan Wild Flowers" in two volumes, which was published by the Malayan Nature Society. E. J. H. Corner, who joined the staff in 1929, worked on fungi, trees and ecology, and especially on the genus *Ficus*. C. X. Furtado, who came in 1923, studied palms, aroids and other groups of monocotyledons. Specialist work of the Botanic Gardens was thus well diversified and had in addition the benefit of collaborators such as Carr (orchids), Foxworthy (F.M.S. Forest Department, forest trees), and many others. This period of increased taxonomic study continued up to the outbreak of the Second World War and is recorded by a not insubstantial run of issues of the Botanic Gardens periodical, *The Gardens' Bulletin*.

With the restriction of botanical work during 1942–45, the Botanic Gardens were indeed extremely fortunate to have been sent from Japan successively Profs. Hidezo Tanakadate, of Tôhoku Imperial University, and Kwan Koriba, of the Imperial University of Kyoto, as director. No loss was suffered in the Library or in the Herbarium, thanks to their efforts. Holttum, Corner and Furtado were retained to work in the Gardens, and it was perhaps some compensation that Holttum and Corner, relieved of administrative and executive responsibilities, were able to devote their almost undivided attention to revision and preparation of monographs. There is no doubt that this break afforded Holttum the opportunity which otherwise would not have come to him, perhaps until after retirement, to prepare draft manuscripts for Vols. 1 (Orchids) and 2 (Ferns) of the "Revised Flora of Malaya", which were published after the War ; "It is an ill wind . . .". It is significant that, like Holttum, both Ridley and I. H. Burkill completed their major literary works after the close of their official careers.

The post-war years have been marked by shortage of staff. This and the state of terrorism in the Federation of Malaya have severely limited botanical exploration. But now more extensive field-work is possible. Greater use is being made of subordinate staff on plant-collecting assignments. Trained Malayan personnel for appointment in both the botanical and horticultural sections of the Gardens is now available, and there is prospect for regaining a full establishment. This is essential so that the Department may add its vital contribution to the economic development of Malaya and the region. The field is immense. Current estimates for the compilation of "Flora Malesiana", in which project the Botanic Gardens is a major collaborator, run into decades. The achievements of the Gardens' first century have been impressive, but the field for the second century paradoxically is increasing. The more we learn, the more we find we have yet to learn.

INTERNATIONAL OCEANOGRAPHIC CONGRESS

IN spite of the increasing application of scientific discoveries to development of weapons and to enhance national prestige, we can still maintain that science is one of the most international of intellectual activities, and hold that anything we can do to promote co-operation is likely to contribute to better understanding between nations If not generally true, it must still be so for the study of the oceans, with its very wide and numerous bearings on human welfare, and it seems very appropriate that the first International Oceanographic Congress, which took place during August 31–September 11, should have been held in the United Nations headquarters in New York , also that it should be sponsored by the American Association for the Advancement of Science, which has ably demonstrated the part science can play in raising the level of economic prosperity, and by Unesco, which strives to spread the educational, cultural and practical benefits to all nations Oceanographers have a tradition of working together, and have a number of intergovernmental councils and scientific associations to help them, but this was probably the first time such a grand attempt had been made to assemble enthusiasts from every aspect of the subject and all parts of the world

The aim was to get to know and help each other, and the programme was arranged around five main topics · "History of the Oceans", "Populations of the Sea", "The Deep Sea", "Boundaries of the Sea", and "Cycles of Organic and Inorganic Substances in the Sea". Each theme had two morning sessions, with lecturers invited to review contemporary advances rather than the older published work, and in the afternoons the audience divided among four discussions of papers related to the morning topics The main purpose of the conference seemed to be very well achieved a great deal of unpublished work was discussed and new ideas freely exchanged Everyone writing about it will be sure to say how wonderful was the exchange of information between people who knew each other or had read each other's papers The success was largely due to the efforts of the organizing committee, which persuaded oceanographic laboratories all over the world to send the younger members of their staffs as well as directors, and to the generous financial help of some twenty-two government and private organizations in the United States, which overcame much of the difficulty of travel expenses

The "History of the Oceans" section dealt with the shape and structure of the ocean basins, the forces involved, the history of sea water, and the origin of life We begin to know enough about the topography of the Atlantic and Pacific Oceans to form a reasonable overall picture and to know where to study the processes at work Earthquake activity, vulcanicity, gravity and magnetic anomalies are beginning to be related to topography The abyssal plains are as interesting as the ridges We still do not know whether continental slopes are rubbish tips or weathered rock We were warned against too ready acceptance of generalizations attributing all acid rocks found in dredges to transport by ice There should be more active studies to see if they could be locally derived, and to see if they can be dated , we were told to be careful about giving them to museums Another caution, from the biologists, was that while those dealing with living material are very careful about drawing conclusions beyond simple description or regional relationships, palæographers showed less hesitation in making positive deductions about ancient seas The physicists agreed that the difficulty of finding hypotheses to explain the present circulation of the oceans made it quite fantastic to put forward conclusions about those of earlier climatic periods There are, nevertheless, very exciting attempts to obtain evidence from the stratigraphy, chemistry, physics, biology and nuclear relationships of the sediments The same types of evidence, and increasingly penetrating studies of the chemistry of sea water and of its exchanges with the sediments, are also beginning to provide a better framework for judging ideas on the origin of life in the sea

In "Populations of the Oceans", most of the papers and discussions were on biogeography, distribution and behaviour in relation to physiology and environment, evolution and adaptation, and palæobiogeography One of the morning lectures was a fascinating unpublished study of the distribution of bottom-living organisms in relation to the time they spent in the pelagic larval stage It was shown that this time varied with temperature, and that metamorphosis could be postponed by unfavourable conditions There were a relatively large number of papers from the Soviet Union, dealing mainly with the fish, plankton and bottom-living organisms of the Pacific and Antarctic Oceans. Once or twice there was a hint that some of the more special approaches were defending their territories ethology tried to disclaim a paper which showed how a squid kept itself afloat

"The Deep Sea" discussions included the physics and chemistry of circulation, stirring and mixing, the nature and origin of bathypelagic life, the special characteristics of abyssal organisms and the distribution of pelagic-sediment types and nuclear processes in pelagic sediments During discussion of a Soviet study of turbulent diffusion which confirmed some previous work by the late L F Richardson, it was very pleasant to see the charm with which Dr Henry Stommel, probably the only one there who had talked with Richardson, greeted what might be the only mention of his name in the United Nations headquarters with timely reference to his mathematical treatment of foreign politics, arms and insecurity

There was plenty of evidence that new ideas on turbulent processes are being profitably applied to the study of vertical and horizontal movements and to better understanding of internal waves One of the most striking diagrams showed the unexpected complexity of the north and south movements below the Gulf Stream Even more remarkable was one which contoured velocity in a north-to-south vertical section across the sub-surface 'Cromwell' current below the equator in the Pacific Ocean It showed a thin ribbon of water some 100 metres thick and 100 miles wide flowing eastwards at about 2½ knots, mainly between depths of 50 and 200 metres, symmetrical about the equator and known to occur over most of the width of the Pacific Ocean, while all the adjoining water, above, below, north and south, flows in the opposite direction Interpretation of previous climates from the study of the stratigraphy of the deep-sea sediments seems to be one of the most popular oceanic studies, and there was a strong plea for samples of older sediments from depths well below the level attainable by coring Quite shallow bore-holes would give information as valuable as the much discussed deep bore It might be easier to plot previous positions of the equator from the carbonate content of the sediments than to plot previous positions of the poles from evidence of previous magnetism Most of the geologists seem to feel that there ought to be a much greater depth of sediments in the ocean

Discussions on "Boundaries of the Sea" dealt with the effects of land masses and types of coast and sea bottom on the plant and animal populations The rather special conditions in bays and estuaries were emphasized The physical papers dealt with the near-shore circulation One of the most striking papers gave a preliminary survey of the very complex thermal structure in the Straits of Gibraltar obtained with the new towed chain of thermistors Prof W H Munk's morning lecture on the spectrum of sea-level, from ordinary waves to changes in mean sea-level, was one of the most appreciated by the Congress, and the relevant afternoon discussion dealt with a wide range of contributions about effects of pressure, wind, climate and seismic disturbances Further afternoons were devoted to the interchange of energy between sea and air, and to proposed methods for predicting surface conditions and changes in currents There was a very interesting account of observations relating surface slicks to internal waves in a shallow thermocline The internal waves travelled in the same direction as the surface waves and the slicks also moved slowly in the same direction

The section on "Cycles of Organic and Inorganic Substances" included discussions of the chemistry of sea water, the occurrence of biologically active substances, including vitamins and trace elements, primary production, nutrient relationships, balance between living and dead organic matter, exchanges between the sea and sediments and between the sea and atmosphere C E Lucas and J H Steele of Aberdeen and L H N Cooper of Plymouth gave morning lectures There was enough in this section alone to make a conference

One of the most striking features of the Congress was its evidence of the expanding interest of geologists in the ocean Biology, for the first time at such a meeting, probably took second place, and except for the new Soviet expeditions it tended to be concentrated in waters not far from shore The physics of the sea had a good deal to show for the first time, and, not least significant, it could at last be seen to be making observations to check theories

The morning lectures will be published, and everyone attending the Conference had preprints of abstracts of all the papers contributed to the discussions, a very formidable volume of 1,027 pages The simultaneous translations provided by the United Nations staff in English, French and Russian were magnificent We were able to carry on active discussions with Soviet scientists and occasionally listen to them arguing with each other The facilities of the United Nations building for a large assembly with discussion groups are quite extraordinary Most of the 1,200 who registered for the Congress seemed to be staying at the Commodore Hotel only a few blocks away, and there was always someone interesting to talk to The Soviet research ship *Michael Lomonosov*, and five American ships, *Atlantis*, *Chain*, *Crawford*, *Maury* and *Gibbs* were lying at one pier and the French *Calypso* at another There was a good programme of social events including a particularly agreeable visit to the New York Zoological Park

One might penetrate deeper into the science at a smaller meeting, but there could be no better way of getting an impressive though perhaps general idea of the increasing interest and advance in all aspects of the subject For everyone except the organizers it was in fact rather a holiday, and at the same time a most remarkable opportunity for forming new ideas, correcting old ones and thinking what to do next There can be no doubt that some of the work begun there will be continued in growing friendliness by scientists all over the world All marine scientists, and especially those privileged to attend, owe a great debt to Dr Mary Sears and her organizing committee, to all others who helped, and not least to the United Nations

G E R DEACON

DEVELOPMENTS IN THERMODYNAMICS

A SYMPOSIUM on Thermodynamics was held during August 20–25 at Fritzens-Wattens, near Innsbruck, Austria, under the joint sponsorship of the Deutsche Bunsen Gesellschaft fur Physikalische Chemie, and the International Union of Pure and Applied Chemistry, the latter through its Commission on Thermodynamics, the Sub-Commission on Experimental Thermochemistry and the Sub-Commission on Experimental Thermodynamics The symposium was under the general direction of Prof K Schafer (president of the Deutsche Bunsen Gesellschaft fur Physikalische Chemie, and secretary of the Commission on Thermodynamics) with the local arrangements being handled by Prof E Cremer, of the University of Innsbruck Fifty papers were read, and there were 135 participants, representing seventeen countries, including thirty from North America and twenty from Great Britain

Experimental Thermochemistry

The first part of the symposium, under the general heading "Experimental Thermochemistry", contained twenty-three papers Eight of these were studies in bomb-combustion calorimetry The most novel paper of this group, presented by W N Hubbard (Argonne National Laboratory) gave a preliminary account of the successful development of a bomb-calorimeter for combustions in an atmosphere of fluorine gas The bomb is made of nickel, which is rendered inert to attack during the combustion process by a careful pre-fluorination treatment, so that the inner surfaces become coated with a stable nickel fluoride film. Combustion experiments of an exploratory character have been made on twenty-five metals and fifteen inorganic compounds, and three-quarters of these immediately appeared to be suitable for accurate calorimetric study.

Two papers described recent studies using the rotating-bomb calorimeter: in this, the bomb is charged before combustion with a suitable solvent, and rotated after combustion to produce a uniform solution of the combustion products in a definite thermodynamic state. The method has been developed over recent years, and has enabled highly accurate combustion data to be obtained for a variety of organic sulphur-containing compounds. D. W. Scott (Bureau of Mines, Bartlesville) described the further application of the technique to organic fluorides and to some organometallic compounds: results obtained on fifteen organic fluorides were presented, and values reported for the heats of formation of lead tetramethyl, lead tetraethyl, and dimanganese decacarbonyl. The application of the method to organic bromides was described by L. Bjellerup (Lund), and the derived heats of formation critically compared with those independently available from heats of bromination. Comparison of the heats of formation from combustion with those from reaction heats measured by Lacher and his associates at Colorado is satisfactory.

The advantages of polythene ampoules over glass ampoules as containers for liquids in combustion calorimeters were discussed by H. Mackle (Belfast); in the discussion, it transpired that several investigators have experimented with plastic ampoules with considerable success, and that polythene and polyesters are suitable materials to use. Three papers reported new combustion studies by conventional 'static-bomb' procedures. J. D. Cox (National Chemical Laboratory, Teddington) presented results on phenol and the three cresols; M. Colomina (Madrid) gave the results of an investigation of five alkylphenylketones and of the three toluic acids; and J. Tjebbes (Lund) reported on the heats of combustion of butanal and five related compounds. In these studies, the error limits were of the order 0·01–0·02 per cent, which is fairly representative of the degree of precision attainable by modern combustion calorimetric techniques in favourable cases. C. T. Mortimer (Keele) reported heat of combustion data on triphenylphosphine, triphenylphosphine oxide, and triethyl phosphate. These compounds can scarcely be described as 'favourable cases' for combustion study, in view of the difficulty of analysing the products of combustion, so that the error limits of only 0·1 per cent reported by Mortimer are encouragingly small, and suggest that further thermochemical studies on organophosphorus compounds of biochemical importance should be rewarding.

Reaction calorimetry (heats of reactions other than combustion) was represented by three papers. E. J. Prosen (National Bureau of Standards, Washington) gave an account of the extensive studies on the thermochemistry of boron hydrides, including the measurement of the heats of thermal decomposition of the boron hydrides into elements, of their heats of hydrolysis, and heats of chlorination. The heat of formation of boron trichloride from elements has also been measured. Reliable values are now available for the heats of formation of the boron hydrides and of boric acid. Values were derived for the bond-energy terms of various boron bonds, including the tricentric 'bridge bonds' involving boron atoms. The empirical scheme proposed by Prosen was applied to interpret structural features of the more complex hydrides of boron. H. A. Skinner (Manchester) described some thermochemical studies on reactions of diborane, in this case the addition reactions of diborane with olefines to form boron tri-alkyls. These reactions occur rapidly in diglyme solvent at room temperature, and provide a promising route to the heats of formation of the boron tri-alkyls. N. N. Greenwood (Nottingham) described the application of solution calorimetry to the measurement of heats of formation of 1:1 and 1:2 donor–acceptor complexes of gallium trichloride, gallium tribromide, boron trichloride and boron tribromide with various oxygen and nitrogen donors. For a given ligand, the heats of formation of the tribromide complexes are consistently greater than for the corresponding trichlorides, and the heats of reaction of boron trichloride with nitrogen donors are larger than those of gallium trichloride with the same ligands.

Two papers dealt with the thermochemistry of alloys. O. Kubaschewski (National Physical Laboratory, Teddington) reviewed calorimeters suitable for measuring the heat of formation of alloys, with particular reference to calorimeters developed at the National Physical Laboratory for direct measurements on solid alloys formed by heating powdered metal mixtures at high temperatures. A. Schneider (Gottingen) reported directly measured heats of formation of InSb, $MgZn_2$, MgZn and Mg_2Zn_{11}, and indirectly determined free energies of formation of Fe_2Zr, Al_2Zr, Al_3Zr_2 and Al_3Zr_4.

There were three contributions concerned with the heats of mixing of liquids. In one of these, M. L. McGlashan (Reading) emphasized that measurements on heats of mixing should be carried out under conditions in which the vapour phase is entirely eliminated, and described an ingenious calorimeter for this purpose. Heats of mixing of pairs of compounds from the series $Si(CH_3)_{4-n}Cl_n$, and from the series $C(CH_3)_{4-n}Cl_n$ were reported, and discussed in terms of the 'quasi-chemical approximation'. Mixing heats in the binary and ternary systems formed from acetic acid, pyridine and a normal paraffin hydrocarbon (hexane, heptane, etc.) were reported by W. Woycicki (Warsaw). W. Wagner (Dresden) described a series of measurements of activity coefficients, heats of mixing and volumes of mixing of the chlorotoluenes in benzene solvent.

Studies of chemical equilibria were the subject of two papers: in one of these, S. Sunner (Lund) described the use of the gas-phase chromatographic technique to analyse the disproportion reaction MeSSMe + EtSSEt $\rightleftharpoons$ 2MeSSEt, at 25° C and 60° C. A. Pacault (Bordeaux) spoke of a series of equilibrium studies on double decomposition reactions in the solid state between barium sulphate and sodium carbonate and potassium carbonate.

The thermochemistry of tellurium carbonate, tellurium thiocarbonate and barium thiocarbonate, determined from dissociation pressures measured over a temperature range, was described by G. Gattow (Gottingen), and the formation and thermodynamic stability of mixed halides, for example, CuClBr, by R. Perret (Dijon).

I. Wadso (Lund) described a novel adiabatic calorimeter for the direct measurement of heats of vaporization at 25° C. suitable for liquids having a vapour pressure of 5–100 mm. mercury at room temperature. The accuracy achieved was of the order of 0.5 per cent.

The accepted value for the heat of dissociation of nitrogen was questioned by G. Glockler (Durham, N.C.), and L. H. Long (Exeter) raised the interesting problem of the relation between bond dissociation energies and valence-state excitation energies, by specific reference to experimental data available on metal–carbon bonds.

This first part of the symposium was summed up by F. D. Rossini (Pittsburgh) and by J. Coops (Amsterdam). Prof. Rossini, reflecting on thirty years of thermochemistry, recalled the stages in its development. First, to design calorimeters of sufficient accuracy; then to prepare compounds of sufficient purity, and now to extend the range of investigation to substances more difficult to prepare, to purify, and to analyse, requiring full use of all the tools of modern analysis.

Physical Constants

The second part of the symposium, arranged by the Commission on Thermodynamics, contained six papers. The first of these, given by F. D. Rossini (Carnegie Institute, Pittsburgh), concerned the present state of knowledge on the fundamental constants of physical chemistry. Five of these have to be determined by experiment; the others are defined by international agreement. In addition, there are auxiliary constants which derive from the fundamental constants. Since 1951, the ice-point of water has become a defined constant, and improved values have become available for the constants, h, c, e, F and N. In 1960, it is proposed to adopt a new scale of atomic weights based on carbon-12 = 12.0000, which will differ from the present chemical scale by 42 p.p.m., and from the present physical scale by 317 p.p.m.

There were three papers on the thermodynamic scale of temperature, and its realization through the international scale, given by Van Dijk (Leyden), H. Moser (Braunschweig) and C. Tingwaldt (Berlin).

In the range 0–90° K., new measurements have been made on the boiling-points of helium and oxygen, with results which differ by only 1/1,000° and 1/100°, respectively, from the older values of 1937 and 1927. The points 4.215° K. and 90.18° K. (relative to the ice-point = 273.15° K.) representing the boiling-point of helium and oxygen may be regarded as in practically complete agreement with the thermodynamic scale. For n-H_2, the most recent measurements of the boiling-point by various investigations gives the mean value 20.379° K. Secondary fixed points in this region are shown in Table 1.

In the range between the two fixed points of the boiling-point of oxygen (– 182.97° C.) and the boiling-point of sulphur (440.60° C.), which is spanned in the international scale by measurement using the platinum resistance thermometer and the three-term formula, the deviations $\Delta T (= T$ (thermodyn.) $- T$ (internat.)) vary from +0.04° at –80° C. to + 0.13° at 400° C. In the range from the boiling-point of sulphur to the melting-point of gold, in which the international scale relies on the interpolation formula for the e.m.f. of a platinum/platinum–rhodium element, the deviations ΔT reach as high as 1.7° C. It is suggested on the basis of new measurements that the melting-point of gold is 1,064.76° C. in place of 1,063°, as accepted by the international scale. This is a large change to make, and until more evidence is available it is premature to make the change in the international scale.

Table 1. Secondary Fixed Points

Gas	Boiling-point (° K.)	Triple-point (° K.)	λ-point (° K.)
Argon	83.81		
Nitrogen	77.35		
Oxygen		54.34	
p-Hydrogen	20.27	13.81	
n-Hydrogen		13.95	
Helium			2.172

A change in the radiation constant from 1.438 to 1.4388, coupled with an increase of 1.76° C. in the defined melting-point of gold, would eliminate the differences between the international and thermodynamic scales above 1,500° K.

The measurement of temperatures above the gold point by optical pyrometry was discussed by C. Tingwaldt, with particular reference to experimental methods of obtaining ideal black-body radiation from a glowing solid. The lateral radiation from a glowing metal is extensively polarized 'non-black' radiation: by allowing radiation from one source to fall at an angle of 45° on to a glowing metal strip, the combined radiation (reflected and emitted) from the strip is unpolarized, black radiation corresponding to the temperature of the glowing source.

There were two papers describing new designs of calorimeter. One of these, by A. R. Meetham (National Physical Laboratory, Teddington) reported on the design and use of an aneroid bomb-calorimeter made of silver, and vacuum-jacketed, for measuring heats of combustion. The heat transfer coefficient of the calorimeter is very much smaller than that of stirred-water calorimeters. The internal volume is 97 ml., and 0.2 gm. benzoic acid on combustion gave a 3.5 deg. C. temperature rise. The standard deviation of individual estimates of the heat of combustion of benzoic acid was less than 1 part in 5,000.

F. E. Wittig (Munich) described the constructional details and operation of a high-temperature calorimeter for thermal studies on metallic alloys.

Phase Changes in Condensed Systems

The third part of the meeting had as its subject "The Thermodynamics of Phase Changes in Condensed Systems", and was sponsored by the Sub-Commission of Experimental Thermodynamics. Introducing the first session, Prof. D. M. Newitt (Imperial College of Science and Technology, London) said that the object of this meeting, and of its predecessor in London in 1957, was to encourage work to fill the gaps in our knowledge of thermodynamic properties, and especially of those of pure substances.

The majority of the speakers discussed the phase transitions of solids. There were two introductory reviews. The first was by J. E. Mayer (Chicago), who gave a lucid account of the thermodynamics of phase changes in terms of the singularities of the Helmholtz free-energy and emphasized how restricted were the types of transition that could be adequately treated by the present developments of statistical mechanics. The second was by J. P. McCullough (Bureau of Mines, Bartlesville), who outlined an empirical division into seven types of the solid–solid transitions of hydrocarbons and of related substances

A. R. Ubbelohde and his colleagues, Miss E. Rhodes and E. R. Buckle (Imperial College of Science and Technology, London), contributed a group of three papers which discussed the mechanism of melting and freezing. They demonstrated most convincingly that the classical thermodynamic picture of melting as the sharp intersection of two unrelated free-energy curves was inadequate for material composed of complex molecules or ions.

The largest group of papers in this section were detailed studies of particular solid systems. Silver oxide was shown by K. S. Pitzer (Berkeley) to have two anomalous regions in its heat-capacity curve. The first, in the region of 20–40°K., was still without a verified explanation, but the second, 370–470°K., was an annealing of surface and crystal defects. J. G. Aston (Pennsylvania State University) and E. F. Westrum (Michigan) both presented measurements of the heat capacities of systems containing highly symmetrical organic molecules, the *molécules globulaires* of Timmermans. Such systems are of particular interest since the symmetry and 'smoothness' of the molecules allow them to melt with respect to their orientations without disrupting the crystal. This orientation energy and entropy are acquired at one or more transitions below the true melting point. J. E. Spice (Liverpool) reported a detailed study of mixtures of ethylene dichloride and dibromide. The former has long been known to have a broad maximum in its heat-capacity curve at 180° K. On dilution with dibromide the peak moves at first to lower temperatures and becomes less pronounced. The behaviour of the system is, however, complicated by the partial immiscibility of the two solids.

The thermodynamic studies of indane and indene by D. R. Stull (Dow Chemical Co., Michigan) were most notable for the high degree of 'automation' in his calorimeter. This led to many questions regarding the time taken to reach equilibrium in many solid systems.

The magnetic transitions of the divalent salts of manganese, iron, cobalt and nickel were reviewed by J. W. Stout (Chicago). These systems provided unusually elegant examples of the entropy ($R \ln n$) associated with n available electronic states per ion. W. E. Wallace (Pittsburgh) has made a very detailed study by calorimetry and by electrical, magnetic and X-ray examination of the differences between the α and β phases of tantalum hydride and tantalum deuteride. The results were interpreted in terms of differing amounts of short-range and long-range order in the allocation of the hydrogen atoms to the interstitial sites. G. M. Schwab (Munich) reported a study of the α to β phase change in cobalt.

The last group of papers were those that dealt primarily with liquid phases, or in which the interest was in the application of theories of mixtures to the results. R. Heastie (Queen Mary College, London) had studied the phase equilibria of mixtures of krypton with argon and with xenon. The systems were miscible in both solid and liquid phases at the melting-point and the form of the melting curves provided a test for the lattice theories of solution of Prigogine. Unfortunately, true equilibrium in the solid phases was not always achieved. T. M. Storvick and J. M. Smith (North-Western University, Illinois) have studied the thermodynamic properties of mixtures of hydrocarbons and alcohols in liquid and gaseous phases at temperatures up to the gas–liquid critical points. The deviation of their results from those of purely hydrocarbon mixtures was interpreted in terms of the degree and heat of polymerization of the alcohol molecules. J. S. Rowlinson (Manchester) demonstrated that lower critical solution points are not confined to polar mixtures but are commonly found also in binary hydrocarbon mixtures if the size ratio of the constituent molecules is sufficiently large. This behaviour appears to be the rule for high-polymer solutions, almost all of which separate into two phases above the normal boiling-point of the solvent. Finally, R. I. Munn (Vienna) reported a careful re-examination of the phase-boundary curve near the lower critical solution point of the system water + triethylamine. The curve has an unusual, and unexplained, point of inflexion.

Three papers less easy to classify were given by K. S. Pitzer on "Irreversible Thermodynamics", D. White (Columbus, Ohio) on "*o-p* and Isotope Separations by Preferential Adsorption at Low Temperatures", and by G. Watelle-Marion (Dijon) on a spectrophotometric study of the ionization of a divalent–metal salt.

OBITUARY

Prof. F. Kögl

PROF. F. KÖGL died on June 6 at Utrecht after an illness of about two years. From 1930 until his death at the early age of sixty-one, he had been professor of organic chemistry and of biochemistry at the State University of Utrecht.

Fritz Kögl was born on September 19, 1897, at Munich. He studied chemistry under such famous teachers as H. Wieland, H. Fischer and A. Windaus and became well known himself at an early age by his studies of natural pigments produced by certain bacteria and fungi. While a *Privatdozent* at Göttingen, he was called to a professorship at Utrecht in 1930 as the successor of Van Romburgh and of Ruzicka. Here he widened his field of activities enormously. Interest in growth phenomena of plants led to the isolation and characterization of the auxins. He and his co-workers were the first to recognize β-indolylacetic acid as a natural plant-growth hormone. The consequences of this work are well known to all dealing with the theoretical and practical aspects of plant growth. His studies of growth factors for micro-organisms led to the isolation and the partial characterization of biotin.

From normal growth processes Kögl turned his attention around 1939 to the abnormal growth occurring in animal tumours. He developed a daring hypothesis based on a presumed loss of stereospecificity, resulting in the incorporation of D-amino-acids in tumour proteins. Although this theory could not be maintained against experimental evidence, it proved very stimulating for the continued biochemical approach to protein chemistry. During the past ten years many new fields of current biochemical interest were tackled Among these, important studies on diabetes, on membrane chemistry and on thermo-regulation in the warm-blooded animal must be mentioned

It was a great satisfaction to Kogl himself that a problem started before 1930 was solved just before his final illness This was the elucidation of the chemical structure of muscarin, the poisonous constituent of the fly-agaric (*Amanita muscaria* L) The structure of muscarin had puzzled chemists for more than a century, Kogl and his associates concluded this chapter brilliantly by synthesizing the active compound

Kogl was an inspired investigator and teacher More than sixty doctoral theses are a lasting testimony of the School he founded His death is a grievous loss to the University he served for almost thirty years He is survived by his wife and two daughters

G J M VAN DER KERK

NEWS and VIEWS

Royal Society Officers for 1960

AT the anniversary meeting of the Royal Society, Sir Cyril Hinshelwood, Dr Lee's professor of chemistry in the University of Oxford, was re-elected president The other officers re-elected for the ensuing year were Treasurer, Sir William Penney, member for scientific research, United Kingdom Atomic Energy Authority, Biological Secretary, Sir Lindor Brown, Jodrell professor of physiology at University College, London, Physical Secretary, Sir William Hodge, Lowndean professor of astronomy and geometry in the University of Cambridge, and Foreign Secretary, Dr H G Thornton, lately head of the Department of Soil Microbiology at Rothamsted Experimental Station Other members of Council elected were Prof J F Baker, professor of mechanical sciences, University of Cambridge, Dr J C Burkill, University lecturer in mathematics, Cambridge, Prof D G Catcheside, professor of microbiology, University of Birmingham, Prof T M Harris, professor of botany, University of Reading, Prof L Hawkes, emeritus professor of geology, Bedford College, University of London, Prof A L Hodgkin, Royal Society research professor, Sir Patrick Linstead, rector of the Imperial College of Science and Technology, London, Dr R A Lyttleton, reader in theoretical astronomy, University of Cambridge, Prof H S W Massey, Quain professor of physics at University College, University of London, Prof R A Morton, Johnston professor of biochemistry, University of Liverpool, Sir Alfred Pugsley, professor of civil engineering, University of Bristol, Prof R J Pumphrey, Derby professor of zoology, University of Liverpool, Prof H W B Skinner, Lyon Jones professor of physics, University of Liverpool, Prof W Smith, professor of bacteriology at University College Hospital Medical School, University of London, Dr H W Thompson, university reader in infra-red spectroscopy, Oxford, and Prof J Z Young, professor of anatomy at University College, University of London

National Chemical Laboratory

Dr D D Pratt, C B E

AFTER thirty-four years as a member of the staff of the National Chemical Laboratory, Dr D D Pratt retired from the post of director of the Laboratory on September 30, but in order to assist the new director, Dr J S Anderson, he agreed to occupy the vacant post of assistant director for a period of two months Born at Anstruther, Fifeshire, Dr Pratt graduated at St Andrews and received his post-graduate training both there and at Manchester under Prof (now Sir) Robert Robinson This period was interrupted by the First World War, throughout which he served as an officer in the Highland Light Infantry In November 1925, a few weeks after its opening, Dr Pratt joined the Chemical Research Laboratory, being appointed to take charge of research on tars, particularly those from the low-temperature carbonization of coal, this work had several successful applications in industry His ability was soon recognized by Dr G T Morgan, who quickly promoted him until he was the senior officer under the director When Morgan retired in 1938, Pratt was made officer-in-charge of the Laboratory for the six months which elapsed before Dr G S Whitby became director This was the first of several occasions when he was in charge under various titles, until finally he was appointed director in March 1951 His period in this office has been marked by considerable activity and expansion The rapid increase in radiochemical work led to the creation of a separate laboratory for this purpose The Microbiology Group was re-housed in a new building while responsibility was also assumed for the National Collection of Industrial Bacteria Under Dr Pratt's leadership the Laboratory has grown in numbers, in size and in reputation Its name has been changed to the National Chemical Laboratory, there has been some re-organization of the programme, but in spite of growth and change, Dr Pratt succeeded in maintaining the friendly atmosphere which has always characterized the Laboratory A friendly man himself, his numerous friends will join in wishing him many happy years of retirement

Prof J S Anderson, F R S

PROF JOHN STUART ANDERSON, professor of inorganic and physical chemistry in the University of Melbourne, has been appointed director of the National Chemical Laboratory of the Department of Scientific and Industrial Research at Teddington, in succession to Dr D D Pratt Prof Anderson, whose work in Great Britain and in Australia has placed him among the leading workers in the field of inorganic chemistry, is particularly well known for his contributions in the fields of solid-state chemistry and the chemistry of complex salts He was elected a Fellow of the Royal Society in 1953 Prof Anderson was born in London in 1908 He graduated with first-class honours in chemistry at the Imperial College of Science and Technology, London, in 1928 After three years postgraduate research under Prof H B Baker, he went to Heidelberg for one year In 1932 he joined the staff of the Chemistry Department at the Imperial College Six years later Dr Anderson was appointed senior lecturer in chemistry in the University of Melbourne.

During the War he took part in chemical work aimed at developing new natural resources in Australia He returned to Britain in 1947 to join the Chemistry Division at the Atomic Energy Research Establishment, Harwell, but went back again to Australia in 1954 Prof Anderson is joint author with Prof H J Emeléus of "Modern Aspects of Inorganic Chemistry"

Directorship of Colaba and Alibag Observatories

Mr S L. Malurkar

MR S L MALURKAR, who has retired from the directorship of the Colaba and Alibag Observatories, was born in Hassan on August 15, 1903, and educated in government schools and colleges at Bangalore Due to Prof M Venkatrama Iyer's influence, he turned to original studies in mathematics after 1920, in addition to the subjects in physical sciences taken in the Central College at Bangalore His studies included ellipsoidal wave functions, producing many new results These led to a study of non-linear integral equations for a large number of types of functions, and their evaluation in terms of elliptic functions, asymptotically and otherwise At Cambridge (1927–29), while working in the Solar Physics Observatory, he published a classification of arc spectra of antimony and arsenic His stay at Cambridge was initially helped by the Government of Mysore at the instance of Dr E P Metcalfe and the late Sir Mirza M Ismail He joined the India Meteorological Department in 1930, taking over the investigations on radiation, by this means he examined temperature distributions near heated surfaces, in collaboration with Dr L A Ramdas While at Agra (1936–37) he developed a basic theory of balloons for meteorological purposes In 1948 he was put in charge of the Colaba and Alibag Observatories, where he carried out much important work on geomagnetism and cognate phenomena, the magnetogram and the photolysis of atmospheric ozone in the presence of water vapour He was president of the Physics Section of the Indian Science Congress held at Madras in 1958

Royal Society of South Australia Award .

Dr C G. Stephens

THE Verco Medal is the highest award which the Royal Society of South Australia can bestow on scientific workers who have made exceptional contributions in their particular field of interests This year the Medal has been awarded to Dr C G Stephens for his excellent and outstanding work on soils Dr Stephens attended the Launceston High School, following which he attended the University of Tasmania, where in 1929 he graduated, and later gained his master's degree He was awarded a D Sc by the University of Adelaide in 1950 for his work on Australian soils He joined the Commonwealth Scientific and Industrial Research Organization—then known as C S I R —on a postgraduate scholarship in April 1929 and has remained with the Organization since that date. His association with its Tasmanian staff ceased in 1938 when he was transferred to South Australia To-day, he is head of the Soil Survey and Pedology Section, Soils Division, Adelaide The practical applications of Dr Stephens's work have important bearing especially in the relationships of soil to land uses and development, and to soil fertility problems In consequence, he has been asked to give assistance in these matters both within Australia and overseas Dr Stephens was appointed consultant at the Food and Agriculture Organization headquarters in Rome in 1952 During this period he added to his publications with the report, "Soil Survey for Land Development" In 1954 he was appointed president of Commission 5 (Soil Classification) at the International Congress of Soils at Leopoldville, Belgian Congo Dr Stephens is prominent among Fellows of the Royal Society of South Australia and served two periods as vice-president, namely, 1954–55 and 1956–57, and was president during the year 1955–56

Higher Education in East Africa

IN reply to a question in the House of Commons on November 24, the Secretary of State for the Colonies said that work had begun on the new technical institute building in Nairobi with the help of a £65,000 grant from Colonial Development and Welfare Funds The East African Governments had accepted the recommendations of the Working Party on Higher Education in East Africa for a University of East Africa, comprising three inter-territorial university colleges, of which the re-constituted Royal Technical College would be one, and they were now studying the financial and other implications of the recommendations with the view of preparing a phased programme acceptable to all three territories

Petroleum Industry Centenary

THE September issue of *The British Survey*, published by the British Society for International Understanding, is a survey of the petroleum industry from 1859, the year that Edwin Laurentine Drake drilled his historic well at Oil Creek, Titusville, Pennsylvania, U S A , until the present time, the centenary year of the petroleum industry, which to-day is the biggest industry in the world The survey traces the evolution of the industry from its origins, but also stresses the economic aspects as affecting not only peoples of the producing countries but also those who consume rather than produce petroleum and its multitudinous products—now well over a thousand in the domestic field alone, quite apart from the more widely known, major refined products This article is not merely a re-statement of time-worn facts regarding the oil industry and its international ramifications The sections on "Oil Industry as a Citizen", "Cost, Need and Complication", and "Tendencies to State Participation" are refreshingly original and logically sound The survey concludes with a modest forecast of the rate of increase in demand for oil in the next 10–15 years United States, 4–5 per cent per annum , rest of the Free World, 6–7 per cent per annum , Western Europe, 7 per cent per annum So far as can be estimated at present, the crude oil production to the end of 1958 amounted to the staggering figure of nearly 19 million barrels a day

Soviet Scientific Information in the United States

THE National Science Foundation, Office of Science Information Services, has issued a revised edition of a pamphlet, "Providing U S Scientists with Soviet Scientific Information", which presents a concise picture of what is being done to make scientific periodicals, serials and books published in the U S S R readily accessible to scientists in the United States (pp 36 Washington, D C . National Science Foundation, 1959) The magnitude of the problem is displayed in four tables which give a total of 2,026 periodicals and serials and some 55,732 books in 1955. A selected list of bibliographies published in the U.S.S.R. and a list of dealers in Soviet publications in the United States follow, and the arrangements made for translating Russian periodicals, papers, monographs and abstracts are then briefly described. This account is supported by a table listing Russian scientific periodicals available in English and giving the agency, sponsor and subscription. Some details of abstracting services are included, and there is a list of annual publications which contain reviews of Soviet science.

Geodetic Marker at the South Pole

During the 1960 season of the U.S. Antarctic Research Programme the Coast and Geodetic Survey of the U.S. Department of Commerce will erect a marker permanently identifying a geodetic position near the South Pole. The 3-in. bronze disk to be erected inside a building will indicate the exact location of the South Pole Station of the U.S. Antarctic Research Programme at lat. 89° 59′ 43·6″ S. and long. 24·8′ W. At this spot the scientific leader, Major Palle Mogensen, made 52 independent sets of astronomical observations during the antarctic night. Data resulting from these observations were brought back to the United States by Major Mogensen and passed on to the Coast and Geodetic Survey for computation of the exact position of his observing station. Scientists of the Bureau have determined that the South Geographical Pole lies approximately 1,650 ft. south of Major Mogensen's station.

Vegetation on Mars

It has often been suggested that the dark areas of Mars consist partly of vegetation, particularly in view of the seasonal variation of the intensity of the dark regions. Tests for the high near-infra-red reflectivity characteristic of many plants have all given negative results. A few terrestrial plants, such as some lichens, do not show this characteristic, and possibly such plants are present on Mars. W. M. Sinton (*Astrophys. J.*, 126, 231; 1957. *Lowell Obs. Bulletin*, No. 103; 1959) has suggested and twice carried out a new test for the presence of vegetation. All organic molecules possess strong absorption bands at wave-lengths near 3·4μ, the wave-length of the carbon–hydrogen bond resonance; the precise wave-length depends on the individual molecule. These bands have been studied by Sinton as they appear in the spectra of a number of terrestrial plants, including lichens and mosses. In all the plants tested, the carbon–hydrogen resonance bands appeared to some extent. Tests were carried out on Mars at the oppositions of 1956 and 1958. Relatively little light is received from Mars at a wave-length of 3·4μ, so that very sensitive equipment was needed to render the work possible. A lead sulphide cell cooled in liquid nitrogen was chosen as the detector and preceded by a monochromator equipped with a lithium fluoride prism. The 1956 tests were made at Harvard and the 1958 tests at the 200-in. telescope at Mount Palomar. The radiation received from Mars was analysed theoretically into thermal radiation and reflected solar radiation. The latter shows three absorption bands at 3·43μ, 3·56μ and 3·67μ. These appear to be peculiar to the dark regions of Mars. The bands are weak or absent in the bright regions, and are therefore formed neither in the atmosphere nor in the bright regions of Mars. No other new absorptions were found. Although one cannot be certain that no inorganic molecule can explain these absorption bands, the observed spectrum does fit very closely that of organic compounds and plants. The first two bands are easily observed in plants; that at 3·67μ seemed at first to be an enigma. However, it has now been found in the alga *Cladophora* and appears to be produced by carbohydrate molecules in the plant. Sinton's results are the best evidence yet produced for the existence of vegetation on Mars.

A New Fossil Penguin from Australia

A specimen of part of a fossil penguin named *Anthropodytes gilli* sp. nov., found by E. D. Gill in 1950 in western Victoria, Australia, has been described by G. G. Simpson (*Proc. Roy. Soc. Victoria*, 71, 113; 1959). The actual find (now housed in the National Museum of Victoria) consists of the right humerus, nearly complete, but lacking most of the head. *Anthropodytes* does not show any unmistakable signs of special affinity with any previously named genus, but of the fourteen known genera of fossil penguins in which the humerus is known the closest resemblance is to *Archæospheniscus* from New Zealand. Although *Anthropodytes* was not found *in situ*, evidence relating to attached fossils, situation, and the fluorine test presented by E. D. Gill (p. 121, *loc. cit.*) strongly suggest that the specimen came from an adjacent marine Miocene formation.

Molluscan Fauna of the Netherlands

The Netherlands Malacological Society, Amsterdam, has this year celebrated its twenty-fifth anniversary, and to commemorate the event the Society has published a special supplement to its journal (*Basteria*, Vol. 23) devoted to the Netherlands as an environment for molluscan life. The book contains seven chapters, all in English, with summaries in Dutch. The opening section deals with the history of the study of the Dutch recent Mollusca and this is followed by accounts of the general ecology of the marine, brackish-water, fresh-water and terrestrial mollusc fauna in the Netherlands. Two other chapters are concerned with the nudibranch molluscs and with the dead shells which are found washed up on the beaches. The authors who have contributed to this volume are all well-known authorities on their subjects and the result of their efforts makes good reading not only for those specifically interested in the Mollusca but also for all zoologists who are interested in ecology.

The Agricultural Institute of Ireland

The Council of An Foras Talúntais (The Agricultural Institute), as part of its educational activity in the promotion and encouragement of agricultural research, announces the award of junior postgraduate agricultural research scholarships for the academic year 1959–60 to the following candidates, who will undertake postgraduate studies in the University departments listed: Mr. James Coyle (University College, Dublin), at the Department of Chemistry at the University of Leeds; Mr. Julian Hart (University College, Cork), at the Department of Statistics, University College, Cork; Mr. James Kavanagh (University College, Dublin), at the Department of Botany, University College, Dublin; Mr. Ronan F. Lambe (University College, Galway), at the Department of Chemistry, University College, Galway; Mr. John L'Estrange (University College, Dublin), at the

Department of Agricultural Chemistry, School of Agriculture, University College of North Wales , Mr Brian T Little (University College, Dublin), at the Department of Industrial Microbiology, University College, Dublin , Mr Cornelius Long (University College, Dublin), at the Department of Experimental Physics, University College, Dublin , Mr Vivian Timon (University College, Dublin), at the School of Agriculture, Newcastle upon Tyne (University of Durham)

Ciba Fellowships

Several Ciba Fellowships will be awarded for tenure during the academic year 1960–61 at Continental universities or institutions for research in chemistry, physics or some other allied scientific subject They will be awarded to graduates of universities of the British Isles The basic award for Fellows who wish to continue postdoctorate studies will be £800 per annum plus allowances For candidates who have obtained a first degree in science and wish to undergo training in research, the basic award will be £500 per annum plus allowances The total value of each fellowship will be determined by the advisory panel, and will be sufficient to cover the Fellow's living and other expenses (including fees and cost of travel) during the tenure of his fellowship, which will be for one year, renewable for a further one or two years Six Fellowships were awarded last year for tenure in 1959–60, and Ciba Fellows are at present working at Zurich, Gottingen, Louvain, Heidelberg and Copenhagen Applications should be made in duplicate on forms obtainable from the Secretary to the Ciba Fellowship Trust, Ciba (A R L), Ltd , Duxford, Cambridge The closing date for such applications is January 31, 1960

University News

Belfast

The appointment of Dr F J Wallace (Birmingham) to senior lecturer in mechanical engineering is announced, also L J Clein (Maudsley Hospital, London) to be lecturer in mental health

Bristol

The following appointments are announced Dr J W Barton (Bristol), lecturer in organic chemistry , Dr D L Dineley (Birmingham), lecturer in geology , Dr K R Gough (Bristol), research fellow in medicine , Dr S Griew (London), lecturer in psychology , Dr M A Hollingsworth (London), lecturer in mechanical engineering , B S Smith (Manchester), lecturer in civil engineering , D J Storey (Cambridge), lecturer in electrical engineering , Dr C J Waddington (Bristol), lecturer in physics

The Department of Scientific and Industrial Reseach has made grants as follow to the Department of Physics, £16,680 for research under the direction of Prof C F Powell for experiments in cosmic radiation with balloons photon-induced cascades at different altitudes, and time variations in the primary cosmic radiation over Great Britain , £35,084 to the Department of Psychology, for research into the complexity of industrial tasks , to the Department of Geology, £5,000 for investigations of feldspars in the Connemara granite series and preferred orientation in rock-forming minerals , and £3,550 for investigations of the submarine geology of the continental shelf of the Western Approaches of the English Channel by Prof F Whittard , £3,850 to the Department of Physical and Inorganic Chemistry for equipment , and £2,880 to the Department of Zoology for investigations of the physiological basis of behaviour in protozoa The National Coal Board has made a grant of £1,150 to the Department of Physical and Inorganic Chemistry for a study of carbon surfaces and surface complexes by infra-red spectroscopy, and £1,100 for a study of reactivity of carbon surfaces with oxygen A grant not exceeding £1,150 has been made by the Ministry of Supply to the Department of Electrical Engineering for research on noise generation in inductors with ferromagnetic cores (continuation of grant)

London

Dr. P B D de la Mare (New Zealand), reader in chemistry at University College, has been appointed to the University chair of chemistry tenable at Bedford College from October 1, 1960 The title of professor of experimental physics in the University of London has been conferred on Dr F C Champion (Cambridge), in respect of his post at King's College The following readerships are announced Dr D R Arthur (Wales), in zoology, in respect of his post at King's College , Dr J B Hasted (Oxford), in physics, in respect of his post at University College

Announcements

The Physical Society has announced a conference on "Electron–Phonon Interaction in Solids", to be held in the Townsend Lecture Theatre, Clarendon Laboratory, Oxford, during December 17–18 Further information can be obtained from Miss E Miles, Physical Society, 1 Lowther Gardens, Prince Consort Road, London, S W 7

The Royal Institution has announced the one hundred and thirtieth course of six Christmas lectures adapted to a juvenile auditory The lectures, entitled "The Release and Use of Atomic Energy", will be given by Dr T E Allibone on December 29 and 31, 1959, and January 2, 5, 7 and 9, 1960 Further information can be obtained from the Royal Institution, 21 Albemarle Street, London, W 1

The Home Universities Conference, 1959, will be held in the Senate House of the University of London during December 11 and 12 The topics for discussion are "University Co-operation in the Commonwealth", "University Libraries", and "Administrative Problems in Expanding Universities"

The Institution of Mechanical Engineers is arranging an informal discussion on the Computer in Production, to be held on March 21 and 22 The purpose of the meeting is twofold to introduce chartered mechanical engineers and managers to the latest techniques involving the application of computers in production , and to provide a forum for managers engineers and users to present their views to manufacturers of computers Visits to computer centres and to installations where computers are being used on production problems will be arranged Further particulars can be obtained from the Secretary, Institution of Mechanical Engineers, 1 Birdcage Walk, London, S W 1

Errata Prof Daniel I Arnon has pointed out the following mistakes which were overlooked in proof-reading in his article entitled "Conversion of Light into Chemical Energy in Photosynthesis" in *Nature* of July 4, p 10 p 11, col 2, last word in the first paragraph should read "phosphoglycerate . p 11, equation 3, right-hand side, should be "4 Fe^{2+} ', p 17 col 1, equation 7 left-hand side, should be " $2(Chlp)^{+}$ "

INSTITUTE OF PERSONNEL MANAGEMENT

WITH an attendance of some eight hundred members representing central and local government departments, industrial organizations, universities and other educational institutions from Britain and overseas, the annual conference of the Institute of Personnel Management took place at Harrogate during October 9–11 The theme was personnel management and technological change , and the conference was opened by C H Broadhead, a director of the Imperial Tobacco Co , Ltd , who carried out a wide-ranging survey of the growth, development and possible extension of personnel management in British industry In this review, Broadhead emphasized the continuing need for recognizing the employee as an individual in his own right, and for the specialist personnel managers constantly to act so that general management never forgets its personnel function when there is the risk of subordinating the individual to the organization

Then followed five sectional meetings during one of which comparisons were made between the progress of technological education in the United States, the U S S R and Great Britain From his investigations Dr G Tolley, research manager of Allied Iron Founders, Ltd , suggested that there is every indication that the demand for trained engineers in Russia is now being satisfied by numbers currently graduating from full-time courses , it is probable that attention will now be concentrated upon the fulfilment of other objectives, for example, education in special technologies, such as in the chemical process industries In addition, the existing facilities for training technicians and skilled workers, already organized on a vast scale, may be increased and supplemented Although a great deal is known about the content of scientific and technological courses given in Russian educational institutions, little is known about Russian education for management and labour relations, and the key to the development of Russian society may lie here, rather than in the growth of science or technology as such "Already, however, a largely Victorian society is rumbling rapidly on the move, and we would do well to remember that the huge reservoir of highly educated persons now being created in Russia will probably be capable of demanding something more than heavy industry "

At another meeting Miss J Woodward and T Lupton, of the University of Manchester, discussed the contribution of industrial sociology to management education In the development of management theory Miss Woodward indicated that the early period was dominated by pioneers who sought to establish management theory on scientific foundations and to formulate laws which would describe phenomena and explain the relationship between cause and effect in an industrial situation Classical management theory is based on the philosophy of the one best way, and is deterministic in that it assumes that this one best way can be found by suitable study and research In the past twenty years a move away from determinism has taken place It is now generally accepted that similar administrative expedients can, and often do, produce considerable variations in results In the narrower field of the planning and control of manufacturing operations, tools of operational research are being used to isolate the variables linked with these variations In the wider field of administrative behaviour, the move away from determinism has had less satisfactory results There is a tendency to fall back on phraseology and proverbs and to assume that all variations are dependent solely on personality differences The essential step in the establishment of a scientifically valid theory of management is the isolation and understanding of the variables in industrial situations The most important facet of the investigations made by Miss Woodward in south-east Essex was not its challenge to classical management theory but its attempt to isolate one major variable in industrial situations from that of the actual techniques of production and to link this variable with observed variations in results The information collected suggested that the techniques of a particular system of production impose demands on the human beings involved which limit and control their behaviour

Studies of the behaviour of workers by Lupton and his colleagues have led to conclusions similar to those reached by Woodward in her studies of management. The behaviour of workers is influenced by such factors as the productive methods employed, the related administrative structures of the firm, and market factors In the past five years six detailed investigations of the behaviour of workers, using participant observation as the main research technique, have been carried out In only one of these, carried out among male engineering workers, was there behaviour resembling that found in the Bank Wiring Room of the Hawthorne experiments, that is to say, group controls over the level of output and earnings In some workshops evidence was found of individualism and competitive striving as the normal mode of behaviour, while in others there was an absence of a clearly defined code of conduct relating to output and earnings Further research, taking fuller account of other factors, may lead to a situational theory of workers' behaviour which challenges many of the naive sociological and psychological generalizations which pass as 'principles of human relations'

In a discussion on government policy and company pension schemes for manual workers, V R Jackson, head of the Pensions Department, Unilever, Ltd , argued that employers would be unwise to 'contract out' of the graduated part of the State scheme which comes into force in April 1961 Against this, H A R Barnett, a consulting actuary, provided many reasons why employers should seize the opportunity to contract out

The effect of equal pay on employment policies was examined by R E Griffiths, secretary to the Local Authorities' Conditions of Service Advisory Board During the past five years equal pay has been introduced in the public services—including the Civil Service, the Local Government Service (including teachers), the nationalized industries, and the Health Service Progress to man's rate of pay is, by instalments, to be completed in 1961

From observations of the workings of equal pay, Jackson has concluded that, where there is freedom of choice, equal pay will encourage the appointment and promotion of men in preference to women, equal pay may mean less security for women in times of recession, where women form a substantial proportion of an employed group, as in the basic teaching grade, equal pay-rates will tend to be lower than for a solely male group, and scales may be longer This will tend to drive men out of the group, the increase in the inequity of living standards between family men and single women without dependants receiving equal pay will probably necessitate some form of additional family allowances, and, finally, equal pay raises costs, and may force reductions in the numbers employed

The concluding session was concerned with the interaction of operational research and personnel management The organization and mode of working of an operational research department was described by Stafford Beer, head of the Department of Operational Research and Cybernetics, United Steel Companies, Ltd

Operational research involves the application of the methods of science to operations, whether military, industrial economic, or of any other kind It has to consider systems of men and machines, materials and money, it is concerned with the regulation of these systems, with their decision processes, with their operation for maximum profit or minimum wastage or optimum use of resources Operational research deals with the strategy of operations not from general concepts of what management 'ought' to be like, but from the scientific principles of quantification, of inference, of experimental and analytical technique

Beer suggested that operational research was relevant to personnel management for three reasons First, the task of managing operational research itself has been little considered by those responsible for personnel management Most big companies in most industries employ operational research workers These departments have to be organized, and their organization poses very difficult and unusual problems The departments have to be fitted into the existing organization of the parent company or institution on a routine basis, and this also raises difficult issues The growth of this activity has been rapid it has led to an extremely intractable education and training problem in which few educationists have taken an interest Staff are still particularly hard to find, and their suitability hard to assess By informing themselves about the topic of operational research, about its capabilities, its organization and its staff, personnel managers would put themselves in a position to help both their companies and the operational research movement to achieve a properly organized and integrated activity

Secondly, an operational research discussion of its own organization is of possible interest to personnel managers in another way Organization is itself a typical subject of operational research study In discussing the organization appropriate for operational research, points of interest for other kinds of organization may well be uncovered The third point of relevance for personnel managers is the most important Operational research can certainly be applied to personnel problems themselves Personnel management could well commission studies in its own field of problems, when operational research would be found capable of handling systems of exclusively human components. A good demonstration of it in practice was given by L T Wilkins and Herbert Mannheim in their scientific attack on operational problems of the Borstal system This has been hailed as the greatest advance in penology for twenty-five years

The application of operational research to the understanding of human beings was considered by Prof R W Revans, of the Department of Industrial Administration, University of Manchester The human problems of industry are not so much with individuals as with groups There might be profit in trying to understand the nature of authority, the ways it is exercised and the effects that it produces The highly complex relationships perceived as authority, namely, the willingness of one man to do what another man wants him to do, may change their nature simply by being discussed To that extent these problems do not have the objectivity that is often regarded as a necessary attribute of scientific material There is no evidence, for example, to suggest that if one hundred men sit down and talk about the law of gravity for a week, the nature of the law is in any way changed But if one hundred men sit down and talk for a week about a strike in a motor factory, it is likely to make the strike very much worse There is a difference between the study of the social problems of industry and the study of the problems of classical science, but it does not deny the validity of observational methods in the study of society

A particular study of authority arises out of some work that Revans and his colleagues were invited to do at hospitals in the region of Manchester The immediate and urgent problem was—and still is—that there are nothing like enough nurses in our hospitals and there seems little promise of obtaining substantially more

An Indian student spent two years laboriously tracing the records of more than four thousand hospital employees in five comparable hospitals in Lancashire, and in 1958 brought out the first conclusions Srivastava showed that, first, the voluntary wastage of nursing students during their three years of training differed significantly from one hospital to another and that, secondly, the hospitals with high voluntary wastage-rates among students had high wastage-rates among other members of staff, such as cleaners, auxiliary nurses, ward sisters and even the matrons themselves All popular explanations, such as early marriage, the attractions of better paid jobs in the same town, even the decay of modern youth to-day, were shown to be illusory There appears to be about every hospital some factor of cohesion which determines whether anybody in its service will want to stay there or not, and this cohesion (or lack of it) extends up to the matron and down to the most junior nurses

It appeared that this factor of cohesion might have other manifestations If the staff were prepared to stay at one hospital twice as long on average as at another, one might expect this to be reflected in some effect upon the patients Srivastava found that the order in which the hospitals were placed for their ability to retain their student nurses was precisely the same as the order in which they were placed for the 'length of patient stay' Srivastava chose cases which were, between hospitals, most directly comparable For this he chose cases of appendicitis During the year 1958, considerably more than a thousand people were operated upon for this complaint in five hospitals, a perfect fit was found between the percentage of student wastage and the average length of patient stay Average wastage ranged from 38 per cent in the hospital best able to retain its students to 65 per cent in the worst, the mean length of stay for appendicitis ranged from 7 5 days to 11 9 A significant concordance between all staff wastage and all clinical conditions examined was also found Altogether, more than 5,000 cases of appendicitis, hernia, colectomy, partial gastrectomy, cystoscopy, asthma, bronchitis and pneumonia and head injuries have been examined, making allowance for differences between hospitals that have convalescent homes and those that have not, the hospital that can keep its staff longer can also deal with its patients more quickly

This new law reinforces confidence in the organic concept of the hospital, it suggests that staff and patients seem to be influenced to the same extent The source of this influence must be sought in the wards themselves It has already been found that, in the hospitals with the high wastage rates, the student nurses particularly, but other nursing staff as well, complain of a general uncertainty about their work, their instructions often appear to be haphazard and it seems difficult to get decisions out of their committees "A student nurse of 19 may not be afraid of hard work, does not complain about her money or the plainness of her diet, but is terrified of being put into situations which she does not understand because they have not been explained" A feeling of helpless ignorance is more corrosive of morale than the fear of any official rebuke which such ignorance may bring down The girl who becomes a nurse has enough concern for her work to fortify her against the terrors of authority as such But if she feels that she cannot carry her responsibility to her patients because she does not know what to do, she will in the end withdraw from an impossible situation, very often with regret

Revans also drew upon later investigations to examine whether or not the character of the individual hospital is tied up with resistances to the friendly exchange of views and arrival at decisions He suggested that this inquiry into the nature of authority will lead to new fields of inquiry and understanding

ALKALI ION DETERMINATIONS BY MEANS OF GLASS ELECTRODES

THE possibility of measuring alkali ion concentrations in aqueous solutions by means of an electrode potential offers many advantages over other physical methods such as the flame photometer Since the publication in 1957 by Eisenman, Rudin and Casby[1] on the sensitivity to sodium and potassium ions of glass electrodes made from sodium alumino-silicate glasses, interest in the subject has been growing rapidly and a Research Colloquium was held in the Department of Glass Technology, University of Sheffield, on May 6 to discuss the theory of the electrodes and some possible fields of application

Dr G Mattock (Electronic Instruments, Ltd) reminded those present that the development of glasses responsive to alkali metal ions has always been a possibility from the early recognition in studies on *p*H of glasses showing 'alkaline error' In broad terms, the first requirement is to develop a glass which has a large alkali metal ion error There seems to be no fundamental difference between glasses functioning for *p*H and those for alkali metal ions all electrode glasses show some sensitivity both to hydrogen and to alkali metal ions, even, apparently, to other singly charged cations such as ammonium The chief problem in devising compositions is the achievement of selectivity to a given ion in the presence of others

Lengyel and Blum[2], Nikolskii and his co-workers[3], and Eisenman, Rudin and Casby[1] have all shown the importance of aluminium and/or boron in promoting alkali metal response when substituted for silica in a glass The last-named workers have carried out a very exhaustive study on the $Na_2O - Al_2O_3 - SiO_2$ ternary system and have worked out extensive theories to cover the whole field of specific interactions at surfaces[4] The fundamental importance of ion-exchange is accepted, the theory considering the factors affecting electrostatic attraction between ions in solution and the glass surface The relative selectivity of glass response to different cations is qualitatively accounted for in terms of the competing effects of negative fields due to residual charges on oxygen ions (caused by the isomorphic introduction of trivalent aluminium or boron into the tetravalent silicon framework) and the hydrating tendencies of the bare cations At low negative field-strengths on the lattice the ability to dehydrate a cation is weak, so that the order of selectivity (considered to depend on the effective radii of the ions) is related to the order of size of hydrated radii At high field-strengths, this order can be reversed, and with intermediate fields, intermediate orders can be obtained—but significantly only eleven are theoretically predictable and only eleven have been found These orders are

(1) Cs, Rb, K, Na, Li
(2) Rb, Cs, K, Na, Li
(3) Rb, K, Cs, Na, Li
(4) K, Rb, Cs, Na, Li
(5) K, Rb, Na, Cs, Li
(6) K, Rb, Na, Li, Cs
(7) K, Na, Rb, Li, Cs
(8) Na, K, Rb, Li, Cs
(9) Na, K, Li, Rb, Cs
(10) Na, Li, K, Rb, Cs
(11) Li, Na, K, Rb, Cs

Eisenman and Rudin are shortly to publish a full description of their treatment

Dr Matlock had been principally concerned up to now with studying the inductive effects of different polarizing substituents on the selectivity properties of glasses, and with obtaining easily workable glasses, a disadvantage of the original compositions of Eisenman, Rudin and Casby having been their extremely high softening points, making them difficult to fabricate into electrodes Collaboration with Dr Eisenman has now enabled development to be made on the basis of the Eisenman and Rudin theory, giving both ease of workability and improved selectivity Glasses responsive to potassium have also been made There seems to be a wide field of application in chemical analysis, in salinity measurements on waters and soils and in various industrial fields, as well as in biochemical and medical spheres

Dr W Bartley, Mr A Renshaw and Miss B M Notton (Cell Metabolism Research Unit, University of Oxford) described tests carried out on experimental electrodes of aluminosilicate glasses prepared in the Department of Glass Technology, Sheffield Sodium aluminosilicate glasses similar to those recommended by Eisenman for sodium ion measurements were compared with sodium alumino-borosilicate glasses, in which some alumina and/or silica had been replaced by boric oxide in order to improve the technological properties

Electrodes were filled with an acetate buffer (0 15 *M* sodium acetate + 0 1 *M* hydrochloric acid *p*H 4 8) in which dipped a silver – silver chloride electrode The reference electrode was of the Beckmann 'fibre' type, the potentials were read on a 'Vibron' electrometer (Electronic Instruments, Ltd) and recorded on a 'Record' pen recorder The potentials were measured of solutions of sodium, potassium and lithium ions and hydrochloric acid ranging from *M* to 10^{-5} *M* and of mixtures of sodium and potassium ions in the same range All solutions except hydrochloric acid were buffered to *p*H 10 by the addition of *tris*(hydroxymethyl)aminomethane The test solutions were left in contact with the electrode until a stable voltage was recorded and the time taken for this to occur was noted

In Table 1 the rates of change of voltage with concentration are given for each of the four cations with each glass In general, the slopes with sodium ions were similar to those with hydrogen ions, ranging between 50 and 60 mV for each tenfold change of concentration The slopes with potassium and lithium ions were some half to three-quarters of that with sodium and varied considerably with glass composition It can be seen that the introduction of boric oxide has caused no systematic change in the alkali ion sensitivities of the sodium aluminosilicate glasses

Table 2 shows the voltages developed in molar solutions of the ions The values for *M* H^+ and *M* Na^+ are considerably higher than the values for *M* K^+ and *M* Li^+ Again it is difficult to observe a consistent trend on the introduction of boric oxide.

* Molecular per cent of sodium monoxide and alumina respectively

† Molecular ratios of sodium monoxide/alumina/boron trioxide/silica Thus it may be noted that sodium aluminosilicate 12 5/12 5 is equivalent to sodium alumino-borosilicate 1/1/0/6

The behaviour of the electrodes was investigated under the important practical conditions occurring when two alkali ion species were present simultaneously It was anticipated that potassium, for example, would interfere with the sodium response of the electrodes when the voltages produced by the two ions separately were about the same Thus *M* potassium chloride would be expected to interfere with all solutions of sodium chloride below 0 001 *M* In the sodium aluminosilicate series of glasses this was true, but in the sodium alumino-borosilicate series interference of the potassium ion already occurred at 0 1 *M* sodium chloride In general, it was not found possible to predict the response of an electrode to a solution containing two ion species, on the evidence of its response to each separate ion Thus the introduction of boric oxide into the sodium aluminosilicate glasses caused a great deterioration of specificity not revealed by the data of Tables 1 and 2

The time taken for the electrodes to register a stable voltage was also measured It varied with the composition of the glass and also with the composition of the ion mixture , but, in general, it was increased by the introduction of boric oxide Thus, the sodium aluminosilicate glasses reached equilibrium in a matter of a few minutes while the sodium alumino-borosilicate glasses took some hours to reach equilibrium All electrodes responded fastest at *p*Na 1 and most slowly at *p*Na 2 or 3 In the presence of potassium ions the equilibration time was increased but the electrodes still reached equilibration fastest at *p*Na 1 and slowest at *p*Na 2 or 3

Of the glasses tested the most useful and least subject to various interferences were the sodium aluminosilicate series ; of these sodium aluminosilicate 11–18 was the best Measurements were made of the sodium content of standard solutions of various sodium salts with a sodium aluminosilicate 11–18 electrode calibrated against sodium chloride With this system, although the measured and standard solutions usually agreed to within 10 per cent, divergencies of up to 40 per cent could occur However, differences of less than 1 per cent in the sodium content of two solutions of a given salt could be detected easily by the use of the electrodes, although the precise concentrations of either solution could not be measured accurately

It was concluded that the electrodes used could not be relied upon for accurate measurements, but were capable of giving a sensitive indication of changes in ion concentrations

Dr J S Stanley (J A Radley's Industrial Research and Development Laboratories, Reading) described the application of glass electrodes responsive to sodium to the study of micelle formation in solutions of paraffin chain salts and dyestuffs Aggregation is easy to detect from the fall in the activity coefficient of the sodium ion, which occurs above the critical micelle concentration The critical micelle concentrations of sodium laurate, sodium lauryl sulphate and dioctyl sodium sulphosuccinate determined by this method agreed well with previous determinations by other methods, and aggregation in several dyestuff solutions has been detected.

The method is particularly useful for determining the association of the counter ion with the micelle, since the electrode determines sodium ion activities directly Dr Stanley said that, so far as he could

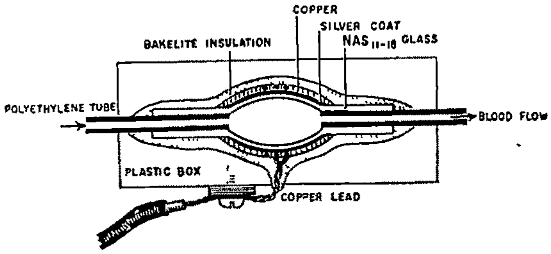

Fig 1 Diagrammatic section through a tubular type of glass-to-silver sodium electrode Measurements are approximately 0 5 cm × 2 0 cm

ascertain, this was the first time that glass electrodes responsive to sodium had been applied to problems outside the biochemical field

Dr J A M Hinke (American Life Insurance Medical Research Fellow, Department of Biophysics, University College, London) discussed the application of glass electrodes responsive to alkali ions in experimental biology and medicine He reviewed the design and performance of a tubular type sodium electrode for measuring plasma sodium of an anæsthetized animal (Fig 1)[5] A thin bulb was blown in the middle of a tube of Eisenman sodium aluminosilicate 11–18 glass and electrical contact was made to the outer surface by a coating of silver Potential changes were amplified with a Cary vibrating reed electrometer and recorded on a Grass model 5 polygraph The electrometer provided enough gain to detect changes of 1 milliequivalents sodium/litre in a total of 140 milliequivalents/litre Such performance indicates two possible advantages of these electrodes over the alternative method of flame photometry for alkali ion determinations, namely, the detection of less than 1 per cent change in sodium concentration and the possibility of continuous recording

Evidence was presented that changes in the flow-rate influence the response of the tubular electrode, but it was shown that this limitation can be minimized by a suitable design of the electrode shape

A second application of glass electrodes has been made on a micro scale (see *Nature*, October 17, p 1257), the glass for which was supplied by Friedman (University of British Columbia) and behaved similarly to Eisenman's sodium aluminosilicate 11–18 and 27–8 glass Table 3 indicates the performance of a microelectrode sensitive to sodium over the physiological molar concentration range of sodium and potassium at *p*H 8 12 Other experiments were cited which indicated that hydrogen ion interfered significantly below *p*H 6 5 but that affects of *p*H could be ignored between *p*H 7 and 8 Over this biological range of sodium, potassium and hydrogen ions, the electrodes behave according to Eisenman's modified empirical formula[6]

$$E = E^0 + \frac{RT}{F} \ln(a_{\text{Na}} + k_{\text{NaK}} a_{\text{K}})$$

where E is measured electromotive force, E^0 is standard potential, a_{Na} and a_{K} are activities of sodium and potassium ions respectively and k_{NaK} is empirical constant for a given glass composition

[Na⁺] 0 16	+ 3 5	+ 3 5	+ 3 5	+ 3 5	+ 3 0

Given standardized sodium and potassium selective electrodes, the potential of each can be measured in an electrolyte system and the equation can be solved for A_{Na} and A_{K} simultaneously This has been done inside muscle cells of crab and lobster using the microelectrodes as already described in *Nature* (*loc cit*)

The discussion which followed emphasized the practical advantages of determining alkali ions by electrodes rather than by flame photometry, these electrodes can give greater sensitivity, they can be used non-destructively with continuous recording and they give a direct determination of activities, instead of total concentration, which may be of great importance in biological or colloidal systems The theory of action of the electrodes was discussed at some length and the need for a fuller investigation of the effects of varying the glass composition was emphasized

POLARIZATION OF LIGHT FROM NOCTILUCENT CLOUDS

By GEORG WITT

Institute of Meteorology, University of Stockholm

MEASUREMENTS of the polarization of light from noctilucent clouds have recently been made in Sweden A commercial 35-mm stereo-camera body was fitted with a pair of *f*/1 65, 50 mm Petzval projection lenses Rotatable 'Polaroid' filters, geared to remain mutually perpendicular, were mounted in front of the lenses Sliding Wratten gelatine filters were used to select the desired range of wave-lengths The image sizes were 22 mm × 22 mm, 1 mm corresponding to approximately 1° in the field of view

This equipment was set up for operation at Torsta (lat 63 3° N, long 14 6° E) during July and August 1958 The station has been used for noctilucent cloud observations since 1955 (see refs 1 and 2) A brilliant display, in good visibility conditions, occurred on August 10–11, 1958, and a sequence of polarization measurements was carried out as follows

The camera was directed at a bright feature in the cloud system Knowing the position of the Sun, the 'Polaroid' filters were orientated to be parallel and perpendicular to the plane containing the Sun, the cloud, and the observer Two exposures were made in quick succession with two different colour filters, the first centred on 4900 A , the second on 6100 A (effective centres on the emulsion used) Exposures varied from 5 to 60 sec on Kodak Plus-*X* emulsion The procedure was repeated for different cloud features covering as wide a range as possible in solar elongation Neutral step-density filters were photographed on the same emulsion, and developed with the cloud records, to provide calibration for subsequent analysis by photodensitometry Neutral step-density filters were photographed on the same emulsion, and developed with the cloud records, to provide calibration for subsequent analysis by photodensitometry The brightness of the features used was at least four times greater than that of surrounding minima, which must include the twilight foreground light Thus no correction for this component was considered necessary

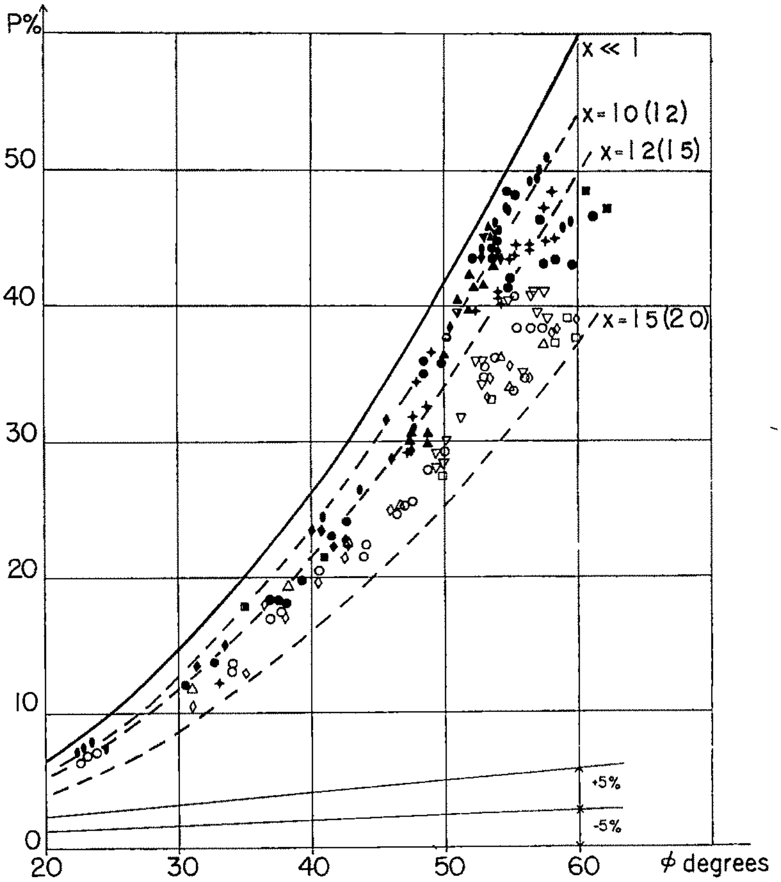

Fig 1 Degree of polarization as a function of scattering angle Open symbols refer to the blue wave-length (λ = 4900 A), and filled symbols to the red (λ = 6100 A) The magnitude of an allowed scatter of 5 per cent is shown by straight lines at the bottom

The interpretation of these results is based upon the Mie theory of scattering of light by small particles (see Van de Hulst[3]) If I_1 and I_2 are the intensities of the components of the scattered light polarized perpendicular and parallel to the plane of incidence and scattering respectively, then the degree of polarization of the scattered light is defined as $P = (I_1 - I_2)/(I_1 + I_2)$ In this application, the cloud is assumed to be illuminated by natural light from the Sun The theory predicts that the polarization and intensity of scattered light are functions of the scattering angle φ, the size parameter $x2 = \pi r/\lambda$, where r is the radius of the particle and λ the optical wave-length, and of nx, where n is the refractive index of the particle At low elevation angles, selective extinction in the atmosphere is serious, but there is no reason for expecting the polarization to be significantly affected This is an important advantage of polarization over spectral observations

In Fig 1 the horizontal scale is the computed scattering angle and the vertical scale is the degree of polarization The limiting case of Rayleigh scattering is shown by the solid curve The broken lines show the predicted polarization for particles with x = 1 0, 1 2 and 1 5, as indicated, if the refractive index n is 1 55 For n = 1 33 (water) the values of x are those given in brackets Measured polarization values are shown by the symbols, which are of different shape for different pairs of exposures Seven blue and eleven red exposures were made on various parts of the cloud over a period of 3 hr Open symbols refer to the blue wave-length, and filled symbols to the red

Points to note are as follows The observed behaviour is of the kind predicted by the theory for a rather limited range of particle sizes, and the same range of sizes accounts for the results on the two separate wave-lengths Systematic errors of analysis could scarcely be invoked to account for this regularity of behaviour Thus a value of the radius r = (1 0 ± 0 1) 10^{-5} cm (n = 1 55) accounts for the results There is evidently not an appreciable proportion of particles of larger than 2 × 10^{-5} cm radius , one cannot say if there are smaller particles present There is no evidence, so far, of any change in the effective radius during the progress of the display, or from place to place in the cloud

Further polarization measurements are being made Stereophotogrammetric results obtained at Torsta on the same cloud have shown that the material of the cloud moved in a south-westerly direction with a velocity of the order of 100 m /s , while a system of bright waves moved more slowly in the reverse direction The effect has been demonstrated in a convincing manner by time-lapse films taken of these and subsequent clouds It is the movement of the bright waves which has commonly been reported in the past[4]

I am indebted to Dr and Mrs F Volz, and Mr N Wilhelm for valuable assistance The astronomical institutions of Stockholm and Uppsala provided the facilities for microdensitometry

REDUCTIVE PHOTO-BLEACHING OF EOSINE

Primary Processes indicated by the Flash Technique

IT is well known that a de-aerated solution of eosine in ethanol when irradiated undergoes reductive bleaching. Imamura and Koizumi[1] concluded, from the kinetic studies of this reaction, that a semiquinone radical with a life-time not less than 10^{-3} sec. is formed from the triplet state of dye and ethanol.

The primary processes of this photo-bleaching have now been studied by the flash technique, and in addition to semiquinone, another intermediate with a life-time of the order of 10^{-3} sec. was found spectroscopically. A photolysis flash lamp and a spectro-flash of 'half-width' approximately 60 and less than 20 μsec. respectively were used. The results obtained may be summarized as follows.

At 0.6 msec. after the start of the photolysis flash, the main absorption of eosine decreased to 60 per cent of that of the initial solution and a transient increase of absorbance was observed in the region from 350 to 480 mμ. Subtracting from this the absorbance due to the remaining eosine, the quantity of which was evaluated from the depression of the absorbance in the region of wave-lengths longer than 480 mμ, the spectra of the transient species were obtained (see Fig. 1).

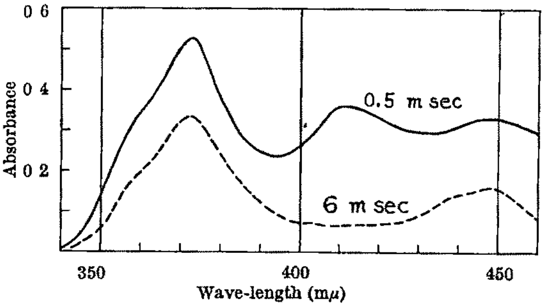

Fig. 1. Absorption spectra of transient species in eosine

Three peaks occur, at 373, 410 and about 450 mμ. After 5 msec., the peaks at 373 and 450 mμ (*A* band) still maintained considerable intensity, whereas 410 mμ (*B* band) declined appreciably. After several minutes, the former band also completely vanished and the eosine spectrum was recovered, corresponding to 88 per cent of that of the original solution. The 12 per cent loss is attributable, without doubt, to permanent bleaching.

In the presence of air, neither transient spectral change nor permanent bleaching was observed. The de-aerated aqueous solution of eosine also showed no such transient spectral change.

These results imply that two transient species are formed in the initial stage of the reductive photo-bleaching of eosine, and that at a certain early stage after flashing, most of the dye molecules are converted into such intermediate species with life-times not less than about 10^{-3} sec.

There is little doubt that the *A* band is due to the semiquinone radical of eosine. As regards the *B* band, it is certain that this is not due to a triplet state, because no similar band is observed in an aqueous solution in which the triplet state is not deactivated so efficiently as in ethanol solution. Hence the *B* band must be attributed to some unknown molecular species which perhaps precedes semiquinone; it would be reasonable to attribute this to a certain kind of molecular complex between excited dye and ethanol.

The primary processes of the photo-bleaching may be pictured as follows:

$$\begin{array}{lllllr} D & + \; h\nu & \rightarrow & D^{*} & & (1) \\ D^{*} & & \rightarrow & D & + \; h\nu' & (2) \\ D^{*} & & \rightarrow & D^{t} & & (3) \\ D^{t} & + \; RH & \rightarrow & X & & (4) \\ X & & \rightarrow & D & + \; RH & (5) \\ X & & \rightarrow & DH^{\cdot} & + \; R & (6) \end{array}$$

where D and RH represent dye and ethanol, and X is the molecular complex suggested above; the other symbols have the usual meaning. This scheme accounts for all the experimental results, including those formerly obtained from kinetic studies. Only two of them will be taken up here. (*a*) The observation that only 12 per cent is permanently bleached in spite of the fact that almost all the dye molecules are converted to intermediates with life-times not less than about 10^{-3} sec. is due to process (5), which plausibly proceeds faster than (6). (*b*) The fact already established that the reductive photo-bleaching is completely inhibited by the presence of a very small quantity of oxygen is interpreted as due to X being deactivated by oxygen by the process $X + O_2 \rightarrow D + RH + O_2$. Imamura and Koizumi's scheme that semiquinone is destroyed by oxygen is not in agreement with the fact that the *B* band is not observed in the aerated ethanol solution.

SHUNJI KATO
MASAO KOIZUMI

Effect of Added Substances on the Rate of Reductive Photo-bleaching

THE alcoholic solution of eosine, when de-aerated and irradiated by visible light, undergoes photo-bleaching which proceeds via the formation of a semiquinone of the dye[1]. The effect of the added substances on the rate of bleaching has now been examined, and it is found that some substances accelerate the rate appreciably and in a very specific manner.

A sample degassed carefully by repeated vacuum distillation was illuminated by light from a tungsten projection lamp, transmitted through a filter cutting off wave-lengths less than 450 mμ.

Since the absorption spectra of the irradiated solution, in all cases, gradually declined, keeping the same shape as that of the original solution, the rate of bleaching was traced simply by measuring the absorption spectra at suitable time intervals with a Hitachi spectrophotometer *EP U-2A*.

The rate of bleaching can always be expressed by the formula:

$$-\frac{dc}{dt} = \frac{k}{d} I_0 \left\{ 1 - \exp(-\alpha c d) \right\} \times 10^3 \qquad (1)$$

where c is the concentration of dye in mole/litre, I_0 is the intensity of illuminating light (mole cm.$^{-2}$ sec.$^{-1}$), α is the effective molar absorption coefficient and d the thickness of the solution in centimetres.

Integration of (1) gives:

$$\ln(\exp \alpha c_0 d - 1) - \ln(\exp \alpha c d - 1) = 10^3 k I_0 \alpha t \qquad (2)$$

By using the properly determined value of α, one can obtain k from the inclination of a linear plot of $\ln(\exp \alpha cd - 1)$ against t

Typical results showing the effect of the added substances are summarized in Table 1 (temperature, 25° C)

Table 1

Retarding Effect

*Iso*pentane		*n*-Hexane	
Mole fraction	Relative k	Mole fraction	Relative k
0 334	0 20	0 309	0 59
0 143	0 43	0 130	0 67
0 0814	0 84	0 073	0 89
0 0529	0 85	0 047	1 01
0	1	0	1

Benzene		*Cyclo*octatetraene	
Mole fraction	Relative k	Mole fraction ($\times 10^5$)	Relative k
0 220	0 61	650	0
0 141	0 63	65	0 26
0 0681	0 69	32 2	0 42
0 0334	0 70	8 07	0 61
0	1	0	1

Accelerating Effect

n-Hexene		*Cyclo*hexene	
Mole fraction	Relative k	Mole fraction	Relative k
0 0181	3 62	0 0295	6 4
0 0119	2 69	0 0146	3 53
0 00593	1 99	0 00726	2 43
0 00296	1 74	0 00362	1 71
0	1	0	1

Since all these substances scarcely affect the absorption or fluorescence of eosine, the effect on the rate ought to be caused mainly by their interaction with the triplet state of the dye, or with any other species produced from it If one assumes, as has usually been done, that the triplet state is deactivated by the retarding substances (Q-groups), according to the process $D^t + Q \rightarrow D + Q$, then the relation

$$\frac{1}{k} = a + b[Q]/[R\text{H}] \qquad (3)$$

must hold approximately, where RH is ethanol

This fits the experimental results The effect of *n*-hexene and *cyclo*hexene is very specific in that the rate increases according to the relation (Fig 1)

$$k = a' + b' [P] \qquad (4)$$

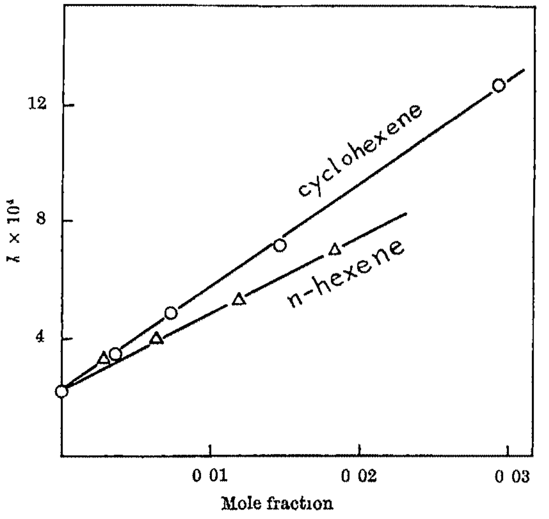

Fig 1 Plot of k against the concentration of the added substances

Assuming that these substances also attack the triplet state, then the above relation implies that the attack mainly results in the formation of semiquinone without any accompanying measurable deactivation process. This is rather curious in view of the behaviour of the Q group

Another possibility to be taken into consideration is that P attacks a complex between excited dye and ethanol, (D H—R), since the complex formation has now been confirmed by the flash experiments (preceding communication)

If one assumes that the two substances of the P group attack (D H—R) only in such a specific manner that R is detached from the latter, producing a more stable radical PR and leaving behind DH , then the rate of bleaching would be increased and the relation (4) can be accounted for

A definite conclusion must, however, await further work, especially by the flash technique, since the introduction of the complex has made it necessary to examine more carefully whether the added substances of the P group and also those of the Q group attack chiefly D^t or ($D \cdot$ H—R)

CONTROL OF HATCHING IN THE PREDIAPAUSE EGGS OF *AEDES* MOSQUITOES

By Dr J D GILLETT

East African Virus Research Institute, Entebbe, Uganda

EGGS of *Aedes* mosquitoes are usually laid above water-level, where they may remain viable for long periods while awaiting submergence On flooding, however, they do not usually all hatch together, even though they may all be the same age Indeed, hatching, even in continuously submerged eggs, may go on in small instalments over a period of many months This erratic hatching-response is well known, and results in a temporal spread of newly hatched larvæ—an obvious advantage to species which tend to utilize small collections of water subject to irregular changes in level and to sudden drying To the experimental worker, however, wanting large numbers of larvæ of the same age, erratic hatching is a nuisance Hence, much of the work that has been done on this subject has tended to ignore the biological significance of erratic hatching and has concentrated on a search for a stimulus that will make all eggs hatch together Many such stimuli have been described over the past forty years, and the references are too numerous to include here , suffice it to say that most of these involve a lowering of the amount of dissolved oxygen in the water[1] While it is obviously useful to know what can stimulate hatching in *Aedes* eggs, it is, perhaps, of greater biological interest to study the factors which inhibit it

It has previously been shown that, shortly after reaching embryonic maturity, unhatched but submerged and apparently hatchable eggs of *Aedes* (*Stegomyia*) *aegypti* (L) are overtaken by a state of genetically determined diapause, the depth of which varies with the passage of time, the manner of this variation with time itself varying from one egg to another[2,3] This obligate diapause differs in certain respects from many other instances of diapause[4,5] and can be broken at any stage by the application of a maximal stimulus[3] In Nature, however, it is probable that this strength of stimulus is never found, and hence only a few eggs hatch each time a stimulus occurs Thus, hatching by small instalments is ensured, once diapause has been entered The onset of diapause, however, does not always coincide with the attainment of embryonic maturity and a variable amount of hatching sometimes occurs before diapause has been reached Indeed, prediapause hatching is usual in *A* (*S*) *africanus* Theo , *A* (*S*) *apicoargenteus* Theo , *A* (*Finlaya*) *longipalpis* Grunb and in some strains of *A* *aegypti*[2]

In a strain of *A* *aegypti*, colonized in Entebbe, Uganda, in 1958, from eggs sent from Ilobi, Nigeria, by Mr J P T Boorman, prediapause hatching in a proportion of submerged eggs occurs on days 3 and 4 after laying , entry to diapause of the remaining unhatched eggs occurs on day 5, after which no further hatching occurs in the absence of a hatching stimulus The proportion which thus hatch during the prediapause state varies widely from one batch of eggs to another, all proportions having been recorded from 0 to 76 per cent Faced with this extreme degree of variability, it is a remarkable fact that never do they all hatch during the prediapause period It would appear that some mechanism comes into play which prevents unchecked hatching during this precarious period, thus ensuring that at least some eggs reach the diapause state It was postulated, therefore, that the first eggs to hatch might make conditions less favourable for the remaining unhatched eggs

In order to test this hypothesis it was first necessary to minimize variation by randomizing the eggs for parentage This was easily achieved by setting up a special colony of about 500 males and 500 females, reinforced by about 50 newly emerged adults of each sex per week, and making daily collections of the eggs which had been laid communally on a single small piece of moist filter paper When laying, the females do not deposit all, or even many, of the eggs in one place, but walk over the surface of the paper, stopping every few seconds to attach a single egg here and another there, and so on It follows that, by the time egg-laying activity is finished, which in this species is restricted to the last two or three hours of the daylight period[6], a mass of eggs results, any portion of which will be of mixed parentage It was taken as axiomatic that early-laid eggs usually reach embryonic maturity, and thus tend to hatch, before late-laid eggs, and the following account may be considered as an investigation into the possibility that hatching in early-laid eggs depresses hatching in late-laid eggs

Eggs laid on filter paper on a single day were carefully washed and submerged in tap water on the day of laying These are referred to as group *A* eggs For ease of handling and subsequent counting, the day's lay was arbitrarily divided into ten sub-groups by cutting the paper at convenient places—each piece of paper bearing approximately the same number of eggs Each piece was placed in a sterile glass tube containing 3 ml tap water 24 hr later the next day's lay was similarly treated (group *B*), but the pieces of paper bearing the eggs were placed in the tubes of water already containing the group *A* eggs Thus, each tube contained two pieces of paper bearing eggs, one (group *B*) being 24 hr younger than the other (group *A*) Both groups were kept submerged for five days at a temperature of 29° C and in constant light The papers bearing the eggs were removed on day 5 (group *A* on one day, group *B* on the following day), and the hatched eggs counted under a binocular dissecting microscope The papers were then placed in a medium containing a maximal stimulus for a period of 24 hr in order to test for viability of the unhatched eggs[3] The response was expressed as the number of eggs which hatched within five days, out of the total number of viable eggs present The result of this initial trial (combining the ten sub-groups) supported the hypothesis that hatching in early-laid eggs depresses hatching in companion late-laid eggs , 51 per cent of group *A* eggs hatched (226/440), 26 per cent of group *B* eggs hatched (126/478) Nevertheless, with such variable material, it was decided to make a total of ten such trials, with ten sub-groups in each The full results, including those of trial 1, are shown in Table 1, from which it will be seen that all the results are in the

expected direction, the hatch in group *B* being significantly lower ($P < 0\ 001$) in every trial except trial 7

While these results are consistent with the hypothesis, they can, of course, be interpreted in the reverse way that the presence of group *B* eggs in some way enhanced the hatch in group *A* Therefore, a more critical experiment was planned using separate controls for groups *A* and *B* Eggs of group *A* were set up as test and control groups Similarly, eggs of group *B* were set up as test and control groups, group *B* test eggs being added to the water already containing the group *A* test eggs The response was expressed as the proportion of group *A* test eggs which hatched within five days compared with the proportion of group *A* control eggs which hatched in the same period, and the proportion of group *B* test eggs which hatched within five days compared with the proportion of group *B* control eggs which hatched in the same period Again, ten such trials were made with ten sub-groups in each trial, but the interval between the laying of groups *A* and *B* was varied from between 1 and 2 hr to 48 hr The results are shown in Table 2, and fully support the interpretation of the preliminary ten trials

These consistent and clear-cut results based on large numbers of eggs leave little doubt that the first eggs to hatch in some way influence the remaining unhatched prediapause eggs Now, prediapause hatching is spread over a period of about 24 hr on days 3–4, which is much longer than would be expected on the strength of the age differences in a mass of eggs laid in a single egg-laying period of 3 hr While some of this scatter probably owes its origin to innate variation on the part of the eggs themselves, it is perhaps increased by an influence from the first eggs to hatch It seems possible that as the number of early hatchers increases there is a progressive delay in hatching of the remaining eggs until further hatching is prevented by the onset of diapause on day 5 This preliminary interpretation receives some support from the results of a pilot trial Eggs obtained during a single egg-laying period were divided into three groups, *A*, *B* and *C* 24 hr later 100 and 1,000 newly hatched larvæ were added to groups *B* and *C*, respectively. The proportion of eggs which hatched in the three groups by day 5 was as follows group *A* (control with 0 larvæ) 362/678 (53 per cent), group *B* (100 larvæ) 323/673 (48 per cent), group *C* (1,000 larvæ) 270/721 (38 per cent) While these results are consistent with this view, and the differences are not only in the expected direction, but that between groups *B* and *C* is highly significant ($\chi^2 = 15\ 838, P < 0\ 001$), they would obviously have to be repeated many times before they could be accepted with confidence

There is no information yet on whether the influence results indirectly from metabolic contamination of the medium, or directly from the action of some specific diffusible hormone Preliminary trials have not shown any change in *p*H of the medium during this period, even when very large numbers of eggs are involved Some very interesting work has recently been done on the changes in permeability of the chorion in *Aedes* eggs which occur during the transition from the prediapause to the diapause state[7,8], and it would be interesting to know if these changes are affected by the presence of recently hatched larvæ in the medium

Contrary to these findings, some of the early work on egg-hatching in this genus indicated that the presence of larvæ may induce hatching in eggs kept in the same container[9,10] It is important to note, however, that these former results were obtained with eggs in the diapause state, in a later paper evidence will be presented which indicates that hatching in diapause eggs may, in fact, induce hatching in companion diapause eggs by lowering the threshold of response to a given stimulus Thus, whereas hatching in the prediapause state depresses further hatching, the reverse holds for diapause eggs

ROLE OF A DAGGER NEMATODE (*XIPHINEMA* SP.) IN OUTBREAKS OF PLANT DISEASES CAUSED BY ARABIS MOSAIC VIRUS

By DR B D HARRISON
Rothamsted Experimental Station,
Harpenden, Hertfordshire

AND

DR C H CADMAN
Scottish Horticultural Research
Institute, Invergowrie, by Dundee

FOR many years arabis mosaic virus was solely of academic interest, having been found by Smith and Markham[1] only in a single plant of *Arabis* sp growing in an insect-proof glasshouse at Cambridge, England its natural mode of spread was unknown Recently, however, one of us (C H C, ref 2) has shown by serological tests that raspberry yellow dwarf virus, a soil-borne virus described in 1958 by Harrison[3], is closely related to and should be regarded as a strain of arabis mosaic virus Hence arabis mosaic virus clearly has a wide host-range, for raspberry yellow dwarf virus causes severe diseases in raspberry var Malling Exploit and in several strawberry varieties[3,4] It also occurs naturally in white clover and in several weed species[3], and it is one of several viruses involved[2] in the etiology of cherry diseases of the rasp-leaf type[5] Moreover, it has been found on the continent of Europe[2] as well as in widely separated parts of England, Scotland and Wales[3,6]

Little is known about the manner in which soil-borne viruses survive in soil and infect plants, but Hewitt, Raski and Goheen[7] have presented evidence that grape-vine fanleaf virus is transmitted by *Xiphinema index*, a large ectoparasitic, soil-inhabiting nematode with a long mouth-spear Infections with fanleaf virus occurred when *X index*, collected from soil around the roots of diseased grape plants, were transferred to pots of sterilized soil in which healthy grape plants were growing Moreover, the virus persisted with the nematodes when they were added to soil as much as 30 days before the grape plants[8]

Dagger nematodes (*Xiphinema* spp) were first recorded in Britain in 1959 They were found in Kent[9], in soil collected from the site of an outbreak of arabis mosaic virus in strawberry, and also on land cropped with white clover in Somerset[10] We too[11] have noted the presence together of *Xiphinema* and arabis mosaic virus at sites in Somerset and Pembrokeshire, and we now present the results of experiments in which the virus was regularly transmitted when dagger nematodes were present but not otherwise Very recently, Jha and Posnette[12] have also suggested that *Xiphinema* transmits this virus, for some healthy strawberry plants, growing in pots containing pasteurized soil, became infected when suspensions of dagger nematodes, from soil infested with arabis mosaic virus, were added to the pots

Distribution of *Xiphinema* in Crops affected by Arabis Mosaic Virus

Diseases thought to be caused by arabis mosaic virus were found in widely separated parts of Britain[6] Outbreaks in raspberry, strawberry and white clover were selected for detailed study of (*a*) the identity of the viruses involved, (*b*) the distribution of diseased plants, (*c*) the distribution of dagger nematodes, and (*d*) the infectivity of soil from diseased and healthy parts of crops

The viruses were identified serologically isolates from each of the sites listed in Table 1 precipitated specifically with an antiserum to arabis mosaic virus Diseased plants occurred in patches at all the sites Infected raspberry and strawberry plants showed typical symptoms, infected white clover plants usually had chlorotic blotches on their leaves The virus was consistently isolated from diseased plants but not from normal-looking plants growing outside the patches The soil samples were collected during a period of 12 weeks Aliquots (300 gm) of top-soil were used either to estimate the numbers of dagger nematodes present, or to grow a crop of pea seedlings (var Onward) in an insect-proof glasshouse Four weeks after sowing, the seedlings were washed free from soil and sap from their roots was inoculated to leaves of *Chenopodium amaranticolor* to find how many of the seedlings had become infected the proportion infected was taken as an estimate of the infectivity of the soil The dagger nematodes were extracted from the soil by a sieving technique similar to that described by Goodey[13] large pieces of plant debris were first removed from the muddy soil suspension and this then passed through a 50-mesh sieve, which retained *Xiphinema* The material

Table 1 ASSOCIATION OF *Xiphinema* WITH OUTBREAKS OF DISEASES CAUSED BY ARABIS MOSAIC VIRUS

Locality	Crop	Soil type	No *Xiphinema* per 300 gm soil	Infectivity of soil*
Methwold, Norfolk	Raspberry (*a*) healthy area	Black peat fen	0	0/2
	(*b*) diseased area	Black peat fen	12	8/8
	(*c*) diseased area	Black peat fen	27	—
Tenby, Pembrokeshire	Strawberry (*a*) healthy area	Heavy loam	0	0/7
	(*b*) diseased area	Heavy loam	4	5/6
Fareham '*A*' Hampshire	Strawberry (*a*) healthy area	Light shingle	1	0/3
	(*b*) diseased area	Light shingle	34	4/5
Fareham '*B*', Hampshire	Strawberry (*a*) healthy area	Light shingle	0	0/8
	(*b*) diseased area	Light shingle	9	7/10
Crewkerne, Somerset	White clover (*a*) healthy area	Moist sandy loam	0	—
	(*b*) diseased area	Moist sandy loam	35	2/3

* Five pea seedlings were grown for 4 weeks in each 300-gm aliquot of soil The incidence of virus infection was then determined by inoculating sap from the pea roots to leaves of *Chenopodium amaranticolor* Numerator is the number of lots of soil in which pea seedlings became infected, denominator is the total number

Table 2 EFFECT OF CHEMICAL TREATMENTS ON THE NEMATODE POPULATION AND INFECTIVITY OF SOIL

Chemical added to soil*	No *Xiphinema* per kgm soil 6 weeks after treatment†		No living 'small nematodes'‡ per kgm soil 6 weeks after treatment	Infectivity of soil§ (No pots containing infected seedlings)
	Living	Dead		
None	21	0	5,029	8/12
Ethylene dibromide (0 4 ml /litre soil)	0	0	1	0/12
Pentachloronitrobenzene (1 gm 20 per cent dust/litre soil)	0	5	4,608	0/12
Tetramethylthiuramdisulphide (2 gm 10 per cent dust/litre soil)	0	24	272	0/12

* The mixtures of soils and chemicals were stored in sealed tins for 2 days They were then potted and pea seeds (5 per pot) planted after a further 2 days Pentachloronitrobenzene and tetramethylthiuramdisulphide dusts were provided by the Murphy Chemical Co

† Before treatment the soil contained about 36 *Xiphinema* per kgm soil

‡ 'Small nematodes' includes all nematodes that passed through a 50-mesh sieve but were retained on a 160-mesh sieve

§ Six weeks after planting, the incidence of infection in the pea plants was estimated as described in Table 1 Numerator is the number of pots containing infected seedlings and denominator is the total number of pots used

extracted on the sieve was examined in a syracuse dish under a binocular microscope This method was shown to recover at least 75 per cent of the *Xiphinema* in the soil

Table 1 gives results for a selection of sites, and shows that, although arabis mosaic virus was previously recorded only in soils of medium-heavy texture[4], it is not restricted to these, and that serious disease outbreaks also occur on black fen and shingle soils[6] All the samples from soil inside patches of diseased plants were infective and all contained *Xiphinema*, whereas soil from outside such patches was not infective and, with one exception, did not contain *Xiphinema* At the exceptional site, Fareham '*A*', a single dagger nematode was found in 300 gm soil collected outside the diseased area Each population of dagger nematodes contained both larvæ and adults, but the proportion of adults varied from less than 5 per cent to 30 per cent at different sites The total numbers of *Xiphinema* varied considerably between sites but were never large, suggesting that if dagger nematodes are involved in virus transmission, only a few are needed to enable the soil to become highly infective Indeed, the numbers recovered from five 300-gm lots of Fareham '*B*' soil, in each of which pea seedlings had become infected, were 3, 4, 5, 9 and 10, respectively · 5, 9 and 17 *Xiphinema* were isolated from three similar lots in which the seedlings had remained healthy Soils collected from under diseased plants at several additional sites all contained *Xiphinema*

Tests with Isolated Dagger Nematodes

Results of soil fractionation experiments, in which infective soil was suspended in water and then passed successively through 25, 50 and 160-mesh sieves, showed that each sieve retained infective material but that the fraction of soil passing through the 160-mesh sieve was not infective The distribution of infectivity roughly paralleled that of the dagger nematodes Other tests showed that soil extracts of the type used for counting *Xiphinema* (made using a 50-mesh sieve) conferred infectivity on sterilized soil Attempts were therefore made to separate the dagger nematodes from the other animals and materials in these extracts The extracts were thoroughly washed on a 160-mesh sieve, re-suspended in water, the dagger nematodes were picked out with a wire handling-needle and transferred, first to watch-glasses containing distilled water, and then to pots containing virus-free soil The extract residues were added to other similar pots of soil All the pots were planted with peas, which were tested for the virus four weeks later No plants growing in virus-free soil or in soil to which the extract residues had been added became infected, but plants growing in soil infested with hand-picked *Xiphinema* did In three experiments, in which 15–20 dagger nematodes were added to each pot, 2 out of 11, 4 out of 12 and 1 out of 13 pots contained infected pea seedlings In one experiment the dagger nematodes were separated, in batches of 20 into adult males, adult females and larvæ Infection occurred with each of two batches of males, with two out of three batches of females but with none of six batches of larvæ In a second similar experiment, infection occurred with two out of sixteen batches of larvæ but with none of twelve batches of adults Serological tests on several of the virus isolates from pea seedlings exposed to hand-picked *Xiphinema* confirmed that each was arabis mosaic virus Isolates from plants exposed either to male or to female *Xiphinema*, or to larvæ, were among those identified serologically

Chemical Treatment of Infective Soil

The infectivity of soils containing tomato black ring virus is abolished by treatment with each of several different chemicals, some of which seem to have little or no effect on infectivity of the virus *in vitro*[11] Table 2 shows the result of treating soil containing arabis mosaic virus with some of these substances After peas had been grown in them for six weeks, no living dagger nematodes were found in any of the soils treated with chemicals, and from the fact that no plant growing in these soils became infected, it seems probable that the *Xiphinema* were either killed quickly or deterred from feeding on the plants Table 2 also contains two other items of note First, many dead *Xiphinema* were found at the end of the experiment in soil treated with tetramethylthiuramdisulphide, suggesting either that they had died only recently or that the chemical had prevented their decomposition Secondly, although counts of other large eelworms, for example, *Dorylaimus* spp , paralleled those for *Xiphinema*, pentachloronitrobenzene (and in some experiments tetramethylthiuramdisulphide) seemed, at the doses used, to have little effect on the numbers of 'small eelworms' (all eelworms that passed through a 50-mesh sieve but were retained on a 160-mesh sieve) In the soil, these chemicals appear to have differential effects on different kinds of nematodes

Air-drying soil at 20° C for a week is another treatment that abolishes the infectivity of soil containing arabis mosaic virus[11] Here again, the effect is most plausibly explained by the treatment killing *Xiphinema*, for after a week of air-drying, only 25 dagger nematodes, all dead, were isolated from 1 kgm of soil, whereas 64, all alive, were found in a similar lot kept moist

Conclusions

Throughout our work the infectivity of soils and of preparations from soils has been correlated with the presence of living dagger nematodes Moreover, the fact that *Xiphinema* was absent or rare outside patches of diseased plants suggests that the nematodes are often the limiting factor in the spread of arabis mosaic virus We have found *Xiphinema* only in fields where arabis mosaic virus occurs

In the soils we have used, arabis mosaic virus seems associated only with the dagger nematodes Neither the residue left after their removal from infective extracts, nor the material passing through a sieve which retained the dagger nematodes, was infective All the evidence points to *Xiphinema* as being the vector of arabis mosaic virus, and it may seem unnecessarily cautious to mention the possibility that the virus could be associated with the nematodes in such a way that they are not acting as virus vectors in the usual sense The evidence for virus transmission by the nematodes is as good as, but no better than, that commonly accepted as indicating that insects are vectors of plant viruses If dagger nematodes are virus vectors in the usual sense, a role for which they seem well fitted, it is clear that they can be quite efficient For example, the tests made on infective soil from Tenby (Table 1) suggest that about 1 in 3 of the dagger nematodes transmitted the virus Then again, in one of the experiments with hand-picked dagger nematodes, an estimated 1 in 12 of adults transmitted the virus, despite the probability that the soil and environmental conditions were not optimal for them Although we found there was no need to provide the nematodes with fresh sources of virus, had this been done, the rates of transmission by hand-picked nematodes might have been higher This possibility, and the mechanism of virus transmission, are the subject of further investigations

Losses of crop from arabis mosaic virus can probably be avoided in raspberry by growing immune varieties, such as Malling Jewel[14], but it is uncertain whether other crop species also contain immune varieties However, if dagger nematodes spread the virus, additional methods of control seem possible The results of treating soils with chemicals show that *Xiphinema* is as sensitive to them as are some small plant-parasitic nematodes[11], possibly more so, for dagger nematodes were killed by the action of some substances commonly used as fungicides and not as nematicides The fact that many soils contain only relatively few *Xiphinema* also encourages the view that soil nematicides will be effective in controlling the diseases The problem is now a practical one, namely, to incorporate the nematicide into soil sufficiently evenly and to a sufficient depth to ensure a high percentage kill of the population at an economically acceptable cost

The taxonomic status of the dagger nematode used in our experiments is still being studied in detail, but preliminary results (Goodey, J B , Peacock, F C , and Pitcher, R S , unpublished observations) suggest it is closely related to, and possibly identical with, *Xiphinema diversicaudatum* Micoletzky, and thus differs from the one associated with grape vine fanleaf virus in California[7] Whether the two viruses are serologically related is unknown, but fanleaf virus has not been transmitted to species outside the Vitaceae or by mechanical inoculation of sap But even if these two viruses are closely related, they are unlikely to be the only ones the spread of which depends on soil-inhabiting nematodes Indeed, evidence was recently advanced that the transmission of peach yellow bud mosaic virus is associated with *Xiphinema americanum*[15] Several viruses resemble arabis mosaic virus in possessing a wide host-range, in the type of symptoms they cause, in their *in vitro* properties[14,16] and in having isometric particles of approximately 25 mμ diameter (Harrison, B D , and Nixon, H L , unpublished observations) With one of these viruses, tomato black ring, there is already evidence that an agent in soil plays a part in virus transmission[11], and it is among such viruses that additional nematode-transmitted types seem most likely to be found

We are much indebted to Dr J B Goodey for advice and for permission to refer to his unpublished work

ULTRACENTRIFUGATION AND STAINING OF *HEVEA* LATEX

By G F J MOIR

Rubber Research Institute of Malaya, Kuala Lumpur, Federation of Malaya

COOK AND SEKHAR, in 1953[1], described the separation of *Hevea* latex into phases by high-speed centrifugation and interpreted their results in terms of the types of particle which had been found by various earlier workers in latex after collection from the tree In particular, the sedimented material was considered to represent an aggregation of the lutoid particles discovered by Homans and van Gils[2] Cook and Sekhar's method has been used continually in these laboratories in the preparation of latex fractions for chemical and enzymological investigations[3], and there is no doubt as to the general correctness of their conclusions However, more recent observations seem to show that the sedimentable material in latex cannot consist wholly of one species of particle, and that the non-sedimentable components of latex are also more complex than was thought hitherto A short account of these observations seems

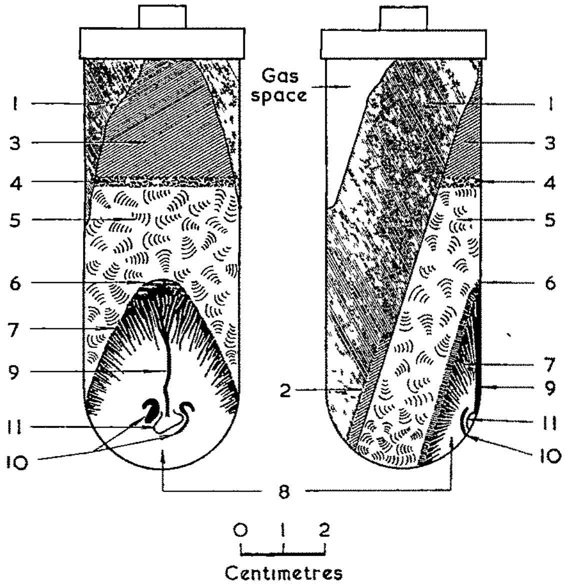

Fig 1

timely , there is current interest in the biochemistry of *Hevea*[3-6] and high-speed centrifugation of latex is being used in other laboratories besides our own[4]

In the present work, latex was obtained from a small stand of buddings of the clone Prang Besar 186 of *Hevea brasiliensis* These trees were mature and had been tapped by the half-spiral alternate-daily system[7] for many years The latex was collected for 30 min after tapping, into glass vessels kept in ice baths It was centrifuged at 53,620g(max) for 40 min in Rotor No 21 (prechilled to 0°) of a Spinco Model *L* ultracentrifuge The temperature of the latex thus fell to 0–5° C soon after leaving the tree and remained in this range virtually throughout the fractionation Such close temperature control was not used in the earlier work cited[3], although this point is not always clear in the published accounts

Fig 1 shows diagrammatically the separated zones regularly observed after centrifugation Two views of a single tube are shown , these are not cross-sections, but approximate plane projections of the pattern visible from outside the tube The various zones were distinguishable by colour or texture or both , in a series of experiments extending over ten weeks some variation in detail occurred, but the main features of the pattern were surprisingly reproducible Further definition of the zones and some indication of their possible cytological significance were obtained by treating the latex with trace amounts of janus green *B* or neutral red before centrifugation This procedure produced a pattern which seemed to correspond in all essential respects with that formed from unstained latex, and it thus appeared that the stains do not significantly affect the sedimentation behaviour of the particles present

A full description of the appearance of each of the eleven zones, as observed with and without pre-staining the latex, would be rather voluminous Only the major points will be mentioned here

Zone 1, which is white and opaque, though shaded in the diagram, corresponds with the 'top white fraction' of Cook and Sekhar[1] The much smaller zone, 2, is distinguished from it by a certain translucence and, in latex pretreated with janus green *B* by a bright blue colour (Janus green *B* staining is barely perceptible in zone 1) Zone 3, a white emulsion, appears cognate with zone 2, since it also stains blue with janus green *B* and on more prolonged centrifugation it is reduced in amount while zone 2 is increased Zone 4 (orange) is the 'yellow-orange layer' of Cook and Sekhar[1] , the aqueous zone 5 corresponds with the 'C serum' of earlier literature[3] and zones 6–11 are together broadly equivalent to 'bottom fraction' However, in this connexion it should be noted that the effects of the fully refrigerated technique are considerable in our experiments zone 5 was turbid, and the sedimented material (6–11) was semi-liquid If centrifugation is conducted at higher temperatures as in previous work[3], the serum is clearer and the sediment more nearly solid , the stratification of the latter is also less sharp

Zone 6 is a loose whitish layer on the upper plane of the sediment Agitation re-disperses it largely into zone 5, where it assumes the same ropy texture as the turbidity initially present Prolonged ultracentrifugation of zone 5 at about 140,000g(max) deposits a small gelatinous sediment which gives a positive test for pentose (orcinol reaction)

Zone 7, embedded in the face of zone 8, contains both yellow and whitish material and is unstained by neutral red With janus green *B* the colour of the zone is at first ill-defined, varying from yellowish to dirty green However, when the tube and contents are allowed to warm to 20–25° after centrifugation, the zone becomes bright red

Zone 8, which accounts for the bulk of the sediment, is practically a gel at 0–5°, is greyish-cream in colour and becomes syrupy at room temperature From latex pre-treated with neutral red it is intensely pink and contrasts very strikingly with the unstained zone 7

Zone 9 is a streak of material resembling zone 7 in appearance and staining reactions, but more strongly sedimented It joins zone 7 at the upper end of the pellet, and no clear boundary can be drawn Zone 10 is a ring of deep orange material, and zone 11 a speck of translucent greyish jelly These last two are minute in amount but their presence is generally quite unmistakable

All the above results refer specifically to Prang Besar 186 latex, but preliminary experiments on other latexes indicate a similar complexity Of the particles known to be present in latex after collection, lutoid particles are, by definition[2], readily sedimentable Also Wiersum[8] has reported that they stain with neutral red (under the microscope) It therefore seems that my zone 8 must contain these particles, a conclusion readily reconcilable with that of Cook and Sekhar Similarly, zone 1 must still be ascribed to rubber particles and zone 4 to Frey-Wyssling particles[9], as by these authors

Collected latex also contains bacteria our samples gave viable counts in the range 10^5 to 5×10^6 organisms per ml , by the method of Taysum[10] The total volume of bacteria in one centrifuge tube of latex (90 ml) would probably be small

To explain the observations outlined above, even partially, it seems necessary to postulate the presence in latex, in addition to the particles already mentioned, of the following (1) a variety of particle staining blue with janus green *B* and migrating centripetally (zones 2 and 3) , (2) at least one species of particle which sedimented with difficulty (zone 6 ; further centrifugation of zone 5) , (3) at least one species of particle reducing janus green *B* (zones 7 and 9)

A more complete explanation would necessarily be speculative; my purpose at this stage is primarily to direct attention to the complexity of collected *Hevea* latex. However, it should ultimately be possible to relate the particulate components of the latex to the normal concepts of plant cytology. With this intention, Wiersum[8] has published evidence suggesting that 'lutoids' may be considered as the elements of a polydisperse vacuome. In my observations the component sedimented with difficulty has suggestive similarities to the particulate ribonucleoprotein ('microsomes') now well known in animal cells and also reported in higher plants[11]. Further, McMullen[3] has recently detected ribonucleoprotein in freeze-dried latex serum. The reaction of zones 7 and 9 with janus green is essentially the same as that reported for liver mitochondria by Recknagel[12] using a closely similar experimental method. Reactions with janus green must, of course, be interpreted with reserve, especially perhaps in the presence of bacteria.

It should also be possible to relate the components of collected latex to the cytology of the laticifers *in vivo*. The existing literature on this subject, reviewed by Wiersum[8] and Milanez[13], is somewhat controversial, and very little is known of the cytology of latex vessels submitted to regular tapping. Milanez considers that in intact vessels latex is homologous with cytoplasm and not with vacuolar sap, as in the traditional opinion[14], and he has also reported the presence of mitochondria. If these views are applicable to latex collected by tapping, the complexity of latex revealed in the centrifuge would find an explanation.

I am indebted to Mr. W. G. Wren for advice and encouragement, to Ir. P. de Jonge and Mr. D. H. Taysum for valuable discussions and to the last-named also for all bacteriological data and for access to his unpublished microscopic studies on latex. I acknowledge also the technical assistance of Mr. Yap Chin Fah and Mr. Hoh Lian Yong, as well as translations by Dr. J. K. Templeton, Mr. N. G. Bissett and Ir. E. C. Paardekooper. This work, which is continuing, forms part of a programme of research undertaken by the Board of the Rubber Research Institute of Malaya.

GLYCOPROTEINS OF HUMAN CEREBROSPINAL FLUID

By DR. SAMUEL BOGOCH

Department of Psychiatry, Harvard Medical School, Boston

WHILE the cerebrospinal fluid is the only compartment of the central nervous system which can readily and repeatedly be sampled in both man and animals without unphysiological effects, relatively few quantitative data are available on its organic constituents[1]. Micromethods have been developed in this laboratory which permit the analysis of small quantities of cerebrospinal fluid with special reference to the carbohydrate and protein constituents. A total of 236 individual specimens of cerebrospinal fluid have been examined by these techniques.

10–30 c.c. aliquots of lumbar cerebrospinal fluid are immediately lyophilized, quantitatively dialysed in 'Cellophane' at 4° C. against glass-distilled water to completion, with the result that three major fractions are obtained[2,3]: Fraction *G* (non-dialysable, water-soluble in conditions of vanishing ionic strength), Fraction *P* (non-dialysable, water-insoluble), Fraction II (dialysable). Both the original unfractionated cerebrospinal fluid and the resultant subfractions have been quantitatively analysed for total solids, nitrogen, phosphorus, hexose, hexosamine and reducing sugar. In addition, it has been possible by this method to obtain accurate values for the presence of true neuraminic acid in cerebrospinal fluid, since that which is associated with non-dialysable fractions has been freed from the interference of dialysable monosaccharides, and the neuraminic acid which is unbound and dialysable, when present, can be detected by the use of column chromatography ('Amberlite *IRC*-120' for sodium ions, followed by 'Dowex-3-*OH*' for chloride ions, then 'Dowex-1-formate' for neuraminic acid) to separate it from the large excess of monosaccharides present, and by the thiobarbituric acid reaction[4,5]. The values of total neuraminic acid have been found to vary from 2 to 29 μgm./c.c. of whole cerebrospinal fluid, with from 0 to 12 μgm. of the total representing free neuraminic acid. The previous use of the Bial reagent to measure total neuraminic acid in whole cerebrospinal fluid[6,7] gave a somewhat higher range of values due to monosaccharide interference. Individual differences in the concentration of neuraminic acid in cerebrospinal fluid were detected with the Bial reagent, despite the large interference by monosaccharides, because most of these differences have been shown to be the result of variation in the concentration of Fraction *G* neuraminic acid[2].

Table 1 MOLAR QUANTITIES AND RATIOS OF HEXOSE, HEXOSAMINE AND NEURAMINIC ACID IN FRACTION *G* OF INDIVIDUAL SPECIMENS OF CEREBROSPINAL FLUID

Total solids in Fraction *G* (mgm /c c) cerebrospinal fluid	Molar ratios			Molar ratio
	Hexose (as glucose)	Hexosamine (as galactosamine)	Neuraminic acid	Hexose Hexosamine
0 338	1 4	5 6	1	0 25

0 428	13 6	2 2	1	6 18
0 594	6 7	0 7	1	9 58 (10 1)

All the hexosamine in cerebrospinal fluid has been shown to be non-dialysable, most of it being associated with Fraction *G* The absolute quantities of hexosamine (as galactosamine) range from 1 7 to 60 1 μgm / c c whole cerebrospinal fluid (mean 14 4) Fraction *G* hexose (as glucose) has similarly been shown to vary from 4 0 to 88 3 μgm /c c whole cerebrospinal fluid (mean 25 7) The distributions of the constituent hexose and neuraminic acid have been studied in electrophoretic subfractions of Fraction *G* and have been shown to be associated mostly with α_2- and α_1-globulin fractions, with some samples showing the greatest concentration of these constituents in the β-globulin fraction

Optimal conditions have been established for the hydrolytic release of the constituent carbohydrates of Fraction *G* Utilizing 0 08 *N* hydrochloric acid hydrolysis at 100° C for 20 min , 65 per cent of the original neuraminic acid of the macromolecular fraction was released in dialysable form, together with 60 per cent of the original hexosamine, but only 8 per cent of the original hexose Comparison of these results with the hydrolytic behaviour of brain ganglioside[8] suggests that in the cerebrospinal fluid glycoproteins, as in brain ganglioside, the neuraminic acid and hexosamine moieties are more peripherally located or at least more available to mild acidic hydrolysis than are the hexose moieties Further experiments utilizing 2 *N* hydrochloric acid for different periods of time resulted in the selective liberation of the hexoses, galactose having been shown to be released before mannose Application of these methods to the structural determination of purified cerebrospinal fluid glycoprotein fractions separated by column chromatography is in progress The structural relationship of these carbohydrate constituents is of interest with reference to their membrane, receptor and transport functions demonstrated in other studies in this laboratory[9-11]

The quantitative determination of neuraminic acid, hexosamine and hexose has permitted an examination of the molar ratios of these substances in individual cerebrospinal fluid specimens Rather than finding reasonably uniform molar ratios, wide individual variation has been demonstrated in the ratios hexose hexosamine neuraminic acid, ranging from approximately 1 1 1 to 10 1 1 Table 1 shows a few examples of the variation observed both in absolute amounts of these constituents and in their relative ratios That this variation is not a function of the total amount of Fraction *G* present per c c of cerebrospinal fluid is also shown in Table 1 The total content of solids in cerebrospinal fluid has been shown to tend to increase with age after the second decade The concentration of hexosamine derived from Fraction *G* increases during the same period The concentration of hexose derived from Fraction *G* also increases during this period, but even more greatly than does hexosamine The specific increment of hexose to hexosamine appears to be more marked in the third and fourth decades, the molar ratios of these constituents tending to approach unity after the fifth decade

The possible biological significance of unusual total concentrations of macromolecular hexose, hexosamine and neuraminic acid, as well as of unusual molar ratios and electrophoretic distributions of these substances in cerebrospinal fluid in relation to different neuropsychiatric disorders, is considered elsewhere[12] Perhaps most significant is the fact that there has been demonstrated great individual variation both in the absolute quantities and in the relative ratios of particular carbohydrate constituents of cerebrospinal fluid glycoproteins Whether this potential for individual variation reflects genetically determined normal characteristics or specific chemical patterns of particular functional or disease processes, or both, is yet to be determined The possibility exists that an opportunity is indicated by means of similar studies on other compartments of the nervous system for the definition of chemical bases of individuality

These studies, to be presented in detail elsewhere[13], have been supported in part by grants from the National Institutes of Health (*B*-1221 and *M*-2095) and the Scottish Rite Research Committee, National Association for Mental Health (U S)

FORTHCOMING EVENTS

*(Meetings marked with an asterisk * are open to the public)*

Monday, December 14

Institution of Electrical Engineers (at Savoy Place, London, W C 2), at 5 30 p m —Discussion on 'Why Hi-Fi ?", opened by Mr P P Eckersley

Society of Chemical Industry, Pesticides Group (at 14 Belgrave Square, London, S W 1), at 5 30 p m —Mr P B Cornwell "Insect Control by Gamma Irradiation"

Royal Geographical Society (at 1 Kensington Gore, London, S W 7), at 8 30 p m —Baron G de Gerlache de Gomery "The Belgian Antarctic Expedition"

Tuesday, December 15

Institute of Marine Engineers (at the Memorial Building, 76 Mark Lane, London, E C 3), at 5 30 p m —Mr K Maddocks "Some Aspects of Marine Reactor Security"

Institute of Physics (at 47 Belgrave Square, London, S W 1), at 5 30 p m —Mr K G Freeman "Tubes for Colour Television"

Institution of Electrical Engineers, Measurement and Control Section (at Savoy Place, London, W C 2), at 5 30 p m —Discussion on "Data Handling Problems in Atomic Installations", opened by Dr D Taylor

Wednesday, December 16

Powder Metallurgy Joint Group of the Iron and Steel Institute and the Institute of Metals (in the Hoare Memorial Hall, Church House, Great Smith Street, London, S W 1), at 9 30 a m —Symposium on "The Powder Metallurgy of Magnetic Materials"

Royal Meteorological Society (at 49 Cromwell Road, London, S W 7), at 5 p m.—Dr H Wexler "Seasonal and other Temperature Changes in the Antarctic Atmosphere", Mr W Hitschfeld "Patterns of Hailstorms in Alberta"

Royal Statistical Society (at the London School of Hygiene and Tropical Medicine, Keppel Street, Gower Street, London, W C 1), at 5 15 p m —Sir Hugh Beaver, K B E "Statistics as a Tool of Management" (Presidential Address)

Institute of Petroleum (at 61 New Cavendish Street, London, W 1), at 5 30 p m —Mr A C Hartley "Pipelines"

Institution of Mechanical Engineers (at 1 Birdcage Walk' Westminster, London, S W 1), at 6 p m —Dr S G Hooker "The Future of Air Breathing Engines in Aviation" (James Clayton Lecture)

Society of Chemical Industry, Corrosion Group (at 14 Belgrave Square, London, S W 1), at 6 p m —Discussion of Research Papers recently published by Members of the Group

Society of Instrument Technology (at Manson House, 26 Portland Place, London, W 1), at 7 p m —Mr J F Coales "Random Inputs and Load Variations"

Thursday, December 17

British Computer Society, London Branch (at the Northampton College of Advanced Technology, St John Street, London, E C 1), at 2 30 p m —Discussion on "Conversion between Analogue and Digital Representation".

Society of Chemical Industry, Road and Building Materials Group (at 14 Belgrave Square, London, S W 1), at 2 30 p m and 5 30 p m —Scientific Papers

Institution of Mining and Metallurgy (at the Geological Society, Burlington House, Piccadilly, London, W 1), at 5 p m —Dr A J Robinson "Relationship Between Particle Size and Collector Concentration", Mr D Borchers "Deepening of No 1 Vertical Shaft at Premier (Transvaal) Diamond Mining Co , Ltd "

London Mathematical Society (at the Royal Astronomical Society, Burlington House, Piccadilly, London, W 1), at 5 p m —Prof E V Schenkman "Supersolvable Groups"

Institution of Electrical Engineers, Education Discussion Circle (at Savoy Place, London, W C 2), at 6 p m —Discussion on "The Presentation of the History and Philosophy of Science", opened by Prof H Dingle

Thursday, December 17—Friday, December 18

Physical Society (in the Townsend Lecture Theatre, The Clarendon Laboratory, Oxford), at 10 a m daily—Conference on "Electron-Phonon Interaction in Solids"

Friday, December 18

Society of Chemical Industry, Fine Chemicals Group (at 14 Belgrave Square, London, S W 1), at 6 30 p m —Dr F E Camps "Some Aspects of Forensic Science"

Friday, December 18—Saturday, December 19

British Psychological Society (at University College, Gower Street, London, W C 1)—Conference

Saturday, December 19

Biochemical Society (in the Department of Chemical Pathology, King's College Hospital Medical School, Denmark Hill, London, S E 5), at 10 30 a.m —389th Meeting

APPOINTMENTS VACANT

Applications are invited for the following appointments on or before the dates mentioned

Lecturer (with a good honours degree and teaching experience) in Chemistry at the Nigerian College of Arts, Science and Technology—The Council for Overseas Colleges, 12 Lincoln's Inn Fields, London, W C 2 (December 21)

Technician or Senior Technician in the Department of Pathology, University of Khartoum—The Registrar, University of Khartoum, c/o Inter-University Council for Higher Education Overseas, 29 Woburn Square, London, W C 1 (December 22)

Lecturer in Mathematics in St Salvator's College—Joint Clerk to the University Court, College Gate, St Andrews (December 31)

Lecturer in Statistics in St Salvator's College—Joint Clerk to the University Court, College Gate, St Andrews (December 31)

Lecturer (with a special knowledge of, and interest in, the vertebrates) in Zoology—The Registrar, King's College (University of Durham), Newcastle-upon-Tyne 1 (December 31)

Scientific Officer (with a first- or second-class honours degree in civil engineering or physics, or equivalent qualifications) at the Hydraulics Research Station, D S I R , Howberry Park, Wallingford, Berks, for studies of hydraulic problems in the field of civil engineering, including scale model investigations—The Ministry of Labour and National Service, Technical and Scientific Register (K), 26 King Street, London, S W 1, quoting E 489/9A (December 31)

Technician (preferably with experience in a laboratory concerned with the physiology, biochemistry or the culture of micro-organisms) in the Botany Department, University of Canterbury, New Zealand —The Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W C 1 (December 31)

Senior Lecturer in Clinical Biochemistry at the University of Melbourne, Australia—The Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W C 1 (January 4)

Senior Lecturer (with main interest and special qualifications in the field of petrology) in Geology at the University of Western Australia—The Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W C 1 (January 4)

Reader in Physiology at Middlesex Hospital Medical School—The Academic Registrar, University of London, Senate House, London, W C 1 (January 20)

Assistant Lecturers (with at least a good honours degree in physics, and preferably experience in teaching and/or research) in Physics at the University of Malaya, Kuala Lumpur—The Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W C 1

Biochemist, Basic grade (with a first- or second-class honours degree in chemistry or biochemistry) in the University Department of Medicine, Glasgow, for research work—The Secretary, Royal Infirmary, 84 Castle Street, Glasgow, C 4

Isotope Technician (preferably with a knowledge of biochemistry or electronics) for work in a specialized laboratory dealing with diagnosis, treatment and research in thyroid disorders—The Secretary, New End Hospital, Hampstead, London, N W 3

Lecturer in Veterinary Anatomy at the University of Sydney, Australia—The Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W C 1 (Australia, February 27)

Master to teach Mathematics up to advanced level, with possible scholarship work—The Headmaster, Tonbridge School, Tonbridge, Kent

Specialist Superintendent (Chemist) (with a university degree in chemistry or agricultural chemistry, the higher national certificate in chemistry, or the diploma of the Science Technologists Association, or equivalent qualifications) in the Department of Agriculture, Northern Region of Nigeria, to be responsible for the organization, supervision, and general running of the Chemistry Laboratories at Samaru, and also to undertake certain determinations for research projects—The Director of Recruitment, Colonial Office, London, S W 1, quoting BCD/63/408/018/T

Technician (female, with manual dexterity for preparing small fossils) in the Zoology Department—The Secretary, University College London, Gower Street, London, W C 1, quoting Ref No Zoo/4

SECONDARY AND HIGHER EDUCATION IN BRITAIN

A PAPER entitled "A Policy for Higher Education", published as a special supplement in *Socialist Commentary* of September over the signatures of Mr Robin Morris as chairman, J Vaizey and A H Halsey as rapporteurs, the co-signatories including Prof W J M Mackenzie and M Stewart, M P , is the outcome of three conferences of people from different but appropriate professions, and while representing a compromise between various lively points of view, it is intended as a basis for further discussion It supports the idea of a Royal Commission on institutions of higher education in Britain, but emphasizes the importance of prior thinking if such a Commission is to be effective, and also urges that any such Commission should consider the whole field of higher education rather than concentrate on the universities themselves The paper is not itself concerned directly with secondary education, but its signatories are agreed as to the need for considering carefully the interactions of secondary and higher education

The primary objective of the paper appears to be to ensure equality of opportunity in education, and the writers recognize that this must be based on equality of opportunity in secondary education The argument and implications of Michael Young's essay, "The Rise of the Meritocracy", are clearly in mind, and in the phrase 'equality of opportunity' the last word is generously interpreted One of the major recommendations—the amalgamation of teacher training colleges and colleges of technology into colleges of liberal arts and technology enjoying the autonomy and relation to the community which characterizes the universities proper, and administered by a body analogous with the University Grants Committee but in touch with the work of the local authorities in this field—is intended to meet this need Nevertheless, the paper appears to be somewhat doctrinaire and would have been more convincing had it been based on a thorough and impartial inquiry into some of those matters such as the size of classes, the effect of lengthening the period of compulsory schooling at one end rather than the other, the advantages or disadvantages of large schools as against co-education and of training teachers for three years consecutively, which, in the absence of precise knowledge, are liable to be the sport of political theory or prejudice

On the expansion of higher education, a target of 300,000 full-time students by 1970 is recommended, and of these about one-third should be in technical and teacher training colleges This would involve an increase of 6 or 7 per cent per annum in the number of teachers if present staffing ratios are to be maintained, and in this context it is recommended that improvement of the economic position and status of teachers in universities and institutions of higher education (outside Oxford and Cambridge) is essential The report recommends less specialization at school, but while the signatories may well be right in suggesting that some sixth-form teachers would be more advantageously employed in a college or university, the proposal to shift educational effort from the sixth form to the university is more debatable, and should be based on facts—some of which have still to be determined—rather than theory The economics of any such step are dubious and also its social consequences, quite apart from whether it is really consistent with the true functions of a university

To some extent that is also true of the recommendation that expansion of the provincial universities of Britain should be accompanied by rising standards in staffing ratios, salary scales, buildings, halls of residence, etc , directed at bridging the gap between 'Redbrick' and 'Oxbridge' Heavily increased expenditure on the provincial universities may well be overdue, but this is not necessarily the only, or even the best, way to enable them to attract a larger proportion of the first-class minds in each generation of school-leavers The institution of a council for higher education to determine the allocation of funds for higher education is also recommended, but its position with regard to the University Grants Committee is somewhat ambiguous and no convincing evidence is presented that a new body is required rather than some re-arrangement or expansion of the functions of the latter Although it is recommended that each university should be encouraged to act as a teaching and research centre for the college of liberal arts and technology of its region, the question of technology is very superficially considered , and in seeking to break away from the conception of a university as a place providing specialized training for professional and highly scientific occupations towards one providing general education of a high standard, the signatories of the report seem to become somewhat confused and involved in contradictory policies

Much more fundamental thinking about the purpose and functions of a university is thus required to resolve the issues that are raised in this section of the paper The conception of the university as a place of learning and research as well as of teaching seems to have been overlooked, and while the recommendations on awards and grants are sound, the emphasis on the claims or rights of the individual, particularly in relation to admissions, seems to be excessive and to lose sight of obligations and responsibilities

A national university entrance examination, taken in March, from the results of which individual institutions would select their entrants without further test, is suggested Most of the group wish the Government to use financial pressure to reduce the proportion of entrants to Oxford and Cambridge from private schools , but the minority thought this was more likely to increase than to diminish the predominance of Oxford and Cambridge, and recommends rather that these Universities should no longer enjoy subsidies from public funds. The group recommends that all university students should pass through a diagnostic year of general education before being allocated to suitable courses. It does not discuss the practical implications of thereby extending university education to a fourth year, nor does the feasibility of this year of general education being given in the sixth forms of schools appear to have been considered. Again, it is taken for granted that wide adoption of the tutorial system in higher educational institutions and the consequent high staff–pupil ratio are justified. More experiment in teching methods would be welcomed, but the urgency of such an inquiry, as a preliminary or an essential part of university expansion, is nowhere emphasized; and although it is recognized that heavy teaching duties involve some easing of the demands of research and administration, the complexity of the issues raised thereby is dismissed too lightly. It is admitted that fresh thought is required on the subject of halls of residence, but the thinking of the group here appears to have been guided too much by its political preconceptions, and the part of the library is nowhere mentioned.

Nevertheless, in the section of the paper dealing with residence, there is some realistic thinking, though even here the group has its inhibitions, and its assertions that residence in hall prolongs adolescence and that such students are subsidized at the expense of other students could be challenged. The final section, however, with its emphatic recommendation that a comprehensive further education service should be established, is altogether admirable. Such a service should envisage the amalgamation of the youth employment and youth services, and the group suggests that the county colleges, for which provision was made in the 1944 Act, would constitute the natural headquarters, offering membership to every youth not otherwise enrolled in an institution of full-time further education. There would also be close links with the colleges of liberal arts and technology and with the extra-mural departments of the universities.

It is perhaps for this recognition that any sound policy must treat higher education as a whole and that its development must equally be planned in relation to secondary education and indeed primary education that the paper is most important. The paragraph in the Queen's speech dealing with education indeed referred to the schools as well as to technical colleges and universities, and at least implied that the supply of teachers is a common problem. A specific reference to the reduction in the size of classes might suggest that this is a priority in the Government's policy; but nothing was said in the debate on the Queen's speech to indicate that the independent investigations are already in train upon the results of which the priorities should be based. References to education in the House of Commons debate related mainly to the youth service and to the modernization of school buildings, and in replying on a debate which had been concerned mainly with the youth service, the Minister of Education, Sir David Eccles, conceded that in the last Parliament technical education had received the greatest attention. He said it is now time to give greater attention to the needs of the fifteen- to eighteen-year-olds, especially in leisure and in non-vocational education.

Sir David pointed out that this in itself brings us back to the primary schools and that we are concerned with the needs of some 7 million children and 300,000 teachers in all sorts of schools and colleges. The Government is fully determined, he said, to make a major advance in the youth services and the leisure activities of young people; but he gave no indication of either the magnitude of the effort or how the priorities are to be assessed.

Although education received rather less attention in the debate on the Queen's address in the House of Lords, the Earl of Home in a reply for the Government was a little more forthcoming. He welcomed Lord Rea's reference to our need to equip the young to meet the intellectual, physical and moral challenge of the time and, while admitting that the expansion contemplated for the universities and the technical colleges would strain our resources, agreed that it nevertheless must be made. Education, however, must look beyond technology, and Lord Home agreed with Lord Hastings on the need for constructive and imaginative thinking if the right solution to our problem is to be found. The mere expenditure of £700 million, a figure expected to rise for England and Scotland to £1,000 million a year by the early 1960's, is improbable of itself to suffice. We are unlikely ever to have the resources to do what is desirable at any one time. The selection of priorities is unavoidable, and what matters is that the right priorities should be chosen.

"A Policy for Higher Education" challenges the critical thinking and inquiry which should precede the choice of priorities and which should indicate the right priorities. Its main emphasis is on higher education, but not on higher education without regard to the needs of secondary education or of further education in the more general sense. The need for balance is recognized, and the discussion which it seeks to provoke should elucidate some of these issues and may even stimulate the impartial inquiry that is needed to collect the facts on which decisions should be based. Not least, apart from re-examination of the inter-relations between school and university, the paper should stimulate some fresh thought about the extra-mural work of the universities and their regional responsibilities.

MAGNETOHYDRODYNAMICS

Cosmic Electrodynamics

By Dr. J. W. Dungey. (Cambridge Monographs on Mechanics and Applied Mathematics.) Pp. ix+183. (Cambridge: At the University Press, 1958.) 32s. 6d. net.

A DECADE has elapsed since the publication of Alfvén's book, "Cosmical Electrodynamics"—a subject which was then beginning to attract the attention of the scientific world. Since then, the new science, now generally called 'magnetohydrodynamics', has grown in importance and interest and there exists to-day a vast literature on the subject—a fact which must be particularly gratifying to its originator The book under review, bearing almost the same title as Alfvén's book, gives some indication of the progress and of the consolidation which have been achieved in this field during the intervening decade , and while Alfvén inevitably confined himself for the most part to his own pioneer researches, Dungey has cast his net wider and, as was to be expected, his approach is more sophisticated

The book effectively consists of two parts, although the author makes no such division The first part deals with magnetomechanics proper, and some interesting causal general relationships are discussed at length Certain pitfalls which abound in this subject are pointed out—notably the fallacies into which one may be drawn by an injudicious application of the orbital motions of an isolated charged particle in a magnetic field to the behaviour of an ionized gas in a magnetic field

The second part of the book is concerned with applications to solar and terrestrial magnetism (mainly magnetic storms and aurorae), ionospheric electrodynamics and the author's own discharge theory of solar flares

There can be no doubt that the author has given an admirable synthesis of the subject The mutual interaction of the mechanical forces and the electromagnetic forces in a conducting fluid moving in a magnetic field is fully and clearly discussed, and attention is given to the important problem of the stability of twisted magnetic fields

One of the more important problems in that field, the stability of plasma equilibrium configurations, which has figured prominently in recent years in connexion with the problem of controlled thermonuclear reactions, is here discussed by the author mainly from the point of view of astrophysical applications Nevertheless, some attempt is made to discuss the problem more generally in the chapter on magnetodynamics under the section on small oscillations Brief references are also made to hydromagnetic shock waves and hydromagnetic turbulence

There is an admirable account of solar phenomena, including granulations, sunspots surface magnetic fields, prominences, flares and *M*-regions But the author seems to have been reluctant to supplement this by a more extensive account of current theories of sunspot magnetic fields , and the dynamo theory of the origin of the geomagnetic field is not treated as fully as one might have expected

The chapter on magnetic storms and aurorae, one of the most successful in the book, contains a fairly complete account of one of the current theories of these phenomena It is a pity that the author has not seen fit to make some reference to the theories developed by Alfvén and Singer, probably because Alfvén himself has given a full account of his theory in his own book Both theories contain many fruitful ideas, and the recently discovered Van Allen trapped-particle radiation appears to have been uncannily prophesied in Singer's work

There are few errors in this book , in the opinion of the reviewer it gives one of the most comprehensive and accurate accounts of magnetohydrodynamics yet published It is admirably constructed, and though it is not an easy book to read, the reader will nevertheless be amply rewarded by the many interesting and stimulating ideas he will find in it , it should be read by everyone interested in the subject

DEVELOPMENT OF NUCLEAR POWER

The Economics of Nuclear Power, including Administration and Law

Vol 2 Edited by I R Maxwell, P W Mummery and Philip Sporn (Progress in Nuclear Energy, Series 8) Pp vi+419+xii (London and New York Pergamon Press, 1959) 105*s* net

Partnership for Progress International Technical Co-operation

Being the *Annals of the American Academy of Political and Social Science* (May 1959)

THE fifth annual report of the United Kingdom Atomic Energy Authority referred particularly to the need to relate plans for the development of reactors to the possibilities of the export market and pointed out that, although much of the Authority's work on the larger systems will have application to small reactors, considerable advances will be required in nuclear technology before reactors of the range 20–100 MW become competitive in normal circumstances It is in this context that a number of the papers contributed to the second International Conference on the Peaceful Uses of Atomic Energy which have now been published are of some general interest Some of those dealing with the economics of the generation of nuclear power, like those of J A Jukes on the economics of nuclear power, of J C Duckworth and C Hywel Jones on economic aspects of the United Kingdom nuclear power programme, have in a few points been modified by statements in Parliament or elsewhere

Three papers offer an important contribution to the discussions of power problems in the undeveloped countries Two of these are concerned with the world demand for nuclear energy in the first, K M Mayer reviews the economic setting for nuclear power and heat development, and in the second, Dr H J Bhabha discusses the need for atomic energy in the under-developed countries With N B Prasad he also surveys the contribution of atomic energy to a power programme in India Besides these, the Atomic Energy Commission of Japan describes the long-term plan for the development of atomic power reactors in Japan authorized in 1957

This plan emphasizes the large number of scientists and engineers required for technical research on and the manufacture of reactors, fuel elements and related equipment, and recognizes that there is a scarcity of such men throughout the world With this difficulty Dr Bhabha does not appear to be concerned, and to him the problem is one rather of economics and capital investment It is probable, however, that the question of scientific and technical man-power, and the related one also recognized by the Atomic Energy Commission of Japan of a national industrial structure which permits efficient and easy assimilation of nuclear reactors and equipment, are far more important than finance It is at least clear that the effective exchange of information and scientists and the establishment of close international co-operation, of which the Geneva Conference and the publication of its edited proceedings is an outstanding example, are essential factors in all such developments

The development of nuclear power more especiall in the under-developed or less advanced indus countries is, however, only a particular exa international technical co-operation, an

1959 issue of the *Annals of the American Academy of Political and Social Science* devoted to that theme should be of even wider interest It shows the perspective in which technical co-operation is seen by Americans whether from the Congress end or from within a particular mission The characteristic approaches of the United Nations Expended Programme and of the United States Point Four Programme are next outlined and then the less well-known bilateral approach of the Sino-Soviet Bloc technical assistance

The bulk of the Symposium, however, is concerned with problems of administration, and these are illustrated finally by descriptions of three programmes the United Nations programme in Brazil , the United States operations mission in Iraq , and the Ford Foundation programme in Pakistan The problem of finance is not ignored and Dr L K Caldwell deals imaginatively with the role of the technical expert, as does Mr R W Jones with the problem of personnel management in this field Constructive suggestions are to be found in the papers by P M Glick on the choice of instruments for technical co-operation, by H Reining on the Government contract as an administrative device, and by G W Lawson on technical co-operation for administrative improvement By and large the papers cover from an American angle ground already traversed by Political and Economic Planning, and while they do not offer much in the way of new proposals they show the extent to which there is common ground in much progressive thought in this field, some directions in which further study and creative thought are needed and the magnitude of the effort which is already being made, to which in a special field some of those papers contributed at the Geneva Conference on the Peaceful Uses of Atomic Energy also testify

R BRIGHTMAN

ROCHESTER CONFERENCE ON SEMICONDUCTORS

Advances in Semi-Conductor Science

Proceedings of the Third International Conference on Semi-Conductors, held at the University of Rochester, U S A , August 18–22, 1958 Edited by H Brooks (International Series of Monographs on Semiconductors) Pp ix+553 (London and New York Pergamon Press, 1959) 100*s* net

THE report of a conference can unfortunately be little more than a collection of papers which could have appeared several months earlier, distributed among a handful of journals, and can be devoid of any of the spontaneous interchange of ideas which a conference should promote That of the Rochester conference on semiconductors does, however, include summaries of the discussions concluding each session, a review by J Bardeen of the trends in semiconductor research emphasized by the conference, and five excellent descriptive summaries by H Brooks, D Polder, L Apker, W H Brattain and C Herring Although the conference was nominally as international as those previously held at Reading, Amsterdam and Garmisch-Partenkirchen on the same subject, it was in fact dominated by American contributions and participation , but the importance which has long been attached to the subject by American defence departments, industry and universities assured an excellent array of papers, even though none seems destined to alter profoundly the course of the subject

The exciton was given much attention Broser, who had, two years previously, invoked exciton diffusion to account for the propagation of photoconductivity in some semiconductors, now considered that photon emission, scattering and reabsorption better explained the findings of further experiments His earlier co-worker, Balkanski, on the other hand, did not reject the idea that excitons could have large diffusion lengths Much interest was aroused by reports on clean surfaces of semiconductors (freshly cleaved or cleaned by bombardment), which require vacua of the highest order for their examination At the same time, the practical importance of real surfaces was reflected in the continued efforts to find a model which explains the dependence of the surface electrical properties on the bulk properties, preparation and environment Compound semiconductors, though not ignored, did not play a leading part , further physical investigations of some probably await a tenfold reduction in the content of the residual impurities Hot carriers figured prominently in a session on transport phenomena, but the avalanche effect and tunnelling, which has more recently opened up a new field of application of degenerate semiconductors, were not mentioned

If the report lacks a few outstanding papers, it none the less shows that further conferences can be held on this subject , the scope may have to be limited, however, if both the conferences and their reports are not to be unwieldy J R TILLMAN

ENGINEERING STATICS

Elements of Engineering Statics

By Prof H Deresiewicz Pp vi+124 (New York Columbia University Press , London Oxford University Press, 1958) 28*s* net

STATICS has gained importance in engineering science because, together with the geometry of deformation, it forms the basis of structural analysis generally However, owing to the apparent requirements of engineering practice over the past 100 years, a variety of set procedures for the analysis of structures has been developed, using the principles of statics and geometry and the assumption of elastic behaviour Accordingly, text-books on theory of structures have tended to be concerned more with the details of these procedures, or so-called methods of analysis, than with general principles This has led to some confusion and misapplication of principles as well as failure to adopt a rational and discriminating approach to structural analysis Thus, even in published work, the so-called principle of least work, due to Castigliano (1873), has been regarded as an application of the statical principle of minimum potential energy While the former is concerned with the compatibility of deformations within statically indeterminate structures the elasticity of which is linear, the latter is concerned with the stable equilibrium of conservative statical systems generally

Having regard to this background, a book of the kind written by Prof Deresiewicz, which presents the principles of statics in relation to the requirements of engineering science, is welcome indeed It contains chapters on the elements of vector algebra, equilibrium including consideration of statical determimacy, equivalence of force systems, simple structures, sliding friction, work and energy methods and equilibrium of space systems Chapter 7, on work and energy methods, is particularly important as an introduction to energy principles and their power as analytical devices, and should serve to prevent the kind of confusion to which reference is made above Thus, sections on real and virtual work, potential energy and stability are included in this chapter

Another important feature of the book is the large number of worked examples which it contains and the appended selection of examples for solution, with answers It is to be hoped that this book attracts the attention of teachers and students and that, together with similar works in the future, it will lead to more advanced courses in applied statics to supplement those in techniques of structural analysis

T M Charlton

GRASSLAND MANAGEMENT

Grass Productivity

By André Voisin Translated from the French by Catherine T M Herriot Conversion of Tables by M M Sandilands Pp xiv+353+41 photographs (London Crosby Lockwood and Son, Ltd , 1959) 50s net

This book by André Voisin is timely if only for the influence it may have in re-stressing the importance of exploiting pasture by better grassland management practices M Voisin is a scientist who became a practical farmer , he farms a sixty-acre dairy farm wholly in grass in the Department of Seine Inférieure near Dieppe He has clearly given much thought to the problems of growing grass and of using it intensively by means of his dairy herd He is an enthusiast particularly in respect of the health of his animals and as a farmer is much concerned with high yields, attaining thereby a satisfactory economic return He regards the process of grazing as the "meeting of cow and grass" and throughout his book indicates the importance of this concept by laying emphasis on the facts that the yield from grazed pasture enormously depends upon the way animals are put to graze it, and also on when they graze in relation to the physiological growth of the herbage offered them

High quality and maximum yields from pasture lands in France, as in Britain, come about as a result of good farming practices and one feature of these is the part which animals play in maintaining the botanical balance between species in the pasture It is by no means certain, however, that the animal is an essential ingredient of the 'high-production pasture complex' Indeed, many pasture fields in Alpine Europe are highly productive by any modern standard and yet are seldom grazed by animals The recent interest in so-called 'zero grazing' and the nineteenth century vogue for 'soiling' in Britain involve periodic harvests of herbage and feeding it immediately to animals living away from the field on which it is grown The success of all these schemes depends upon maintaining rapid growth and high levels of herbage yields by fertilizer (including dung and urine) applications to the pasture fields Given these conditions there need be no difficulty in maintaining either immediate yield or balance of botanical constituents upon which continued productivity depends Success as a viable economic process depends much also upon the input of labour and machinery in relation to net output of animal product, compared with other systems of utilization

M Voisin attempts to describe in some detail the mechanism of grazing and perhaps draws too large a distinction between normal grazing by the cow and harvesting by machine Undoubtedly there are differences between these two mechanisms, but it is dangerous to over-stress the differences out of context It may be that the mechanics *per se* of grazing are no more important than is the fact that animals deposit dung and urine on the land from which they graze, and thereby return plant nutrients into circulation and so accelerate the rate of turnover of nutrients within the plant/animal/soil system M Voisin makes much of the concept that "cows refuse to work any hours of overtime" The suggestion that grazing animals feed when at pasture for strictly eight hours a day is based on quite fragmentary evidence In fact there are a number of records in the literature which show that in many circumstances the ruminant will actively graze for many more hours a day than the stipulated 'union rate' of eight hours

The book is excellently produced and the English translation done well, although a number of errors occur in the text Some of these are almost certainly due to translation and can be eliminated in a second edition There is also a good deal of repetition which is possibly more obvious in the English text than in the original M Voisin's book, however, should prove a useful addition to the library of any thinking husbandryman

W Davies

HUMANE EXPERIMENTS

The Principles of Humane Experimental Technique

By Dr W M S Russell and R. L Burch Pp xiv+238 (London . Methuen and Co , Ltd , 1959) 30s net

Experiments on living animals present a number of difficulties Individual animals differ from one another in their responses, so it is usual to make numerous replicate observations as a basis for reliable predictions Animals are sensitive to small changes of many kinds in their environment, and this sensitivity can affect an animal so that it reacts differently to the same experimental stimulus on different occasions The more disrupting the stimulation, the more violent the reactions of the animal and the more inconsistent its response These are also the circumstances in which the animal is in all probability distressed or in pain The various responses which are associated with distress and pain, and which help the animal to overcome or escape from injury greatly complicate any study of the direct response to the initial stimulation, and so are usually undesirable from the scientific as well as the humane aspect Every step which can be taken to reduce the complexity of an animal's response will reduce also the experimental variation, and so there is good reason for considering humanity and experimental design as one problem

It is both humane and economical also to use as few animals as possible in experiments However, it is rather difficult to know to what extent Britain the use of animals is minimized The f available from the Home Office returns detailed enough to be informative More extensive information was obtained in a survey conducted by the Laboratory Animals Bureau in 1952 This survey depended on the voluntary co-operation of the relevant laboratories, but as about 80 per cent replied, the results are reasonably representative The material has already been analysed by Lane-Petter with particular reference to the procurement of experimental animals, and it is now analysed again in this book by Russell and Burch from the point of view of their use

It must be admitted that it is a rather incoherent body of data and its defects are indicated (as Dr Russell admits) when 108 canaries of Lane-Petter's report reappear in the present analysis as 72 ducks However, it is the best available, and its inadequacy suggests that the best and most economical use of animal resources does not receive as much attention as it deserves The rest of the book deals with this problem in terms of replacement of the whole animal by a physical or chemical system, a tissue culture, or a preparation of an isolated organ , reduction of the numbers needed by avoiding quantal observations and other extravagant designs and by good environmental control, and refinement of technique in choosing suitable species, responses and methods of approaching a problem

All these approaches are desirable and useful, but must be considered in the light of the particular problem which it is necessary to solve experimentally It is useful to have a résumé of ways which have already been adopted to make experimentation as humane as possible, and so this book is in some ways supplementary to the well-known UFAW handbook on the care of laboratory animals It is not sufficiently informative to be used as a guide either to details of experimental design or to the husbandry of experimental animals Perhaps its chief purpose is to stimulate thought on both these topics, and it is to be hoped that it will succeed in doing so

M Weatherall

U.S. ARMY NEUROSURGERY IN THE SECOND WORLD WAR

Surgery in World War II Neurosurgery, Vol I
Colonel John Boyd Coates, Jr , M C , Editor in Chief (Medical Department, United States Army) Prepared and published under the direction of Major General S B Hays Pp xix+466 (Washington, D C Government Printing Office, 1958) 5 dollars

A HISTORY of surgery in the Second World War is in course of preparation by the Medical Department of the United States Army Two volumes are devoted to neurosurgery The first of these has been published and deals with the organization of the neurosurgical services and the care of head injuries at all stages after wounding The second volume will deal with spinal and peripheral nerve injuries

The first volume is edited by Drs R G Spurling and Barnes Woodhall, contains 466 pages, and is beautifully produced and illustrated Although fourteen authors have contributed sections, there is little overlap between these, and the quality of almost every section is extremely high The early chapters are concerned with the planning and development of neurosurgical services in the United States itself, and the European and Mediterranean theatres, and reveal what can be achieved by excellent organization Thus the nine neurosurgical centres set up in the United States in August 1942, each with 150 beds, had increased in two years to nineteen, each with 350–500 beds, and within another year certain of these hospitals had 2,000 beds Although a programme of training for military neurosurgeons was instituted early in the War, it is no surprise to hear that it was at times difficult to find what was considered to be the appropriate medical personnel for these numerous centres, in particular at the ward officer level When the demand for neurosurgeons overseas developed, the problem of distribution of personnel was at times difficult The assistance of organic neurologists would have been invaluable but their scarcity in comparison with neuropsychiatrists rendered such aid quite infrequent The contributions of the consultant neurosurgeons in disseminating knowledge through visits, news-letters and conferences were invaluable In all theatres of operations it was believed that neurosurgeons could be most profitably employed in evacuation hospitals 15–20 miles from the front, the patients being transferred to neurosurgical centres some days later

The greater part of the volume is given over to the consideration of therapy in the head injuries of modern warfare, and contains several outstanding contributions In one of these the modern management of missile wounds of the head receives detailed consideration. The post-operative fatality rate in several groups of patients treated by such techniques was approximately 14 per cent, another 12 per cent of the patients reaching hospital after a head injury dying without treatment These figures give eloquent testimony to the success of the plans for treating neurosurgical casualties and the skill of those who carried them out

Another excellent contribution deals with post-traumatic epilepsy Almost 250 patients were submitted to a carefully planned study In 55 per cent, seizures were controlled medically for a minimum period of four months , 17 per cent were lost to the investigation and in 28 per cent the attacks remained uncontrolled Two-thirds of the latter group of 66 patients were treated surgically From the early results it is considered that surgical measures may have a limited place in the management of post-traumatic epilepsy which does not respond to medical measures

Other articles deal with pathological aspects of missile wounds, blast concussion, infective complications of brain wounds and ventricular penetration by missiles, as well as the repair of skull defects Perhaps the only omission is a discussion of the rehabilitation and resettlement of patients with brain wounds Such a section would have completed the story of the group of patients so fully considered from other points of view

This contribution to the history of surgery in the United States Army in the Second World War is a very valuable one It is a fascinating account of the development of the Army neurosurgical services and their utilization during the greatest of wars Moreover, it provides in readily available form detailed information which will be invaluable to those concerned in the development of a military neurosurgical service in the future, should the need for this arise

J E A O'Connell

Précis de Pétrographie

Roches Sédimentaires, Métamorphiques et Éruptives Par Prof Jean Jung Pp 314+20 planches (Paris Masson et Cie, 1958) Broché, 3,600 francs , Cartonné toile, 4,600 francs

TO Prof Jung, petrography and petrology are ill-separated, and in this book he considers not only the descriptions of different sorts of rocks in thin section but also their mutual relations and origins The book is intended as an introduction to the science of rocks for students engaged on degree courses, and it is an admirable introduction, concise and essentially complete There are, however, no references or bibliographies, which may be considered a drawback in a work which is so condensed It is organized in four sections, the first on rock-forming minerals, the second on sedimentary and residual rocks, the third on metamorphic rocks, and the fourth on igneous rocks, each of which is copiously illustrated with excellent line drawings and photographs

An early chapter contains one of the most compact, readable, logical, and memorable expositions of the structure of the silicates to be found in any text-book, and sets the tone for the rest of the book The clarity of the writing is such that very modest linguistic ability, aided by a good dictionary, is sufficient to make the text easily intelligible Even so, it is probable that the majority of English-speaking students will not wish to add translation to the other burdens involved in mastering a new subject, and possibly the greatest value of the "Précis de Pétrographie" outside the French-speaking world will be to more advanced students, who will find in it a rapid means of verifying the systems of rock nomenclature and classification in use in France, together with the accepted views on petrology current there

J C. M Taylor

The Physics of Elementary Particles

By Prof J D Jackson (Investigations in Physics, No 9) Pp x+135 (Princeton, N J Princeton University Press , London Oxford University Press, 1958) 30*s* net

THIS book gives a simple and readable account of the main features of elementary particles and their interactions other than the electrodynamic interaction of photons with electrons and positrons

The first part of the book deals with pi-mesons and nucleons, particularly pion-nucleon scattering and photo-pion production These processes are treated from a semi-classical point of view, but an outline is also given of the dispersion relation approach to scattering The determination of the spin and parity of the pions is not discussed, which is a pity, as a few extra pages would have added greatly to the completeness of the picture

The next section gives the basic facts about *k*-mesons and hyperons, introduces the concept of 'strangeness' and distinguishes clearly between strong and weak interactions

The last part of the book describes the weak interactions, including a discussion of space and time reflexion, and charge conjugation invariance The final sections review the experimental determination of the β-decay interaction and discuss the universal Fermi interaction

In his preface the author wisely remarks "In a field of physics that is changing every instant it is senseless to hope that a book written to-day will endure beyond to-morrow, but I hope that this volume will serve for a short time as a useful introduction to a fascinating subject" He has succeeded admirably in this limited objective

Analytical Chemistry

Some New Techniques By A G Jones. Pp viii+268 (London Butterworths Scientific Publications , New York Academic Press, Inc , 1959) 40*s*

IN this useful book, several of the more recent techniques of analytical chemistry are described Larger texts, mainly American, have appeared which cover similar ground, but these have generally been designed for advanced student training The book under review is aimed at senior chemists who have little time to delve into the original literature and who want a succinct account of a new technique

The methods which have been chosen are flame photometry, differential spectrophotometry, gas chromatography, ion exchangers, acid-base titrations in non-aqueous media, coulometric titrations, differential refractometry and the determination of oxygen and hydrogen in metals In each section, the principles of the method are delineated, the essential apparatus is described and the applications are discussed A broad idea of the possibilities of each technique is given and, just as important, its limitations are mentioned , the reader is warned of the most likely sources of error A number of references is given to more detailed texts and to the original literature

The section on the determination of oxygen and hydrogen in metals is devoted to the analysis of the one-time rarer metals , most of the actual techniques in this part have been used for years in the iron and steel industry, but their broader application is quite recent and has involved special problems

In general, this little book serves its purpose admirably and should be welcomed as a simple exposition of several very valuable techniques

A M G Macdonald

Mites, or the Acari

By T E Hughes Pp vii+225 (London The Athlone Press, University of London, 1959 Distributed by Constable and Co., Ltd) 42*s* net

IT is surprising in view of the economic importance of mites and ticks that this should be the first comprehensive account of their biology and anatomy to be published in Britain Mr Hughes's text can be considered in two sections In Chapters 1–6 an account is given of the biology of both free-living and parasitic species, while Chapters 7–14 deal with their anatomy The formidable task of gathering biological information from a scattered literature and presenting a readable survey has been well done, although it is unfortunate that a number of errors have escaped the author's notice For example, it is incorrectly implied that the Bdellidae are exclusively littoral and that the Rhodacaridae prefer saturated conditions The second section is more authoritative The discussion of the external and internal anatomy of the Acari is based on a critical review of evidence, a considerable amount of which has been derived from the author's own researches. The outline classification presented in the final chapter should prove useful to the general zoologist The book is well produced and the text-figures are of high standard throughout

GAMMA-RADIATION FROM DEPOSITED FALL-OUT

By D. H. PEIRSON and L SALMON

Health Physics Division, Atomic Energy Research Establishment, Harwell

THE rate of deposition of fission products from nuclear test explosions has increased since 1957 This increase is shown, for example, in the annual deposition of strontium-90 observed[1,2] in rainfall at Milford Haven, Pembrokeshire

Table 1

Year	Deposition of strontium-90 (mc /km ^{2})
1952–54	2 0
1955	2 4
1956	2 5
1957	2 6
1958	5 4

About two-thirds of the deposition in the United Kingdom during 1959 is produced by the explosions of autumn 1958 This is deduced from measurements of the strontium-89/90 ratio in rainwater and similar data from dust samples from the atmosphere Therefore, not only has the rate of fall-out increased but it also follows that current deposition contains a large proportion of fission products of half-lives shorter than those of strontium-90 (28 years) and cæsium-137 (30 years), which are considered to have the greatest long-term radiological significance It is instructive to consider the increase of external gamma-radiation due to the deposition of the short-lived fission products

Analysis of Soil

The increase in gamma-radiation has been analysed by assaying samples of soil and grass from several sites in the United Kingdom

Samples of undisturbed topsoil, including vegetation and root-mat, are cut in dimensions 15 cm × 15 cm × 7 cm deep Each sample is thoroughly mixed and counted in bulk ($\sim$ 1 kgm) by a gamma-ray scintillation spectrometer, containing a sodium iodide crystal (7 5 cm × 7 5 cm diameter) shielded by 10 cm of lead and coupled to a multi-channel pulse analyser The gamma-ray spectrum of the deposited fission products lies superimposed upon that of the natural radioactivity of the soil, namely, the uranium and thorium series and potassium The spectrum of natural radioactivity is measured at each site in a second sample cut from immediately beneath the first Comparison of the spectra from the two samples allows the contribution due to fission products to be extracted from the composite picture, since in all cases it is found that at least 95 per cent of the deposited fall-out is confined to the top 7 cm of soil

The principal fission products that have been assayed by this means in recent soil samples are shown in Table 2

Parent and daughter activities are bracketed in this table Half-lives and gamma-ray energies are available from Strominger *et al* [3]

Table 2

Fission product	Gama-ray energy (MeV)	Half-life
Cæsium-137	—	30 year
(Barium-137*m*)	0 661	2 6 min
Zirconium-95	0 72, 0 76	65 day
Niobium-95	0 77	35 day
Ruthenium-103	0 50	42 day
Ruthenium-106	—	1 year
Rhodium-106	0 51	30 sec
Cerium-141	0 145	33 day
Cerium-144	0 134	290 day

The results of soil assays at seven sites are summarized in Table 3

Apart from the case of cæsium-137 the significant gamma-ray activities in the soil samples arise from combinations of pairs of fission products The genetic relationship between zirconium-95 and niobium-95 permits calculation of the contribution from each, assuming the pair to be in transient equilibrium No such relationship exists in the other pairs, so to avoid the uncertain conversion to beta-disintegrations, the surface concentrations of deposited fission products are expressed as mc /km ^{2} of the appropriate gamma-disintegrations An additional component observed in the spectra of most samples, but not listed in the table, has been attributed to zinc-65 (245 days) The contribution of this isotope to the total activity is insignificant

Continuing deposition will increase and radioactive decay will decrease the content of any radionuclide Since collection of the soil samples was extended over a period of three months, the activity of the short-lived gamma-ray emitters at the various sites should be compared in the light of these factors The small contributions from cerium-141, -144, ruthenium-103 and rhodium-106 are a result of low yield per fission, low gamma-ray abundance per disintegration or previous decay The activity of cæsium-137 represents an accumulation from explosions over some years, whereas that of zirconium-95–niobium-95 originates from the most recent series of tests

Soil samples from Illinois in 1957 were analysed in a similar manner by Gustafson *et al* [4]

Cumulative Deposition in Rain

The relationship between the surface concentration of cæsium-137 and mean annual rainfall is demonstrated in Fig 1

The concentrations of activity due to cæsium-137 and zirconium-95–niobium-95 at Milford Haven may be derived in another way by calculating the cumulative deposition, corrected for decay, in rainwater These are plotted in Fig 2 The activity of cæsium-137 was obtained from published deposition data[1,2] Measurement of the deposition at Milford Haven of zirconium-95–niobium-95 (unpublished) started only in August 1957 An approximate

Table 3

Site and date	Cerium-141, -144		Ruthenium 103, Rhodium-106		Cæsium-137		Zirconium-95–Niobium-95		Total
	mc γ/km ^{2}	μr /hr	mc γ/km ^{2}	μr /hr	mc γ/km ^{2}	μr /hr	mc γ/km ^{2}	μr /hr	μr /hr
Kew (Surrey) 26 8 59			8	0 07	13	0 15	34	0 44	0 7
Chilton (Berks) 3 6 59			34	0 30	22	0 25	158	2 05	2 6
Abingdon (Berks) 25 6 59	24	0 05	22	0 20	28	0 32	135	1 77	2 3
Milford Haven (Pembroke) 14 7 59	17	0 04	18	0 16	43	0 50	182	2 37	3 1
Eskdalemuir (Dumfries) 28 8 59	19	0 04	27	0 24	54	0 62	130	1 00	1 9
Windermere (Westmorland) 10 7 59	24	0 05	33	0 30	75	0 86	331	4 30	5 5
Snowdon (Caernarvon) 27 6 59	40	0 09	57	0 51	133	1 53	567	7 38	9 5

starting point for this curve was obtained by the somewhat crude assumption that the cumulative deposition of zirconium-95 at this date was identical with that of strontium-89 (available from ref 1) Any error due to this assumption becomes progressively less important after September 1957 on account of the radioactive decay Thus by March 1958 the initial error has been reduced to one-tenth

The calculation from cumulative deposition gives estimates of the concentrations of activity of cæsium-137 and zirconium-95 and niobium-95 at Milford Haven that are about 70 per cent of those from the soil assay The factors that might contribute to this discrepancy include non-uniformity of the site drainage, inadequacy of the sampling method and the possibility of dry deposition The analytical error, at least for the determination of cæsium-137 and zirconium-95–niobium-95, is probably not greater than 10 per cent

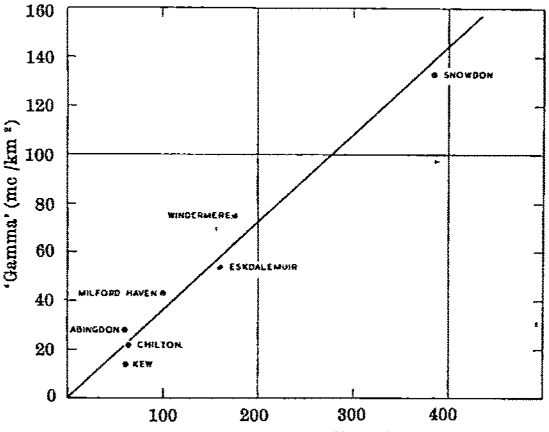

Fig 1 Cæsium-137 in soil (June–August 1959) versus rainfall

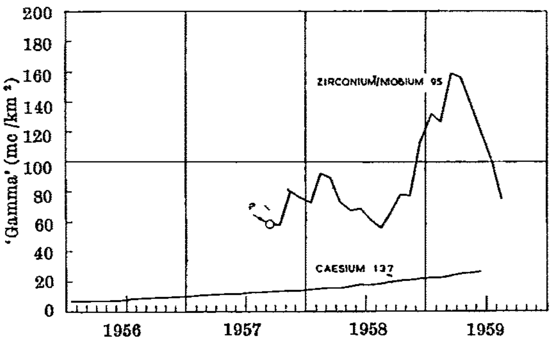

Fig 2 Cumulative deposition at Milford Haven

Gamma Radiation Dose-rate

The surface concentrations listed in Table 3 are converted to gamma-ray dose-rates by using the data of Chamberlain[5] The dose-rates at a height of 1 metre are calculated by neglecting absorption in the soil The effect of absorption is small for the freshly deposited zirconium-95–niobium-95 but may be significant for the long-lived cæsium-137 that is subject to continuous weathering

Only at the Chilton site is it possible to compare by direct measurement the gamma-radiation dose-rates due to fission product and natural radioactivity Elsewhere no measurements were made before the period of significant fall-out At Chilton the dose-rate due to natural radioactivity (excluding cosmic rays) is 5 μr /hr The increase in June 1959 due to fission product deposition is $\sim$ 50 per cent

It is clear that, during this period of soil sampling, the enhancement of gamma-radiation dose was mainly due to the fission products zirconium-95–niobium-95 Undoubtedly, if nuclear test explosions were not resumed these short-lived fission products would become insignificant compared with cæsium-137 If the production of nuclear debris continues at the rate of 1957–58 then the gamma-radiation dose from zirconium-95–niobium-95 could become a significant radiobiological hazard Thus at mean rates at Chilton corresponding to June 1959, the approximate annual dose above uncultivated land from zirconium-95–niobium-95 would be 20 mr /year and that for cæsium-137 2 mr /year, compared with about 40 mr /year from 'natural background' activity (excluding cosmic rays) At other sites having heavier rainfall and greater fall-out deposition the annual dose-rates would be correspondingly larger

The dose to the population, making allowance for weathering and shielding by buildings, has been estimated by Spiers (see following article)

SOME MEASUREMENTS OF BACKGROUND GAMMA RADIATION IN LEEDS DURING 1955–59

By Prof F W SPIERS

Department of Medical Physics, and M R C Environmental Radiation Research Group,
University of Leeds

GREAT interest centres on the extent to which the fission products from nuclear weapon tests add to the dose received by human beings from natural environmental sources The extra radiation dose is contributed both by radioactive nuclides which become incorporated in the body and by penetrating radiations from fission products deposited on the ground Estimates of the external fraction of the dose[1,2] suggest that it is smaller than that received from internal sources, but such calculations necessarily involve many assumptions , The radiation dose out-of-doors is calculated for a uniformly contaminated plane surface and assumptions are made concerning the leaching away of surface deposition by rain. In estimating the dose to the population further assumptions must be made as to the shielding afforded by houses and the fraction of the day spent out-of-doors

A number of measurements of the total γ-ray dose-rate have been made in Leeds over the years 1955–59, and these, together with other observations now reported, indicate that over undisturbed grassland a considerable increase in dose-rate has occurred Present information is insufficient to determine an over-all average increment for sitesi ndoors and out-of-doors but the increase will be much less than that over grassland , tentative estimates, however, suggest that it is probably greater than the dose-rate to body tissues from ingested cæsium-137[2]

Measured γ-ray dose-rates at points 1 ft above the centres of two small lawns in Leeds are shown in Fig 1 They have been made at varying intervals since July 1955, the first four measurements being made with Geiger counters and those since August 1, 1957, with a portable high-pressure ionization chamber The two Geiger counter measurements *C* and *D* in 1957 were standardized by comparison with the calibrated high-pressure ionization chamber , the measurements in 1955 (*A*) and 1956 (*B*), made with different counters, were each linked to those in 1957 by the γ-ray responses to a standard radium source

The high-pressure ionization chamber was used in these investigations because its sensitivity and stability of response enable the level of background gamma-radiation to be followed over a long period of time The chamber was used under drift-rate conditions and the change of potential of the central electrode was measured by applying a balancing voltage to the grid of a miniature electrometer valve in a Townsend balancing circuit Calibration was carried out in a large hall, under conditions of minimum practicable scatter, with sources of radium and iodine-131 giving known gamma-ray dose-rates[3] The final calibration figure was derived on the basis that the local gamma-radiation could be regarded as approximately equivalent in quality to a mixed radiation, in which 70 per cent of the dose-rate was attributable to radium gamma-rays and 30 per cent to iodine-131 gamma-rays[4] A drift-rate of 1 volt per min on the central electrode then corresponded to a γ-ray dose-rate of 50 3 m rad per year or 5 73 μrad per hour The stability of response of the instrument is shown in Fig 1 by the measurements made inside a heavily shielded steel cubicle where the radiation, being almost entirely cosmic, is independent of changes in the local gamma-radiation outside it The measured response in the steel room has remained throughout at 0 50 ± 0 01 volt per min when corrected for the small changes of cosmic-ray intensity with barometric pressure Corresponding to this response within the steel shield, a drift-rate of 0 7 V per min has been subtracted from the outside readings to allow for the cosmic-ray contribution

The local γ-ray dose-rate over lawn 1 (Fig 1) shows a small rise during 1955–57, but, in addition to fluctuations which include the transient effect of the Windscale reactor accident[3], there is a marked increase from the autumn of 1957 to May 1959 There are fewer observations on lawn 2, but they show a very similar rise The dotted curve in Fig 1 gives the total deposition of strontium-90 at Milford Haven[5], which provides some indication of the total deposition of long-lived fission products The surface gamma-radiation cannot be expected to follow this closely, but the increase in slope of the γ-ray curve is roughly in step with the increased deposition of strontium-90 since the beginning of 1958

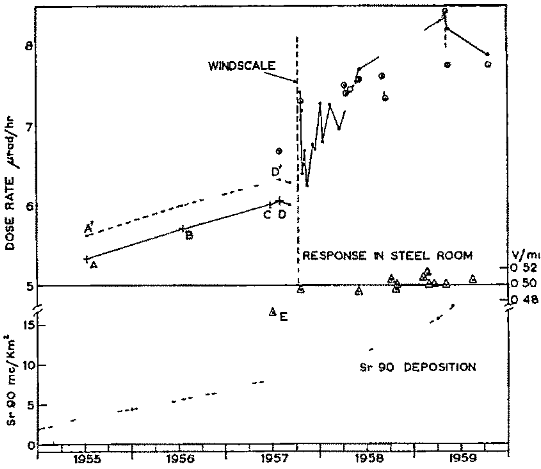

Fig 1 γ-Ray dose-rates over lawns in Leeds , the line *A' D'* indicates the revised dose-rates for *A*, *B*, *C* and *D*, if the whole of the difference between point *E* (a single observation) and the other measurements in the steel room were attributable to grid current in the electrometer valve

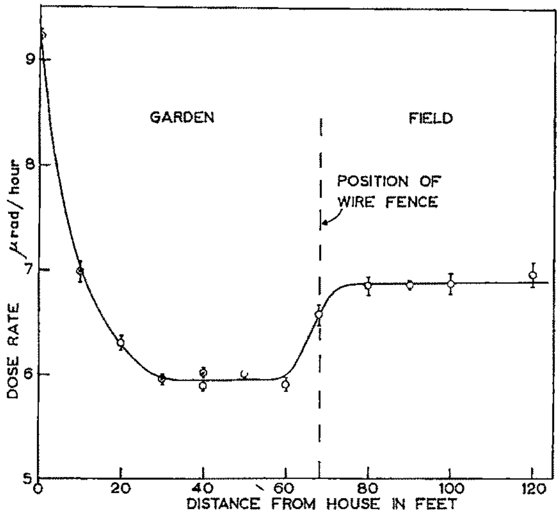

Fig 2. Dose-rates over tilled soil and permanent grassland near Leeds, June 1959 (Tilled soil was 'rotovated' in December 1958, March and May 1959)

The most recent observations recorded in Fig. 1 (October 1959) show some decrease from the high values reached in May, in accord with the decay of the deposited zirconium-95–niobium-95 fission products which contribute a large fraction of the gamma radiation. The dose-rate over lawn 1 in May 1959 was about 3 μrad per hr., or 25 m rad per annum, greater than in 1956. This measured increase can be compared with the dose-rates of 2.3–3.1 μrad per hr., calculated by Peirson and Salmon (see preceding article) from the measured amounts of fission products in the top 7 cm. of soil for sites at Chilton, Abingdon and Milford Haven. The increase in dose-rate measured at Leeds is about one-half that calculated for Windermere and one-third of that for Snowdon (Peirson and Salmon). Increments in the γ-ray dose-rate of 2.2, 1.2 and 3.1 μrad per hr. have been calculated by Gustafson[6] for the months of April, July and September 1958, respectively, on the basis of the measured fission product activity in soil at Argonne National Laboratory.

An observed difference in the γ-ray dose-rate over tilled land and permanent pasture is shown in Fig. 2. The dose-rate of 9.2 μrad per hr. near the house wall includes the contribution from the radioactivity of the brickwork, but at 40 ft. from the house the dose-rate at a height of 1 ft. is evidently representative of the activity of the surrounding land. The dose-rate over the uncut pasture is about 1 μrad per hr. greater than that over the garden, a difference which may be reasonably ascribed to burial of the fission products by mixing them to a depth of 6 in. to 9 in. by 'rotovation'. One month later, after the grass had been cut and removed, the difference between the field and the garden had fallen to about 0.5 μrad per hr. and 5 months later the dose-rates at the two sites were the same, within the error of measurement. Incidentally, at the time the hay was stacked the dose-rate near the haystack was 4 μrad per hr. above that in the open field.

The finding that radioactive deposition is located in the upper layers of undisturbed soil (Peirson and Salmon as ref. 6) is supported by some observations of the γ-ray dose-rate over a small lawn deliberately contaminated with iodine-131 at a level of 40 μc. per sq. m. This contamination produced an initial dose-rate (at 1 ft. above the lawn) of 105 μrad per hr., or about ten times the background-rate, on March 17, 1958, and the dose-rates, measured periodically over the next 45 days, are shown in Fig. 3. It was hoped that the rainfall of an English spring might provide evidence of the leaching effect of the iodine-131 from the soil. The rainfall was rather small, however, and the test fell short of its original design. It is evident from Fig. 3 that the dose-rate diminished at a rate almost equal to the iodine-131 decay rate and that the rainfalls of 1.2 in. for April and 0.7 in. for May did not appreciably affect the dose-rate by carrying the contamination to any considerable depth.

Although it is not possible to assess accurately the effect of fall-out on the external dose-rate to the population, it is useful to consider what increase in average dose-rate might be implied by the present observations on the Leeds lawns. With regard to weathering, the evidence on the deposition of fission products in the surface layers of undisturbed soil suggests that the dose-rates observed over lawns are not very much less than those to be expected if the fall-out remained without loss on the surface. An indication of the attenuation which might result from absorption of radiation, when the fall-out is distributed throughout the top 3 in. of soil, is given by observations of reduced dose-rate over snow. On two occasions in 1958, layers of snow about 4 in. deep reduced the observed dose-rates on lawn 1 to about 85 per cent of the 'unshielded' values obtained immediately after the snow melted. About the same degree of attenuation might reasonably be expected for the radiation from fission products lying at a mean depth of 1–1.5 in. The observed increase of about 25 m rad per annum in the dose-rate over lawn 1 since 1956 might be taken, therefore, to imply an increment of about 30 m rad per annum under conditions of no weathering or other removal by rain.

In deriving the population dose a factor for weathering must be introduced because washing away of fall-out is to be expected over streets and hard surfaces. Further factors for shielding when indoors must also be used. If, following the Medical Research

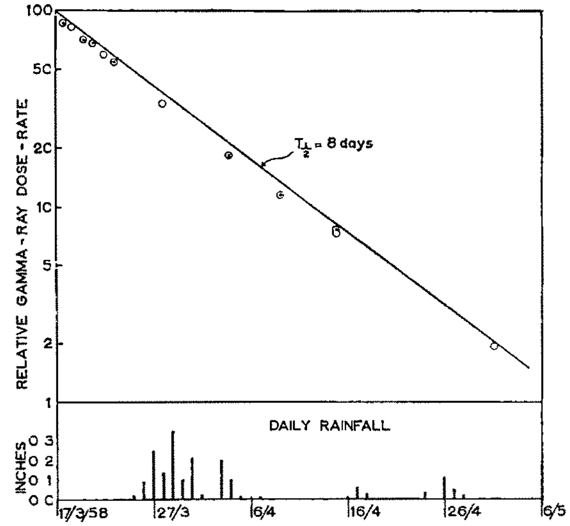

Fig 3. Decrease of dose-rate with time after deliberate contamination of a lawn with iodine-131 to produce an initial dose-rate of about ten times the background-rate, daily rainfall given in inches

Council Report of 1956[1], we assume reduction factors of 3 for weathering and 7 for shielding, and an average period of 2 5 hr a day spent in the open, the implied increase in the dose-rate to the population, above the 1956 level, would be about 2 5 m rad per year The Report of the United Nations Scientific Committee[2] discusses the range of weathering and shielding factors used by different authors and adopts a combined over-all factor of 10 On this basis, the increment of 30 m rad per annum in the uncorrected outdoor dose-rate would lead to an increase of 3 m rad per annum Because of shielding of the gonads by overlying tissues, the increment in the average gonadal dose-rate would be about two-thirds of these estimated external rates or about 2 m rad per year

There are, however, considerable uncertainties as to the values to be used as representative weathering and shielding factors and at present the limited evidence we have collected is insufficient to establish reliably the average change in the dose-rate inside houses At one site, in a ground-floor room facing lawn 1 in Leeds, an increase in dose-rate has been observed which amounts to about 80 per cent of the outdoor value After the Windscale reactor accident, the increase in this room was one-third of the outdoor value and the higher fractional increase now obtained might be taken to indicate the presence of fission products indoors In a single-story laboratory, the background dose-rate increased by 7 5 m rad per annum between October 1957 and October 1958, with a further increase of 4 m rad per annum by July 1959—increments which are about half those observed over lawn 1, but in step with them In a second-floor room in another house no significant change occurred over the period June 1958 to June 1959, during which time the dose-rate over lawn 1 increased by about 5 m rad per annum An average shielding factor for the inside of a house, which depends on the siting of rooms, door and window areas and the presence of neighbouring buildings, is difficult to assess. but it may be less than the value 7 adopted above

The present increase in the gonadal dose-rate may, therefore, be as little as 2 m rad per annum, but this estimate is likely to be low rather than high The increment, however, is greater than the values of 0 25–1 m rad per annum suggested (so far for the year 1957 only) by the United Nations Scientific Committee[2] and it is greater than the average increment in gonadal dose-rate from ingested cæsium-137 which, in 1958, amounted to approximately 1 m rad per annum[2] A probable upper limit to the dose-rate increment can be suggested if the ground-floor observations are regarded as typical of the lower range of building protection factors An average protection factor of about 2 is then implied, leading to an increment of about 4 m rad per annum, if a weathering factor of 3 is used, and about 10 m rad per annum in the unlikely event of no removal of fission products by rain It is probable that the present increment in dose-rate to the population from external fall-out is not greater than 5 m rad per annum The external contribution to the fall-out dose-rate may be expected to decrease with the decay of the zirconium–niobium fission products if no further nuclear bomb tests occur

ADDITIONS TO THE BRITISH MUSEUM (NATURAL HISTORY)

By SIR GAVIN DE BEER, F R S
Director

THE new premises recently taken into service in the Natural History Museum fall into two categories those devoted to the Museum's major task of scientific research, and those devoted to the educational function of providing exhibits illustrating various aspects of natural history and of giving instruction To the former belongs the new Mammal Building, erected to take the place of the old building demolished five years ago to make room for the new boiler house, which provides heating for the surrounding educational establishments in the South Kensington area

Built to the plans of Mr W Kendall, the new Mammal Building stands 110 ft high, consists of 11 floors, and provides 62,500 sq ft of accommodation for housing the national collections of mammals Arranged systematically on each floor, the plan adopted provides for many years of expansion and acquisition of new specimens which will take their place in the collection without the necessity for removing other portions in order to make room The importance of this provision is already seen in the efforts now being made to take advantage of the situation in Central and East Africa, where heavy casualties are inevitably being inflicted on large mammals as the result of policies that have been adopted An opportunity exists which, it is hoped, will not be missed, to collect considerable quantities of skins and skeletons of ungulates, not only because adequately documented specimens of these animals are insufficiently represented in the existing collections but also because it is becoming increasingly important to determine the range of variation of species in Nature, and this necessitates possession of large numbers of specimens

Preservation of mammalian collections presents many problems arising from the change in physical conditions of the atmosphere Research is constantly proceeding into the most effective way of preserving skins, but no amount of precautions would be of any avail unless two major variables of the atmosphere were not kept under control humidity and temperature The new Mammal Building is air-conditioned throughout to maintain the contents within prescribed limits of temperature and moisture

Provision has been made for the accommodation of scientists, both members of the staff and visitors working on the mammal collections, and laboratories have been conveniently placed on the various floors of the building where the specimens can be adequately deployed and studied

The new North Block of the Natural History Museum now accommodates the General Library and Map Room The Library of the Museum is not a public library, but the working equipment of the scientific staff of the Museum to which qualified persons, both trained scientists and students, may be admitted on recommendation The reading room, catalogue room, accessions room, studies for the librarian's staff, and book stores, conform to the most modern standards of equipment Visitors who remember the cramped quarters in which the General Library previously had to carry out its functions will be agreeably surprised at the new library

The Map or Atlas Room is a special feature of the General Library and is provided with ample accommodation for maps in shallow drawers containing a small number of maps each, so that any map can be easily and speedily extracted for study on the tables provided for their deployment Adequate facilities for pin-pointing any place on the entire map-covered surface of the globe, both on dry land and under the sea, play an essential part in the equipment of the Natural History Museum for the work of every one of its five Departments Gazetteers, books relating to topography and reports of scientific expeditions have been specially sited in the new Map Room, which also houses the large folio and double folio volumes too large for shelving elsewhere

The new facilities provided for the discharge of the educational functions of the Museum comprise fresh exhibits and a Lecture Hall

The fifth bay on the western or left side of the Central Hall of the Museum has been set up to illustrate the "Six Milestones of Evolution" These are (1) The origin of life, illustrated by means of molecular models showing Miller's experimental production of the amino-acid glycine from hydrogen, water, carbon dioxide, methane, and ammonia, by means of electrical discharges and ultra-violet light There are also models of adenosine triphosphate and of the Watson–Crick–Wilkins structure of deoxyribonucleic acid constructed on a scale of 2 cm to the angstrom unit by Mr A H Barker

(2) The origin of plants and animals, illustrating the fundamental distinction in methods of nutrition between these two types of life and its consequences An electron-microphotograph of the influenza virus by Dr R E G Wyckoff is also shown, together with examples of exceptions to the normal distinction in feeding mechanisms between plants and animals, such as parasitic plants and animals, and fungi

(3) The origin of sex, traced from the simplest form of protistan cell undergoing fission and fusion without differentiation between the sexes, up to higher plants and animals where the specialization between mobile sperm and immobile food-containing eggs is reflected in all the differences between the individuals of the two sexes

(4) The origin of the multicellular type of organization, of embryonic development, and of death form a compact subject of interrelated processes, illustrated with reference to the potential immortality of unicellular organisms, the mortality of the soma, and the development of the frog from the unicellular fertilized egg to the multicellular adult

(5) The colonization of land by plants and animals, which introduced two important biological consequences the alternation of generations in plants between gametophytes and sporophytes, and, in animals, the production of adaptations permitting eggs to be fertilized and developed out of water These are illustrated by means of models and paintings of algae, mosses, ferns, and flowering plants on one hand, and fish, amphibia, reptiles, birds' eggs, and mammals on the other

(6) Finally, under the head of psycho-social evolution, the briefest possible introduction is given to the phenomenon of non-genetically transmitted inheritance, instruction, and tradition This is illustrated by means of experiments by Dr W H Thorpe on the learning of the characteristic song by young chaffinches from adult chaffinches, pictorial representation of the customs of ancient Sparta, and of the cave art of palæolithic man, the snake of Aesculapius on a surgeon's glove, a microphone and printed page and the shadows of the Houses of Parliament and St Paul's Cathedral

The exhibits were prepared and constructed by Mr Erik Thorn

The North Hall of the Museum has been reopened and contains two sets of popular exhibits which have, unfortunately, had to be withheld from the public for some time One of these is the series of British trees, showing their appearance in summer and winter, with specimens of leaf, bark, flower, fruit and seed The other consists of the series illustrating the importance of accurate identification of organisms for the efficient control of pests, plant and animal An old friend exhibited here is the enlarged model of the flea

Of the domestic animals previously exhibited in the North Hall, the skeleton of 'Brown Jack' and the mounted skin of 'Mick the Miller' are now on view in the Mammal Balcony The remainder of the collection of domestic animals, greatly in need of augmentation, has been transferred to Tring Museum, where it is hoped at some time to establish displays of the breeds of domestic animals

From the North Hall a corridor leads to the Lecture Hall Along the corridor are showcases containing selected large mammals, such as the grey seal, reindeer lion, cheetah, leopard, jaguar, Malay tapir, yak, and two species of zebra In each case, following current museum practice, a map is provided showing the geographical distribution of the animal

Between the entrance doors of the Lecture Hall is an exhibit demonstrating steps in the mounting of mammals for exhibition prepared by Mr A G Hayward, senior taxidermist in the Museum It is sincerely to be hoped that this exacting scientific and artistic technique will never again be referred to as 'stuffing an animal' Facing the entrance to the Lecture Hall are some showcases devoted to the exhibition of notable paintings and drawings illustrating natural history

The Lecture Hall is provided with the most modern equipment for projecting slides and films, and for satisfactory acoustic conditions It accommodates 220 persons, and is used for lectures by the staff of guide-lecturers of the Museum and on other occasions

OBITUARIES

Dr D O Morgan

Dr Daniel Owen Morgan, of St Catharine's College Cambridge, and University lecturer in animal pathology, formerly senior lecturer in zoology, University of Edinburgh, died in Cambridge on November 17, aged sixty-six He was born on August 19, 1893, was educated at Tregaron County School, and after serving as a signaller during the First World War entered the University College of Wales, Aberystwyth, in 1919, reading zoology and agriculture and specializing in helminthology His postgraduate researches were conducted under the supervision of Prof R T Leiper, at the London School of Hygiene and Tropical Medicine, and included studies on the systematics of the trematode family Opisthorchidae, the bionomics of the potato eelworm *Heterodera schachtii*, and a survey of the helminths of domestic and wild animals in Hertfordshire

During the years 1923–33 he held the post of field officer and senior research assistant at the Institute of Agricultural Parasitology of the London School of Hygiene and Tropical Medicine, and during this time published twenty-three papers on parasitological subjects In 1933, he was appointed to a senior lectureship in zoology in the University of Edinburgh and became responsible for the teaching of helminthology to veterinary undergraduates reading for the Royal College of Veterinary Surgeons diploma and the University degree in veterinary science In addition, he was responsible for the postgraduate courses in helminthology for the diplomas of tropical veterinary medicine, tropical medicine and public health while during the War an emergency short course in helminthology for medical officers was his concern

Despite an extensive teaching programme he found time for research, and his outstanding contribution was the study of the helminth population of Scottish hill sheep and the discovery of the 'spring rise' phenomenon of worm egg output in these sheep His work on hill sheep has stimulated numerous researches on this and allied problems both in Great Britain and throughout the world

In 1952 he moved to Cambridge and was responsible for the course in parasitology to veterinary students He greatly loved Cambridge, its life, and was particularly fond of his College, St Catharine's He was a man of abounding kindness and encouragement, and will be remembered by the hundreds of students whom he guided and sadly missed by his colleagues

E J L Soulsby

Mr William Dallimore, I S.O , V M.H

The death of William Dallimore took place suddenly at his home near Tonbridge, Kent, on November 7, in his eighty-ninth year He entered the Royal Botanic Gardens, Kew, as a young student in 1891 and his official connexion with this institution extended over forty-five years His earlier years at Kew were spent mainly in the Arboretum, of which he later had charge It was this close association with a rich collection of living plants in his early years that enabled Dallimore, with his keen powers of observation and a good memory, to build up for himself his great knowledge of trees and shrubs which he was to put to such good effect in later years He was one of Britain's leading authorities on trees and shrubs for half a century, having maintained his keen mental powers to the full until the end of his long life He devoted special attention to the conifers, and his "Handbook of Coniferæ" (written in collaboration with the late A Bruce Jackson), which first appeared in 1923, has remained a standard work

Another of Dallimore's notable achievements was the tremendous part he played in starting and developing the National Pinetum at Bedgebury in Kent, a joint undertaking on the part of Kew and the Forestry Commission, commenced in 1925 The fine specimens of pines and other conifers now to be seen at Bedgebury constitute a fitting, living memorial to him He supervised the raising of these trees from seed in many instances One of the main thoroughfares in the Pinetum has, in fact, been named Dallimore Avenue On his retirement from Kew in 1936, Dallimore moved to Kent to live, and continued to act in an advisory capacity in connexion with Bedgebury almost to the time of his death

At Kew, Dallimore ceased to have charge of the Arboretum in 1909 when he was transferred to the Museum staff, his first task being to initiate and build up a museum of British forestry (now the Wood Museum) His knowledge of arboriculture and forestry was of great assistance to him in this He became keeper of the Museums of Economic Botany in 1926 His published works included two other books, one on pruning and one on holly, yew and box , also numerous articles in horticultural, botanical and forestry journals

The Kew Guild, an association of past and present Kew men, came into being in the early 1890's, largely as a result of Dallimore's initiative and energy He himself became president of the Kew Guild in 1926 Dallimore had other interests besides plants For many years he was an enthusiastic bowls player He was also churchwarden at the Kew parish church With his keen sense of humour and his amusing narratives he was always a popular figure His two daughters survive him

F N Howes

Mr A W. Siddons

In no subject of the curriculum has the method of teaching undergone greater change in the past fifty years than in mathematics Before the turn of the century, the school course contained little more than arithmetic, manipulative algebra and the rote learning (sometimes even in Latin) of Euclid's proofs The revolt was led by Rawdon Levett, mathematics master at King Edward's School, Birmingham, who, through a letter in *Nature* of May 26, 1870, pleaded for the formation of an Anti-Euclid Association It was left to one of his greatest pupils, Arthur Warry Siddons, to see the change effected, Euclid's stranglehold broken and geometry established as a suitable tool for school use

Mr Siddons devoted his whole life to school mathematics, though he might well have attained eminence in the university field. He was a scholar of Jesus College, Cambridge, and was fifth Wrangler in 1898, immediately below Jeans and Hardy. In the following year he read natural science, and again took a first. His only appointment was at Harrow School; here he taught mathematics with increasing brilliance and success until his retirement in 1936, and in these years he earned the affection of generations of Harrovians. In 1902 Jesus College elected him to a fellowship and, in December of the same year at the age of twenty-six, he was appointed to a University Syndicate to discuss mathematical requirements. The report stated that any geometrical proof would be accepted provided it appeared "to form part of a systematic treatment of the subject"; Levett's cherished freedom was achieved. From this time to the end of his busy life, Siddons was engaged in converting the rigid logic of mathematics into a form suitable for young minds. In this his greatest collaborator was Charles Godfrey; as a team they had the ability to put into practice their progressive ideas and, when necessary, to write the appropriate text-books.

In addition to an intensely happy family life and to his devoted service to Harrow, Siddons's great joy was his work with the Mathematical Association. In 1902 he was elected secretary of the newly formed Teaching Committee. The reports prepared by this Committee now cover the whole field of school mathematics, and in preparing many of them, Siddons (and his life-long friend, C. O. Tuckey) took a leading part. The Association recorded its gratitude by electing him as president in 1935—he was the first schoolmaster ever to achieve this distinction—and in 1958 it bestowed the rare privilege of honorary membership.

With all his ability, all this distinction, Siddons was a very simple person. He was a great conversationalist and a most lovable man; in the Harrow tradition he was very fond of singing, and the School on the Hill has cause to remember his genius as a gardener and maker of lawns. He claimed that in his school-days he found mathematics difficult; perhaps this explains his success as a teacher and his passion for simplicity within the limits of exactness. To the end his mind was crystal clear, and he died peacefully in his sleep on November 10. Those who knew him well will miss his warm friendship, and the whole body of teachers and taught in mathematics is grateful for his life and his labours.

W. J. LANGFORD

NEWS and VIEWS

International Scientific Relationships
Dr. Detlev W. Bronk, For.Mem.R.S.

A SPECIAL medal (Fig. 1) has been awarded to Dr. Detlev W. Bronk, president of the Rockefeller Institute, by the Society for Promoting International Scientific Relationships. The award has been made for Dr. Bronk's accomplishments in fostering the promotion of scientific research and international co-operation through exchanges of scholars. The medal was presented on November 24 by Dr. Herman F. Mark, honorary president of the Society and director of the Institute of Polymer Research at the Polytechnic Institute of Brooklyn. At the meeting Dr. Alan T. Waterman, director of the National Science Foundation, delivered an address on "Science and the Progress of Man".

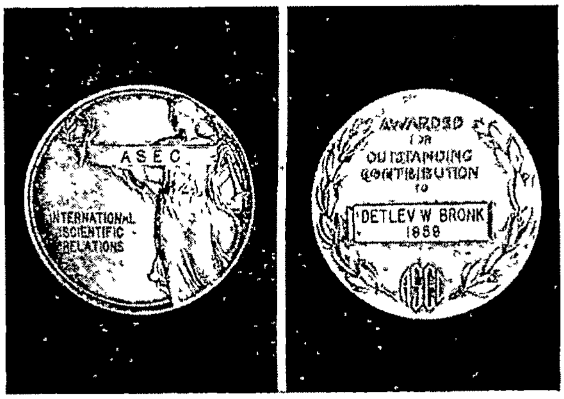

Fig. 1

Bristol City Museums Dr. F. S. Wallis

DR. F. S. WALLIS will bring to a close his long and distinguished service to the Bristol City Museums in May of next year. A Bristol man, he was educated at the Fairfield Secondary School, Bristol, and at the University of Bristol, where his academic career was broken by service in the First World War with the Royal Warwickshire Regiment and the R.F.C., later the R.A.F. He graduated with first-class honours in geology in 1920, and afterwards took his M.Sc., his Ph.D., and finally, in 1930, his D.Sc. He was appointed assistant curator in geology after his first graduation and has devoted his life to the welfare and development of the Bristol Museum and Art Gallery, of which he was promoted to be deputy director in 1930. On the division of the Museum and Art Gallery in 1945, he became director of the City Museum—now 'Museums' as they include the Blaise Castle Folk Museum. He has never forgotten his first love as he has held for more than thirty years the post of special lecturer in sedimentary petrology in the University of Bristol and has since 1936 taken the evening tutorial class in geology there. He has always been interested in adult education and has lectured extensively to members of various organizations in Bristol and the surrounding district. For his field-work he was awarded the Lyell Fund of the Geological Society. In the museums field, he has long laboured for better lay-outs, more didactic exhibits and more artistic displays, and he has not spared himself in extending good ideas and projects of reorganization throughout the museums of the south-west of Britain. He served with unassuming distinction as president of the South Western Museums and Art Galleries Association and also, in 1956, of the national body, the Museums Association, in which he now ranks as an elder statesman. He gave notable service to the Joint Committee of the Museums Association and the Carnegie United Kingdom Trustees, both as a member and for five years as its chairman, in the worthy task of allocating grants for the reorganization of smaller provincial museums. He was war-time editor of the *Museums*

Journal, which did so much to maintain standards and morale at home, to hold and strengthen links with museum men overseas, and to build soundly based plans for museums in the post-War world. It is good that he is to continue to serve his chosen profession as curator of the museum of the Torquay Natural History Society.

Mr. Alan Warhurst

MR. ALAN WARHURST, who succeeds Dr. F. S. Wallis as director of the Bristol Museums, was educated at the Canon Slade Grammar School, Bolton, and the University of Manchester, where he secured honours in history, specializing in the Roman occupation of Britain. He is particularly interested in medieval archæology in its broadest sense and has undertaken field-research in Chester, Kent and Northamptonshire, having published a number of valuable papers. During the War he saw service in India, being commissioned to the Lancashire Fusiliers. His museum service began at the Grosvenor Museum, Chester, then extended to the Maidstone Museum and Art Gallery, where he was deputy curator, and in 1955 to the Northampton Museum and Art Gallery, to which he was promoted curator. There he started a major reorganization scheme and, having completed with notable success the archæological gallery, he was about to commence the boot and shoe gallery.

U.S. Scientific Attaché in India: Prof. E. C. Watson

PROF. E. C. WATSON, dean of the faculty for the past fourteen years at the California Institute of Technology, is retiring to become scientific attaché to the U.S. Embassy in India. Dr. Watson administered the Institute's rocket development programme during the Second World War after having managed in the earlier days the Institute's physics laboratories. He has won national recognition for his studies in the history of science and for his remarkable collection of manuscripts, pictures and prints on the subject. He has published nearly eighty articles in the American *Journal of Physics* depicting the history of physics. This is in addition to numerous scientific papers and a book entitled "Mechanics, Molecular Physics, Heat and Sound". His main research has been in the field of X-ray photo electrons.

National Science Foundation: Dr. Bowen C. Dees

DR. BOWEN C. DEES has been appointed assistant director for scientific personnel and education at the U.S. National Science Foundation. Prior to going to the Foundation in 1951, Dr. Dees served as division chief and physicist with the Scientific and Technical Division of the General Headquarters of the Supreme Commander for the Allied Powers in Tokyo during 1947–51. He had previously lectured on physics at New York University, Mississippi College, the Massachusetts Institute of Technology and Rensselaer Polytechnic Institute. Dr. Dees received his A.B. from Mississippi College in 1937 and his Ph.D. from New York University in 1942.

Nomenclature in Titrimetric Analysis

DURING the Twentieth Conference of the International Union of Pure and Applied Chemistry, held in Munich in August 1959, the Committee of the Analytical Chemistry Section discussed certain points of confusion in the literature. Referring to the notation of indicators in titrimetric analysis, it was pointed out that many dyestuffs recommended as indicators in chelatometric and redox titrations have been given various trivial names. Examples can be found in the literature of a compound being recommended as a new indicator when the compound has in fact been in use for years under a different name. To avoid future confusion, the Committee recommends that when a dyestuff is proposed as an indicator in any type of titration, and particularly when it is claimed as new, the British Colour Index or Schultz Number be quoted in addition to the trivial name. As regards the terminology of complexing agents used as titrants, it is recommended that: (*a*) the group of polyamino-polycarboxylic acids which form anionic complexes shall be termed 'complexans'; (*b*) titration processes in which any type of complexing titrant is used shall be termed 'complexometric titrations'; (*c*) those complexometric titrations which involve titration with a chelating agent shall be termed 'chelatometric titrations' and represent a special type of complexometric titration.

Research Vessel for Woods Hole Oceanographic Institution

A NEW research vessel will be provided for studies in oceanography by a grant of 3,000,000 dollars from the National Science Foundation to the Woods Hole Oceanographic Institution. The new vessel will replace the research vessel *Atlantis*, the twenty-eight-year-old 'flagship' of the Institution's fleet. Because of the probability that the National Science Foundation would be asked to support the construction of research vessels, it made a grant to Woods Hole in 1958 to study capabilities and preliminary designs of various sizes and types of such vessels. This study, in turn, benefited from earlier studies made by the Institution with funds provided by the Office of Naval Research. The vessel will have an overall length of 175 ft., beam of 36 ft., and loaded displacement of 1,040 tons. She will have an operating range of 7,500 miles at a cruising speed of 12 knots. Incorporated in the design are roll- and pitch-damping devices, wide speed control and high degree of manœuvrability, superior laboratory spaces, and excellent working facilities. Preliminary design plans were prepared for the Institution by M. Rosenblatt and Son, of New York. Additional features which have been considered for possible inclusion in the detailed plans and specifications include anti-rolling tanks, acoustical 'quietness' for studying underwater sound characteristics, a gravity laboratory, an aquarium, and ample freezer space for preserving bottom-sediment cores and biological specimens. The total complement of the ship will be 37, of whom 19 will be scientists.

Radiocarbon Dating

THE appearance of Radiocarbon Supplement Vol. 1 of the *American Journal of Science* marks an important step forward in the publication of radiocarbon dates. In the past, date lists have appeared at irregular intervals in a number of journals, making it difficult for potential users of the dates to keep themselves fully informed of all the work in this field. The dating laboratories have been well aware of this problem, but there are considerable difficulties in attempting to use any one of the existing scientific journals with a wide circulation. For this reason, the editors of the *American Journal of Science* are to be commended on this project, which provides a single, relatively inexpensive, annual publication specifically for radiocarbon dates and associated measurements.

This first volume contains thirteen date lists and one paper (Lamont VI) devoted entirely to measurements on samples of known age This aspect of radiocarbon dating research has assumed considerable importance in recent years, for it yields information on the past and present distribution of radiocarbon in the carbon exchange reservoir, and this is of particular importance when one is concerned with the attainment of the highest possible accuracy in radiocarbon dates

In addition to these contributions from dating laboratories, there is a very useful bibliography by Frederick Johnson, which gives references to all previous date lists, and a list of all laboratories known to be or to have been concerned with radiocarbon dating measurements Thirty-six laboratories are listed, and it might be wondered why only about a third of them have contributed to this new publication However, if one takes into account the fact that some have now ceased to be active in this field and that others have only recently begun operating, the response to this new project is not unsatisfactory The editors have attempted to secure a high standard of presentation by requiring contributors to adhere as closely as possible to a set style and to include much informative detail regarding each sample in addition to its laboratory number and radiocarbon age In general, the various authors have responded well to these requirements, and the standard achieved in this first volume promises well for the future The Supplement is to be published annually, in May, at Sterling Tower, Yale University, New Haven, Connecticut, subscription rate 4 50 dollars a year, Vol. 1 will be sold for 2 50 dollars until January 1, 1960

Inland Waterways in Britain

An interesting feature of the sixty-fourth annual report of the National Trust, for 1958–59 (London National Trust), which records a welcome increase in free legacies and donations, is the reference to negotiations with the British Transport Commission for the acquisition of the southern section of the Stratford-upon-Avon canal and the southern section of the Staffordshire and Worcestershire canal Since then it has been announced that, under an agreement to be approved by Parliament, the National Trust will lease the first of these canals for a trial period of five years, when it can be transferred outright or returned to the British Transport Commission. For the five years the National Trust will receive £1,500 a year from the Commission and the Trust will be able to provide in the towpath a thirteen-mile traffic-free walk through a remote and interesting countryside Unless transferred to the Trust, this canal will be abandoned (at an estimated cost of £120,000) and the pleasures of fishing and boating on it would also be lost to the community The second canal is of extreme beauty and importance and is James Brindley's earliest canal with locks The Trust already owns property on this canal at Kinver and Wightwick These transfers, which are foreshadowed in the Bowes Report on Inland Waterways, represent a new departure, both for the Trust and the Commission, and the legal and financial arrangements are not expected to be completed simply or rapidly The report pays tribute to the help given by voluntary workers in scrub clearance, but, although the membership over the past fourteen years has risen from 10,300 to 80,668, many more members are needed if membership is fairly to reflect the wide responsibilities of the Trust and to support the extension of its work.

Newspaper Trusts

In Broadsheet No 435, "The Work of Newspaper Trusts", Political and Economic Planning provides a concise account of the various newspaper trusts, their purpose and character and organization, with a view of assisting the assessment of their performance (*Planning*, 25, 24 August 1959 London Political and Economic Planning, 1959 3*s* 6*d*) The fullest accounts given are of the Scott Trust, holding all ordinary shares in the Manchester Guardian and Evening News, Ltd, and the Observer Trust, but there are also notes on the provisions in the articles of association of *The Times*, *The Economist* and *The Spectator* The Broadsheet points out that the organization of such a trust must be devised for the end to be served, and that many different methods may be adopted Too precise a definition of a trust's aims or ideals could be harmful if circumstances changed To form opinion and build good traditions and to appoint men of good sense to positions of responsibility are all that can wisely or legitimately be done to control the future A newspaper trust is a novel but long-dated attempt to keep a newspaper in conformity with an existing ideal over future generations and it is still too early to judge how far these experiments have contributed to maintain the health and standards of the Press It remains to be seen whether trusts can be more successful than other forms of proprietorship and control in preserving and developing the independence and character of a newspaper and simultaneously in achieving sufficient success to stay in business, if not to lead the field

British Museum (Natural History)

Among the more important and interesting items reported to the Trustees of the British Museum at their meeting at the British Museum (Natural History) on November 28 was that Dr G. H Francis and Dr. A J Charig had returned from their expedition to South Peru This expedition, the second from the Museum to this area, had for its objective the further study, collection and mapping of the rocks of the Province of Carabaya, in the Department of Puno, together with fossil collecting from new sites in Carabaya The mapping, field geology and detailed study of igneous rocks were in the charge of Dr. Francis, of the Department of Mineralogy, continuing the work begun on the previous expedition which he led in 1954 The fossil and anthropological collections were made by Dr Charig, of the Department of Palæontology They were assisted by Messrs S G McH Clark and B L Holt, University of Cambridge, and by Sr. H Salazar Dias, University of Arequipa. The expedition was in the field from June 1 until August 1, 1959 More than four hundred specimens of rocks and minerals were collected in the present field season The survey of the area was continued, and a substantial number of fossils were assembled In addition, the expedition brought home some anthropological material from Inca burials Mrs Rees Thomas and Lady Barlow have lent to the Museum a letter from Charles Darwin, dated July 5, 1844, asking his wife to arrange for the publication of his Essay on Transmutation of Species in the event of his death The latter has been placed on exhibition in the case of Darwin relics, now on view in the Central Hall of the Museum

Tanganyikan Stratigraphy

An authoritative and up-to-date account of the stratigraphy of Tanganyika is now available in English as a result of the work of members of the Tanganyika Geological Survey (Memoir No 1 "Summary of the Geology of Tanganyika, Part 1 Introduction and Stratigraphy", by A M Quennell, A. C. M. McKinlay, and W G Aitken, 1956 , 264 pp , The Government Printer, Dar es Salaam, 20*s*) This memoir was prepared in draft in 1956 and used as the authority for the preparation of Lexique Stratigraphic International, Vol 4, "Afrique", Fasc 8c, "Tanganyika" (1957), but has only recently become available owing to delays in publication Important revisions to the pre-Karroo stratigraphy have been made The basement complex has for some time been known to contain rocks of different origins and ages in different areas, and several attempts at subdivision have been made as the structural and metamorphic history of the country has become better known On the basis of the existing evidence, the present authors have adopted a five-fold subdivision, the systems being named in order of decreasing age the Dodoman, Nyanzian, Kavirondian, Usagaran and Ubendian, Karagwe-Ankolean, and the Bukoban Systems The Dodoman System is correlated with the oldest known rocks of Africa, and the uppermost Bukoban is thought to be possibly Eocambrian

The Institute of Metals

The following members have been elected to fill vacancies on the Council of the Institute of Metals with effect from the annual general meeting on March 29, 1960 *President*, Sir Ronald Prain, chairman and president, Rhodesian Selection Trust, Ltd , *Vice-Presidents*, Dr. H M Finniston, research manager, C A Parsons and Sons, Ltd , and H W Hignett, assistant managing director, Henry Wiggin and Co , Ltd. , *Ordinary Members of Council*, Dr R W K Honeycombe, professor of physical metallurgy, University of Sheffield , Dr Ivor Jenkins, chief metallurgist, Research Laboratories, General Electric Co , Ltd , E Robson, managing director, Manganese Bronze and Brass Co , Ltd , J Salter, director, British Aluminium Co , Ltd , and C. Smith, works director, James Booth and Co , Ltd

Physical Society Exhibition

The Physical Society Exhibition will be held at the Royal Horticultural Society's Halls, Westminster, London, S W 1 (just behind Victoria Street from Artillery Row), from January 18 until 1 p m on January 22 The opening ceremony will be performed in the New Hall on January 18, 1960, at 11 a m , by Mr A J Philpot (chairman of the Exhibition Committee and vice-president of the Physical Society) in the unavoidable absence of the president of the Physical Society Lectures will be given by Flight Lieut J Billingham (R A F Institute of Aviation Medicine) on "Some Reactions of the Human Body to the Stresses of High Performance Flight" on January 18 , Dr L Essen (National Physical Laboratory) on "Atomic Time" , and Dr D A Wright (Research Laboratories of the General Electric Company, Ltd) on "Recent Advances in Solid State Physics" The lectures will be at 5 45 p m Further information can be obtained from the Society, 1 Lowther Gardens, Prince Consort Road, London, S W 7.

University News : Birmingham

The title of reader in mathematical physics has been conferred on Dr J G Valatin Dr. D A Bell, reader in electromagnetism, and J T Allanson, senior lecturer in electrical engineering, have been appointed joint acting heads of the Department of Electrical Engineering until September 30, 1960, in the absence of Prof D. G Tucker, who is on study leave The University has accepted the offer of Joseph Lucas, Ltd , to finance a Fellowship in the field of metal joining in the Department of Industrial Metallurgy for a period of seven years Research fellowships have been awarded as follows Dr Florence J Pepper (zoology) , Prof L P V Johnson (genetics) , M J Harrison (physics) , and H Mueller (biochemistry) The following appointments are also announced Dr H B Griffiths, to be lecturer in pure mathematics from July 1, 1960 , and Dr J K Brown, to be lecturer in chemistry from January 1, 1960

Oxford

The following research grants are announced from British Petroleum Trading, Ltd , £3,000 spread over three years for the purpose of continuing a research fellowship in geochemistry , and from the du Pont Company, U S A , 3,000 dollars for the year 1960–61, for the support of basic research in the field of theoretical chemistry in the Institute of Mathematics, under the direction of Prof C A Coulson

Announcements

Prof. E. G Cox, professor of inorganic and structural chemistry in the University of Leeds, is to succeed Sir William Slater as secretary of the Agricultural Research Council on Sir William's retirement next year Prof Cox's appointment will take effect from July 1, 1960

The eleventh Annual Lecture of the Plastics Institute will be delivered by Lord Verulam, who will speak on "The Brink of the Unknown" The meeting will be held in the Reardon Smith Lecture Theatre, National Museum of Wales, Cardiff, on April 7, at 6 30 p m

A symposium on Organic-Phosphorus Compounds will be held on January 29 in the Department of Chemical Technology, Bradford Institute of Technology Those taking part include Dr B C Saunders (University of Cambridge), Dr D J. Tuck (University of Nottingham), Dr C B Reese (University of Cambridge), and Dr A F Childs (research director, Albright and Wilson (Mfg), Ltd) Further particulars can be obtained from the Registrar, Institute of Technology, Bradford 7.

The Non-Destructive Testing Group of the Institute of Physics will hold a meeting in London during May 2–4 jointly with the Société Française de Métallurgie The programme will have the general theme of the relationship between structure and physical properties of materials and will include recent advances in non-destructive testing techniques Further information can be obtained from the Secretary, Institute of Physics, 47 Belgrave Square, London, S W 1

Erratum We regret that in the article entitled "Counter-current Distribution of Proteins in Aqueous Polymer Phase Systems" in *Nature* of November 7, p 1465, the blocks for Figs 2 and 3 have been interchanged , the legends, as printed, stand

INTERNATIONAL SYMPOSIUM ON MACROMOLECULES, WIESBADEN

THE annual International Symposium on Macromolecules, held under the auspices of the Commission on Macromolecules of the International Union of Pure and Applied Chemistry, this year took place in Wiesbaden, Germany, during October 12–17 Almost 1,200 people registered for the Conference, which must have been the largest of this series ever held About half the delegates were from Germany and the remainder came from twenty-four other countries, with France, the United States and Great Britain supplying the largest delegations

Organization of a symposium on the above scale must obviously be highly efficient if the work of the Conference is to be carried out, and the organizers deserve the highest credit for the arrangements they made Meetings were held mainly in two large halls in the magnificent new Rhein-Main Halle, the acoustics of which were excellent The general plan of the meetings was as follows The Symposium was divided into five sections (1) Physics of Macromolecular Substances, (2) Macromolecular Substances in Solution, (3) Elementary Processes and Kinetics of Polyreactions, (4) Chemistry of Organic and Inorganic Macromolecular Substances; and (5) Macromolecular Natural Substances and Model Compounds Every day, a plenary lecture was given on some topic from one of the five sections For the remainder of the morning, sessions of two sections were held simultaneously, at each of which three lectures were given that were essentially reviews rather than original scientific papers In this way, practically the whole of the current field of polymer progress was summarized The official languages of the Symposium were German, French and English, and during the morning sessions, translations of the text of the lectures were projected on to two screens behind the speaker, the third central screen being reserved for slides On the whole, the system worked very well, provided the lecturer stuck to his text

The afternoons were devoted to consideration of the numerous short communications, in each of the five main sections, about forty communications, which were intermediate in length and character between a paper and an abstract, had been submitted Discussions of at least two, and sometimes three, sections were held simultaneously in the various halls, about twelve short papers, together with the morning lectures, being discussed at each session While at some sessions the time allocated for discussion was more than adequate, at others the time for discussion of some papers was quite inadequate, and the chairman seemed more concerned to keep to his average 'driving speed' than to promote full discussion. This is a problem that besets all conferences, but perhaps the very size of this one made flexibility of arrangements more difficult (It is only fair to say that numerous participants of the Symposium found no fault at all with the arrangements for discussions)

Faced with more than thirty full lectures, and two hundred short communications, even the most indefatigable student of macromolecules feels surfeited, and becomes highly selective in his attendance For this reason, and because at least two sessions were held simultaneously both in the morning and afternoon, I cannot give a full account of all aspects of the Symposium The following summary covers what seemed the most interesting and significant features of the lectures and papers

In the field of the physics of polymers, there was considerable interest and activity in studies of the mechanism of crystallization and the morphology of crystalline polymers The lectures by A Keller (of Bristol) and W A Kargin (of Moscow), in particular, aroused lively discussions Kargin and also S R Usmanov (of Tashkent) presented the case that polymers that are normally regarded as partly crystalline, such as cellulose, are not truly crystalline in any sense, since they do not pass certain thermodynamical criteria, such as the presence of transition points, and should be regarded only as highly ordered Keller reviewed current opinions on the structure of spherulites and the exciting recent developments in forming macro-crystals of polymers in which the polymer chains are folded back on themselves The other main branches of physics on which attention was centred were dielectric and mechanical relaxation phenomena, nuclear magnetic resonance, and the thermal behaviour of polymers

The study of the properties of solutions of polymers obviously still commands considerable attention, from both the theoretical and the practical points of view P Debye (of Ithaca) presented a new method of estimating molecular interactions from measurements of light scattering, and this gave hope that ultimately a new experimental tool for estimating intermolecular forces would develop Rheological and viscosimetric studies, and in particular the deduction of molecular dimensions from these, comprised one section, while another dealt with the thermodynamics of polymer solutions, and the quantitative determination of parameters such as the virial coefficients, etc Of considerable interest to experimentalists were a lecture by F Patat (of Munich) reviewing osmotic pressure techniques and results, and papers by C Kruissink (of Delft) on the theory, and H -G Elias (of Munich) on the practice, of using membranes partially permeable to the solute Further refinements of conventional methods of measuring molecular weights and molecular weight distributions were described, but there did not seem to be any major new developments in this field

In the section on elementary processes and kinetics of polyreactions, several lively sessions were held One topic that naturally aroused much interest was ionic polymerization, with special reference to stereospecific polymerization Valuable interpretative reviews were given by G Natta (of Milan) on stereospecific polymerization, M Szwarc (of Syracuse, U S A) on anionic polymerization, and M Magat (of Paris) on ionic polymerization initiated by ionizing radiation There were also, of course, numerous short contributions on these topics Ionic polymerizations are attracting considerable attention at present, as a result of the enormous commercial developments following the pioneer work of Ziegler and Natta, and it is certain that, despite the enormous work effort, much yet remains to be discovered The present conference provided some evidence that development has outpaced theory and interpretation, and once this is remedied, and the runners in the race get their second wind, more exciting progress will be made

Fortunately 'steam-radio' (that is, free radical) vinyl polymerizations continue to be studied, with the work perhaps best described as being in the consolidation state Valuable reviews of the applications to polymer studies of radioactive labelling and electron spin resonance were provided by J C. Bevington and D H Whiffen, respectively (both of Birmingham) The industrially very important process of polymerization in heterogeneous media attracted some attention

A session was held on the polymerization of caprolactam, at which all the papers were given by workers on the Continent

One section was devoted to the discussion of natural polymers and model substances W Kuhn (of Basle) gave a fascinating lecture on the production of mechanical energy by macromolecular systems Current interest in polypeptides was reflected by lectures by T Wieland (of Frankfurt) on the organic chemistry of the formation of peptide links and C H Bamford (of Maidenhead) on synthetic polypeptides In these two lectures, a fascinating contrast between the ingenuities of the organic and the physical chemist was displayed Close as are these two studies to the processes of life itself, some studies that were reported on nucleic acids, cancer, and enzyme action were even closer, and demonstrated the extensive range of topics to which polymer science has a major contribution to make

Starch and cellulosic chemistry was also treated in several contributions and lectures by E Husemann (of Freiburg) and H Sihtola (of Helsinki) One interesting new discovery by Ø. Ellefsen (of Oslo) was the preparation of a new crystalline modification of cellulose Only a few papers were given on rubber, including a review by W F Watson (of Shawbury) of recent work on the mechanochemical reactions of polymers

A very interesting section was that on what might be termed the preparative chemistry of organic and inorganic polymers. A review of new condensation polymers was given by H Mark (of New York), this included an elegant demonstration of 'interfacial polycondensation', by means of which high-molecular weight polyamides are formed virtually instantaneously at room temperature The happy term 'Instant Nylon' has been coined in the United States for this polymer The application of classical organic reactions to vinyl polymers leads to many interesting new products, and progress in this field was summarized by G J Smets (of Louvain) Considerable interest is being currently shown in inorganic, and organic/inorganic polymers, and this was reflected in numerous short papers as well as set lectures by E Thilo (of Berlin), H Deuel (of Zurich), H Krebs (of Bonn) and S Nitzsche (of Burghausen) Various unusual organic polycondensation reactions, and methods of forming cross-linked polymers and block copolymers, also received attention

It will be obvious from the above, highly inadequate, summary that there was scarcely an aspect of polymer science that did not receive attention Whether this is the best programme for a conference is a matter for debate, as it can be argued that limitation of the subject-matter promotes a fuller and deeper discussion There can be no doubt, however, that the Symposium once again fulfilled its main purpose of bringing together polymer scientists and promoting fertile interchanges of views

Some of the main lectures have already appeared in *Die Makromolekulare Chemie*, and the remainder, together with the discussions, will appear in later issues

L VALENTINE

INDUSTRY AND THE TECHNICAL COLLEGES IN BRITAIN

AN important paper on the relationship between industry and technical colleges was presented at a conference arranged by the Liverpool District of the Federation of British Industries at Chester on October 21 The speaker, Mr L S Newton, of Pilkington Bros, Ltd, suggested that, despite the increased attention being paid by industry to the education and training of its personnel, there are three ways in which many firms are still not making a real contribution to the development of the educated man-power of Great Britain

Many firms are still evading their responsibility for training young people and are content to recruit their craftsmen, technicians and technologists from other companies Industry should accept the opportunity provided by the 'bulge' to analyse its requirements for the next ten to fifteen years to see how many young people it could now absorb to train for later years Many firms also do not provide facilities for part-time release for study in the day-time—this applies not only to industry but also to professional and commercial undertakings Industry frequently fails to discriminate between the branches of study, the facilities for commercial students remaining quite inadequate

A feature of post-war development has been the remarkable rise in the number of students being released for sandwich courses. The number of students attending the technical colleges full-time or on a sandwich basis has risen tenfold in the past twenty years, between 80 and 90 thousand being in attendance at the moment What the ultimate ratio should be has not yet become clear, but industry's support for sandwich courses is far from uniform and largely in the hands of the larger and more progressive companies

Mr Newton's most important contribution to the conference, however, was concerned with the ways in which closer co-operation between industry and the technical colleges could be achieved.

There are four main places where action could be taken to establish, maintain and foster relationships between the two bodies for their mutual benefit (*a*) there should be a closer tie at the policy-making level, (*b*) there should be a closer tie at the point at which the contents of syllabuses and courses are determined, (*c*) there should be a closer tie at the teaching level, and (*d*) there should be a greater sharing of responsibility for the success of the student

Probably the most important contribution that industry can make is to participate in policy formulation for the organization and administration of technical colleges by serving on college governing bodies and departmental advisory committees Some colleges are still governed by a committee which is a sub-committee of the local further education committee, which itself is a sub-committee of the education committee of the local authority "Moreover, we view with increasing concern the growing intrusion of local political issues into the deliberation of some governing bodies which has a discouraging effect on industrial participation "

Industry must co-operate in the teaching of technical colleges partly by encouraging more of its qualified young men and women to accept part-time teaching posts in the colleges and also by releasing, where necessary, men of appropriate skill and knowledge to teach on a part-time day basis Sandwich courses in particular need teachers with close and current contact with industrial problems, these are not always to be found—nor could they be fully and efficiently employed in the technical college Industry can offer another valuable service—that of taking in the full-time teacher for periods of refreshment in current practice Local education authorities are empowered to release teachers for up to 12 months for industrial experience without loss of pension rights

Since industrial firms supply the great majority of students, they must keep the college generally informed of their education requirements—qualitatively and quantitatively They must keep the colleges informed of the latest developments in their specialized fields and of the needs to which the college can contribute They must support the colleges in their activities and assist them in carrying out their job—whether by loaning staff or equipment or giving them the benefit of their knowledge in the advisory or administrative fields They must consult with them on all matters of joint interest and maintain a constant flow of information in both directions

The conference was attended by 140 representatives of education and industry from north-west England

MODERN NETWORK THEORY IN ELECTRICAL ENGINEERING

THE first phase in the development of network theory was opened by the work of Ohm in 1827 and may be regarded as being terminated, at the end of the nineteenth century, by the work of Heaviside By this date the main concepts and methods of network analysis were established and although mathematicians more orthodox than Heaviside were yet to present operational methods in a different light, little other work of significance appeared between 1900 and 1922 The subsequent growth of network theory was greatly stimulated by the use of the notion of a complex frequency, a concept which, in its turn, grew out of the application of the theory of functions of a complex variable to those problems of time-variation in networks which had previously been treated by the methods of Heaviside

With the introduction of more powerful mathematical tools it became possible, in the second and present phase in the growth of network theory, to treat the problems of realizability, synthesis, approximation and practical design, that is to say, which mathematical functions may be realized as network characteristics ? How may networks having prescribed, realizable, characteristics be found ? By what approximations may a desired physical response be most usefully and economically translated into a set of realizable mathematical functions ? In what manner do the general mathematical processes of realization and synthesis require to be treated if the outcome is to be a practicable network using a comparatively small number of relatively cheap components ?

These are some of the questions with which modern network theory is concerned, and to discuss them the Department of Electrical Engineering of the University of Birmingham organized an informal conference which took place in that Department during September 21–24 The main purpose of the conference, believed to be the first on this subject to be held in Britain, was to give ample opportunities for the discussion of network problems, and the lectures and papers which were presented took up only one-half of the time of each session in order to permit this In a limited space it is not possible to give equal treatment to every paper and discussion, but it is hoped that the nature of some of the problems discussed will be made clear by the following account

Of all the sessions, the first was the most fundamental and abstract but also at the greatest remove from any immediate relevance to practical problems Mr P R Bryant (General Electric Co , Wembley) spoke on a topological analysis of the order of complexity of an electrical network The 'order of complexity' was defined as the number of the natural frequencies of an electrical network and this number was shown to be equal to the number of dynamically independent network variables In order to prevent too naive an approach to this work it is only necessary to point out that a network of n capacitors connected in series possesses an 'order of complexity' of n, whereas the network formed by connecting the capacitors in parallel is of order 1 The other paper in this session was presented by Dr V Belevitch (C E C E , Brussels) and was concerned with a treatment by matrix algebra of the realizability theory for general linear, stable networks with n terminal-pairs

A discussion on a group of papers on networks with parameters varying with time was opened by the authors—Prof D G Tucker, Mr D P Howson and Mr J M Layton (University of Birmingham) A major part of the discussion centred on the possibility of applying, to networks with parameters varying with time, theorems developed from a study of networks with constant parameters That care is needed in making translations of this kind was shown by a demonstration in one of the papers that the input impedance of certain rectifier modulators was dependent on the nature and magnitude of the impedance associated with the source used to provide the input voltage and current This result is more surprising than the discovery that theorems such as those of Thévenin and Norton cannot usefully be applied to many networks varying with time Much more work is required to define the types of networks to which the main results of classical theory may be applied, and it is evident that the analysis of networks containing reactances varying with time presents many problems, not the least of which is that of determining the conditions for stability

In the third session Dr O P D Cutteridge (Manchester College of Science and Technology) spoke on the application of a particular continued-fraction expansion to a range of problems of active and passive networks The expansion may also be used to determine the character of the zeros of a polynomial

A lengthy discussion was initiated by a paper on the synthesis of three-terminal resistance-capacitance networks, presented by Mr J T Allanson (University of Birmingham) There exists no complete solution to the problem of designing a network of this kind if the three impedance functions of the network are specified It can be shown, by analysis of real networks, that the impedance matrix for any three-terminal resistance–capacitance network must necessarily satisfy certain conditions it can also be shown, by synthesis of networks, that if an impedance matrix satisfies a more extensive set of conditions a network of this type may be found to represent the matrix The paper and the discussion were concerned with attempts to close the gap between these two—the necessary and the sufficient—sets of conditions

A discussion of a similar kind took place after Dr W Saraga (Siemens Edison Swan, London) had discussed the analysis and synthesis of reactance networks in terms of the 'one-points' of various functions The traditional methods of analysis and synthesis have regarded the poles and zeros of various network functions as constituting the most easily handled specification of these functions, but there are certain advantages in using the values taken by the complex frequency variable when the functions in question have the values of ± 1 However, the simplicity of procedure which results from using these 'one-points' in network synthesis has to be paid for by an increase in the number of network elements required to realize a given set of functions In practical applications these redundant elements must be removed and the series of network transformations necessary to do this may be sufficiently complicated to nullify the advantages of the preceding simplicity It appears that 'one-point' analysis may be most usefully applied as complementary to pole-zero analysis in revealing useful general relations in networks

Dr G S Brayshaw (University of Leeds) presented a paper dealing with an application of positive-real graphs and Dr A Talbot (Imperial College, London) discussed the use of Tchebyscheffian approximations in network synthesis, and outlined an algebraic method for the determination of rational approximating functions suitable for filters required to have Tchebyscheffian characteristics in both pass and stop bands

In the fourth session of the conference two papers were read on the design and construction of filter networks Mr E R Austin (Post Office Research Station, London) outlined a computational procedure for obtaining, in the form of a ladder network, an image parameter filter in which advantage is taken of the theoretical possibility of specifying independently the attenuation and impedance characteristics The design may be regarded as yielding a filter more efficient than the corresponding Zobel type but less so than one designed on an insertion loss basis Dr J H Mole (H M Underwater Detection Establishment, Portland) spoke on problems of component design, accuracy and tolerance, mechanical construction and the testing and measurement of practical filters

The final session of the conference was taken up with a discussion on the place and teaching of electrical network theory in universities and technical colleges Mr F E Rogers (The Polytechnic, London), Dr A W Keen (Coventry Technical College), and Mr E R Broad (Post Office Research Station, London) opened the discussion, which was vigorous but inconclusive However, it was agreed that more attention must be paid to the physical and mathematical fundamentals underlying the practical techniques for the solution of network problems and less time given to these techniques themselves

J T ALLANSON

BRITISH OVERSEAS INFORMATION SERVICES

IN a written statement circulated in reply to a question in the House of Commons on November 16 as to the implementation of the proposals in the White Paper on Overseas Information, the Chancellor of the Duchy of Lancaster, Dr C Hill, stated that since April 1, 1959, the British Council has recruited 140 teachers of English for overseas posts, and expenditure on exchanges of university teachers with foreign countries has risen from £6,164 in 1958–59 to about £9,014 for 1959–60, for Commonwealth exchanges the corresponding figures are £12,113 and £16 113 The number of scholarships awarded by the Council has risen from 284 in 1958–59 to 355 in 1959–60, and of these 98 and 141, respectively, were related to the teaching of English, including twelve new scholarships for students from the Colonial territories for teaching English as a second language, 14 studentships at the University of London Institute of Education for United Kingdom graduates intending to teach English overseas, and fifteen new posts concerned with the teaching of English established overseas Educational exchanges with Czechoslovakia and Hungary have commenced, including a three-week visit to British universities of six professors from Czechoslovakia Government grants to the British Council were estimated at £5,824,000 for 1959–60, compared with £4,615,000 in 1958–59

Expenditure on British Council libraries was £234,000 in 1958–59 and will rise to about £480,000, for books and periodicals for presentation, the corresponding figures are £39,000 and £72,000 In consultation with the Governments concerned, twenty new British Council libraries have been, or will shortly be, set up, and long-term lending library services for students are now operating or will shortly operate at nine Council centres and through universities Libraries of the long-lending type are already operating in Karachi, Rawalpindi and Dacca and in process of being extended to Lahore and Chittagong, and first indications are that they are a great success More than 30,000 books have been sent out and 235 additional subscriptions to periodicals provided for

Council libraries in India since April 1, 1959 , for Pakistan, the corresponding figures are nearly 40,000 and 104 Measures to promote exports of British books and periodicals are making good progress, and proposals have been put to the Governments of Indonesia, Israel, Pakistan, Poland and Yugoslavia with the aim of agreeing upon schemes broadly on the lines of the former British book export schemes Trade organizations in the periodical field have been consulted on measures to assist circulation of newspapers and periodicals in some of the more difficult markets overseas

In broadcasting, Dr Hill said that excellent progress has been made with the construction of the new relay transmitter at Berbera, and the Arabic Service of the B B C is now transmitting for 12 hr daily compared with 4 5 hr in 1957 Efforts have been made to increase both the local and general appeal of the Service, and arrangements have been made to provide the local Press and broadcasting services in East Africa and Aden with more material on the background in the news A conference of the Governments of the East African territories, Aden and the Somaliland Protectorate in March 1959 provided a valuable interchange of information and ideas, and the re-appraisal of the Overseas Service of the B B C in English, nearing completion, has given full weight to the special importance of increasing the appeal of these Services to the rapidly growing number of listeners overseas for whom English is a second language Studies have been made of the possibility of introducing television in Aden

With regard to official services, a United Kingdom Information Office has been opened in Kampala and premises in Nairobi are being equipped , expenditure on television material for showing overseas is expected to be £138,000 in 1959–60 compared with £121,000 in 1958–59, and all the expansions recommended in the Central Office of Information Services have been made or are in progress These include improvements in the Press and telegraph services, a radio-type service for local broadcasting in Arabic, Somali and Swahili , the completion of three experimental television films for the British Council on the teaching of English , increased supply of trade and technical periodicals overseas and an expanded programme of overseas visits, especially on the Commonwealth side A Commonwealth Exhibition, intended as the focal point of 'Commonwealth Weeks' in several major cities, was opened in Liverpool on November 19 The cost of the Overseas Information Services in 1959–60 is now estimated at about £16 5 million a year, while measures to promote exports of British publications will cost about a further £500,000 a year

METALLOGENIC MAPS

THE notion and the term metallogenic or metallogenetic are due to L de Launay, who in 1900 proposed the terms 'metallogenic provinces' and 'metallogenic epochs' Respectively, these two terms meant a particular geographical region or a specific geological epoch characterized by a particular assemblage of mineral deposits The representation of such a province or provinces on the map led to the construction of metallogenic maps Such a map differs from what is called a 'mineral map' A mineral map only shows the distribution of one or several mineral deposits, while the aim of a metallogenic map is not only this but also to relate the distribution of such deposits to the geological formations or periods and to the tectonic features of the region This leads to the discovery of particular areas of distribution or zones of occurrence , changes in the character of mineral deposits in time , association of certain chemical elements among the deposits, and many other features .

During the past few decades the problem of construction of metallogenic maps of various countries or on an international basis has been discussed At the International Geological Congress held in Mexico City in 1956 a Sub-Commission for the Metallogenic Map of the World was created During March–April 1958 this Sub-Committee, as a part of the wider Commission of the Geological Map of the World, met in Paris (*Nature*, 182, 502 , 1958) At this meeting a number of metallogenic maps of different countries were shown and discussed and the future programme outlined

In the U S S R the problem of metallogenic provinces, epochs and maps were particularly discussed by the late Y A Bilibin (1901–52) and S S Smirnov (1895–1947), and at the present time this work occupies the forefront of geological research Valuable contributions to the metallogeny of various ores were recently made by N S Shatsky, discussing the manganese ores (*Bull Acad Sci U S S R* , *Ser Geol* , 4, 3 , 1954), and phosphorite deposits ("Conf Sed Rocks, Acad Sci U S S R ", 2, 7 , 1955) The metallogeny of Kazakhstan has been discussed by K I Satpaev (*Bull Acad Sci U S S R* , *Ser Geol* , 6, 34 , 1953) and A I Semenov (*Soviet Geology*, 58, 110 , 1957) The principles of regional metallogenic analysis have been discussed by V I Serpukhov (*Soviet Geology*, 43, 27 , 1955) The principles of metallogeny and the construction of metallogenic maps are discussed by E T Shatalov (*Bull Acad Sci U S S R* , *Ser Geol* , 9, 37 , 1958) An attempt at a general metallogenic survey of the territory of the Soviet Union and the construction of a metallogenic map of the U S S R was made by V I Smirnov (*Bull Acad Sci U S S R* , *Ser Geol* , 4, 3 , 1959 and *Priroda*, 4, 17 , 1959) Recently, E A Radkevich (*Bull Acad Sci U S S R* , *Ser Geol* , 5, 125 , 1959) has published a report of the All-Union Metallogenic Conference held in Alma-Ata during December 1958, at which 800 delegates and visitors were present and a number of papers read and discussed A valuable summary of the work done in the Soviet Union in this field combined with a manual for the preparation of metallogenic maps has been published in book form It is edited by P M Tatarinov, V G Grushevoy and G S Labazin, and it is entitled "General Principles of a Regional Metallogenic Analysis and of the Methods of Compilation of Metallogenic Maps of Folded Regions", published by "Gosgeoltekhizdat", Moscow, 1957 (150 pages , price 7r 20k) This volume contains seven articles dealing with the general principles of a regional metallogenic analysis, sedimentary and igneous formations, mineral deposits complexes, metallogenic zones and methods of compilation of metallogenic maps

ULTRASONICALLY DISPERSED SODIUM

By M. W. T. PRATT and R. HELSBY

General Chemicals Division, Imperial Chemical Industries, Ltd., Widnes Laboratory, Widnes

MANY chemical reactions involving sodium benefit from the use of the metal in a highly dispersed form. The surface area available for reaction is then very large: for example, the surface area of spherical particles of sodium 1 micron in diameter is 6×10^4 sq. cm. per gm. Recently, we have prepared, by an ultrasonic technique, much finer dispersions of sodium in hydrocarbons than can be made by the high-speed stirring methods most commonly used.

The production of sodium dispersions ultrasonically is simple; a molten mixture of sodium and hydrocarbon dispersing medium is ultrasonically irradiated for a few minutes under an inert atmosphere (a patent has been applied for to cover the process). A laboratory apparatus capable of producing 200-gm. quantities of sodium dispersions by this method is sketched in Fig. 1. An ultrasonic magneto-strictive transducer with a resonant frequency of 25 kc./s. is sealed by a 'Neoprene' ring into a cylindrical 'Pyrex' reactor (15 cm. × 6 cm.). Ultrasonic irradiation is applied to a molten charge of sodium and dispersing medium at a power of approximately 250 W. for about 10 min., until the colour of the dispersion becomes constant, indicating that the equilibrium state of dispersion has been reached. The dispersion is then forced out of the reactor by pressure of inert gas into a container, from which the air has previously been displaced by inert gas.

Fig. 1. Apparatus for the preparation of small batches of ultrasonically dispersed sodium

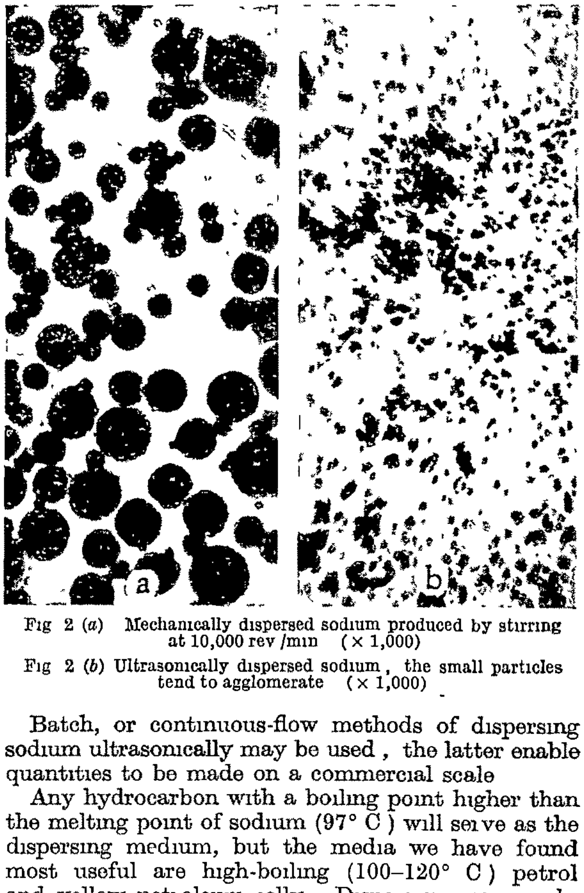

Fig. 2 (a). Mechanically dispersed sodium produced by stirring at 10,000 rev./min. (× 1,000)

Fig. 2 (b). Ultrasonically dispersed sodium; the small particles tend to agglomerate (× 1,000)

Batch, or continuous-flow methods of dispersing sodium ultrasonically may be used; the latter enable quantities to be made on a commercial scale.

Any hydrocarbon with a boiling point higher than the melting point of sodium (97° C.) will serve as the dispersing medium, but the media we have found most useful are high-boiling (100–120° C.) petrol and yellow petroleum jelly. Dispersions can easily be made ultrasonically containing 15 per cent sodium by weight in petrol and 25 per cent by weight in petroleum jelly. Sodium particles in fluid hydrocarbons are rapidly attacked by air and water, and should be used immediately after preparation. Sodium dispersed in yellow petroleum jelly reaches an exceptionally fine state of subdivision, possibly due to the presence of a natural dispersing agent in the jelly. The sodium particles in this paste-like medium are protected from attack by air and moisture, so that the dispersions keep well, and can be safely transported. The sodium is liberated for reaction either by melting the jelly, or dissolving it in petrol; to avoid decrease in reactivity, this must be done under an inert atmosphere.

Stirring molten sodium and dispersing medium together mechanically at 10,000–20,000 rev./min. produces grey-coloured dispersions in which the particles are mainly between 3 and 15 microns in diameter. A photomicrograph of a typical mechanically produced dispersion in petroleum jelly is shown in Fig. 2a. Nearly all the particles in ultrasonically dispersed sodium in petroleum jelly are 1 micron or

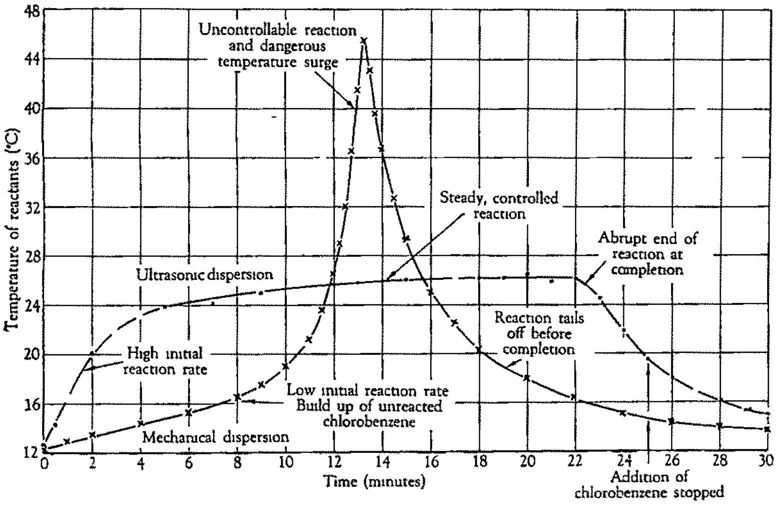

Fig 3 Comparison of the reactivities of sodium dispersed mechanically and ultrasonically

less in size (Fig 2*b*), and these dispersions have a deep blue or purple colour This colour is probably due to the scattering of light by the small particles, analogously to the production of the blue colour of the sky by the light-scattering effect of dust particles

Having established that ultrasonic techniques enable sodium to be dispersed to a higher degree than is possible by rapid stirring, we showed that the extra fineness produces advantages in chemical reactions greater than those gained by the use of mechanically dispersed sodium This is well demonstrated in the exothermic reaction between sodium and chlorobenzene to produce sodium phenyl This reaction is sometimes difficult to initiate, even when the best mechanically dispersed sodium is used However, when sodium ultrasonically dispersed in petroleum jelly is used (afterwards dissolved for reaction in 100–120° C petrol), reaction is always initiated at once, even at 20° C, which is a low temperature for this reaction The reaction-rate is 10–20 times greater for ultrasonically dispersed sodium than for the mechanically dispersed metal

In experiments performed with small quantities of reagents, chlorobenzene was added continuously, at the rate of 0 5 ml per min, to 6 gm of sodium dispersed in petroleum jelly, afterwards dissolved in 150 ml petrol Fig 3 shows that, under these conditions, ultrasonically dispersed sodium immediately reacts at a high rate (indicated by the rapid rise in the temperature of the reactants towards its equilibrium value) and the reaction is smooth and controllable Under the same conditions, mechanically dispersed sodium is not able to react quickly enough to prevent a build-up of unreacted chlorobenzene, eventually the accumulation of chlorobenzene reacts at an accelerating rate, and an uncontrollable temperature surge occurs When this reaction has been carried out on a large scale, using mechanically dispersed sodium, temperature surges have sometimes been sufficient to boil the dispersing medium, and serious explosions have followed

It is therefore advantageous to use ultrasonically dispersed rather than mechanically dispersed sodium in the preparation of sodium phenyl, and this is likely to be the case for many other reactions also The benefits commonly claimed for the use of mechanically dispersed sodium instead of the bulk metal can now be extended in higher degree to the use of ultrasonically dispersed sodium, for which the advantages may be summarized as follow

Faster reaction rates are obtained as a consequence of the large surface area of a fine dispersion

Improved reaction control follows, for there is no accumulation of unreacted material, and the sodium can be added at an easily and precisely regulated rate

Temperatures can be lower due to the high reactivity of the dispersions Sudden temperature surges, which may occur with the use of bulk or mechanically dispersed sodium, are eliminated, and the reaction temperature may be held within close limits

Elimination of side reactions frequently results from the use of low reaction-temperatures

Higher yields result from the above advantages, and also because dispersions are completely consumed in conditions in which an insoluble reaction product coats the surface of bulk sodium, and prevents the reaction of a large fraction

Replacement of more complex reagents such as sodium alkoxides, sodium hydride, and sodamide by sodium dispersions is possible in reactions which do not proceed satisfactorily with the bulk or mechanically dispersed metal

Chemical reactions in which these advantages are likely to result include Claisen condensations, Wurtz reactions, preparation of sodium alkyls, aryls and alcoholates, metalations, replacement of active hydrogen atoms and the purification of hydrocarbons

We are grateful to many colleagues in Imperial Chemical Industries, Ltd, who designed and built the ultrasonic equipment we used

---

SWELLING FORCES IN STRAINING CLAYS

By E. L. GREACEN
Division of Soils, Commonwealth Scientific and Industrial Research Organization, South Australia

IT is generally accepted that the compression and swelling of a clay saturated with sodium ions is described by the osmotic theory of swelling[1–3] This theory is based on osmotic effects associated with the adsorbed layer of ions in clays[4,5], and relates the thickness of the water layer between two clay plates to the swelling pressure[2] In the case of calcium clays, however, although the virgin compression curve agrees reasonably well with the theoretical curve, the subsequent swelling on decompression does not Warkentin, Bolt and Miller[3] concluded in this regard that either an unspecified attractive force was operating or that the osmotic swelling force was somehow diminished If these conclusions can be

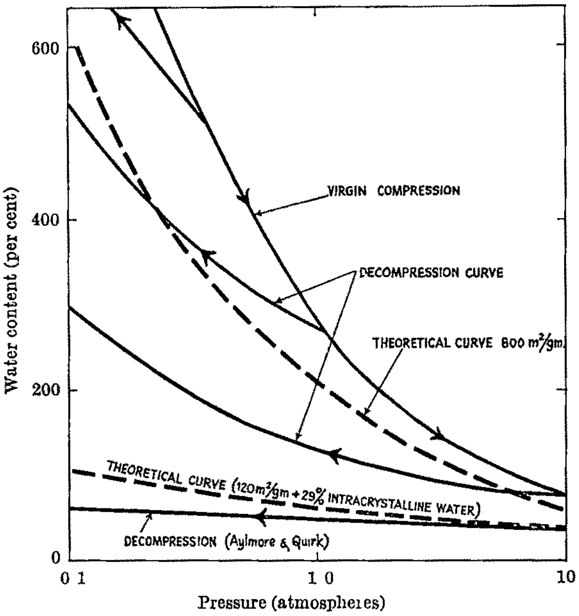

Fig 1 Compression and decompression curves for calcium clay with theoretical swelling curves

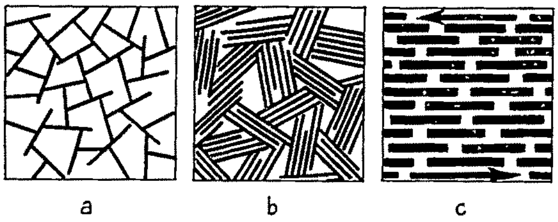

Fig 2 Possible structure in (*a*) flocculated clay, (*b*) consolidated clay, (*c*) illite clay in the ideal straining *CVR* condition

accepted, they suggest an explanation of the behaviour of clays when they are strained under load

Recently, however, Aylmore and Quirk[6] have questioned the interpretation of these results on the grounds that for the calculation of film thickness Warkentin *et al* took as the specific surface of their calcium montmorillonite a value of 800 m^2/gm, whereas Aylmore and Quirk found that for a similar clay 648 m^2/gm out of a total surface of 760 m^2/gm was intracrystalline and not operative, giving an effective surface of only 112 m^2/gm They concluded that the osmotic theory of swelling does not apply to clays saturated with calcium ions

The point of difference can be explained readily by reference to Fig 1 In order to overcome the above objection, I have plotted the results of Warkentin *et al* as water content, in the place of film thickness, against the applied pressure I have also included a probable swelling curve for Aylmore and Quirk's clay from the results they have given The theoretical curves (broken lines) give calculated pressures for values of film thickness which would exist for the two cases where (i) the whole surface, 800 m^2/gm, is active and (ii) where approximately only one-seventh, 120 m^2/gm, is active and the curve is corrected for intra-crystalline water[6] It appears that the calcium clay is becoming compressed from the virgin condition against a pressure that is somewhat higher than would be expected even from an osmotically active surface of 800 m^2/gm I conclude that a separated plate model (Fig 2*a*) is suggested by the results, and that this becomes compressed progressively to the condition shown in Fig 2*b*, similar to that proposed by Aylmore and Quirk

The interesting feature of the curves of Fig 1 is the apparent relation between the theoretical swelling curve and the *CVR* line[8] of soil mechanics When a virgin compressed clay is strained under shear, it becomes compressed further to a state where the voids ratio (water content) is in equilibrium with the compression load, this is called the critical voids ratio state and a plot of the critical voids ratio against the effective pressure is known as the *CVR* line Furthermore, when an over-consolidated clay, that is, one that has been compressed and then unloaded to some point on the decompression curve (Fig 2), is strained under a shear stress, it swells to an equilibrium voids ratio which is described by the same *CVR* line[7,8] Consider now the model for the calcium clay during virgin compression Edge to face bonds, or short-range attractive forces which could operate under the conditions of Fig 2*a*, will assist the osmotic swelling force in resisting volume change during compression, but on the other hand they will oppose swelling forces during decompression This explains why the theoretical curve falls below the virgin compression curve in Fig 1 Further, if we accept the unique nature of the *CVR* line for a straining clay, it follows that short-range forces are not operating at all during shear, but that the *CVR* state represents a balance between only the osmotic swelling pressure and the external force It is suggested that when a compressed clay (Fig 2*a*, *b*) is strained under shear, the short-range forces are overcome, and the clay plates are fully oriented (Fig 2*c*) at a spacing outside the range of these forces I have described[9] a rheological model consisting of friction bodies and springs which allows for this explanation of the *CVR* state

In Fig 3 the *CVR* line[10] is given with compression and swelling curves[11] for a sample of London clay This soil is illitic, with clay ($<2\mu$) content 69 per cent, specific surface 88 m^2/gm, and 15 m equiv of

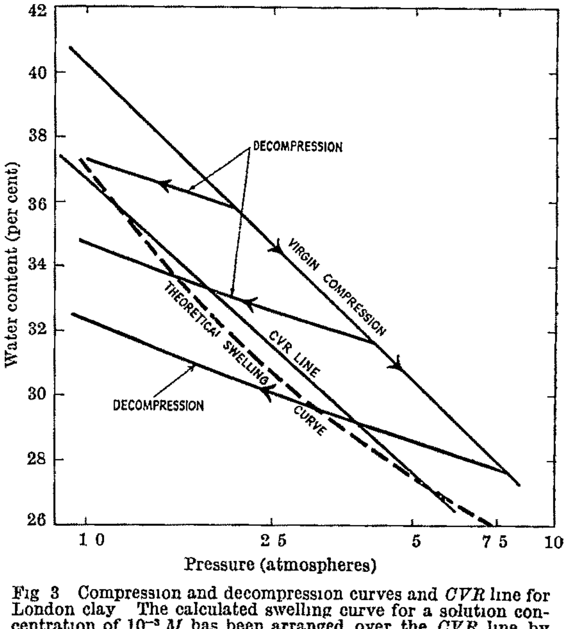

Fig 3 Compression and decompression curves and *CVR* line for London clay The calculated swelling curve for a solution concentration of $10^{-3} M$ has been arranged over the *CVR* line by a 'dead' volume correction of + 26 A

exchangeable calcium out of a total exchange capacity of 19 m equiv /100 gm (ref 12) From the above data the specific surface for the clay fraction is about 120 m ^{2}/gm , which is the value for illite used by Bolt and Miller[2] A value of 10^{-3} M has been assumed for the soil solution concentration, although this is not critical On the assumption that the change in volume of the clay fraction accounts for the change in volume of the whole soil, I have calculated a theoretical swelling pressure curve This curve has been arranged over the *CVR* line by correcting for a dead volume of water equivalent to a film thickness of 26 A According to Bolt[1], this dead volume represents the volume of water which, due to the geometry of clay particles, cannot be expelled from the soil by compression For London clay a correction for dead volume of 30 A places the theoretical curve exactly over the virgin compression curve , for Weald clay, for which parallel data are available[10-12], a value of 36 A is required These agree with the 30–40 A shift found by Bolt for a prepared illite It should be noted that, although the position of the theoretical curve relative to the *CVR* line depends solely on the dead-volume correction, the two curves have the same slope This shows that the osmotic theory can account for the change in volume of calcium illite under these conditions

The above model also suggests a method for testing the existence and effect of long-range attractive forces in clays Since such forces will oppose osmotic repulsion during both swelling and compression, their presence should not deny the unique nature of the *CVR* line as would short-range forces On the other hand, since for a given external pressure the osmotic theory requires approximately double the interparticle spacing for a sodium compared to a calcium clay, one might expect the effect of long-range forces to differ for the two systems Any such difference would at present be lost in the dead-volume correction

The above results do not prove conclusively that the simple osmotic theory is applicable to calcium clays, but they do show that it can provide a reasonable working hypothesis in an otherwise obscure field It should not be lightly discarded The theory could be tested by measurements of the degree of orientation obtained during compression and compression with shear Further progress seems to lie in a more critical estimation of the *CVR* concept and of the dead-volume factor for both sodium and calcium clays in the straining condition

A SPECIFIC RESPONSE IN THE HIPPOCAMPUS OF THE RABBIT TO OLFACTORY STIMULATION

By B G CRAGG*
Department of Anatomy, University College, London

THE olfactory bulb projects to the piriform lobe through the lateral tract and through the more medial radiation which is continuous with the anterior limb of the anterior commissure The distribution of these tracts within the piriform lobe has been described in experimental material stained by the method of Glees[1,2] Terminations are seen mainly in the prepiriform cortex, anterior olfactory nucleus, olfactory tubercule and central amygdaloid nucleus The projection to the last-named area is probably derived from the medial radiation rather than from the lateral tract, and is bilateral No terminations have been seen in the hippocampus or in the septum The distribution in the piriform lobe of electrical responses to olfactory stimulation is substantially compatible with the histological findings[3-5] An electrical response in the hippocampus to single electrical stimuli applied to the olfactory bulb has however been claimed[6] but not confirmed The purpose of this article is to describe a large and consistent electrical response in the hippocampus of the rabbit that can be obtained by suitable repetitive stimulation of the olfactory tracts

Electrical recordings were made from an insulated needle with a bare tip of diameter 10μ placed in the pyramidal cell layer (Ammon's horn) of the hippocampus while electrical stimuli were applied to a radial pair of needles placed in the olfactory peduncle to stimulate both the medial radiation and the lateral tract Stimulation at a frequency less than 8 per sec sometimes elicited very small evoked responses in the hippocampus At a frequency of stimulation between 8 per sec and 20 per sec , however, large evoked responses invariably occurred throughout the dorso-ventral extent of the ipsilateral hippocampus, but only after 50–100 stimuli had been delivered At frequencies between 20 per sec and 230 per sec no hippocampal response was seen, but if the stimulation rate were switched down to 5–20 per sec after 50–100 stimuli had been delivered at a higher frequency, large evoked hippocampal responses were obtained after 5–10 stimuli had been given at the slower rate

Evoked hippocampal responses were obtained by stimulation of the medial radiation alone, but not by stimulation of the lateral tract alone If, however, repetitive stimulation were suddenly switched from electrodes in the medial radiation to electrodes in the lateral tract while the hippocampus was responding, the responses continued unchanged except for a small increase in latency The same result was obtained on switching from the ipsilateral to the contralateral medial radiation, for hippocampal responses can be continued but seldom started by contralateral stimulation A similar switching of repetitive stimulation from the medial radiation to the central cut end of the optic, sciatic or vagus nerves immediately terminated the evoked hippocampal responses Moreover, if repetitive stimulation were applied both to one of these nerves and to the medial radiation until hippocampal responses were obtained, the evoked responses ceased at once if the olfactory stimulation were stopped while the nerve stimulation was continued These hippocampal responses in the rabbit are therefore specifically related to the olfactory system

---

* Leverhulme Mental Health Research Fund Fellow

The hippocampal response first appears after 50–100 stimuli as a small deflexion with a latency of 40–60 msec , but with 5–10 more stimuli the latency decreases to 20–24 msec and the full amplitude of up to 3 mV is attained With repetitive stimulation at 8 per sec this response persists for 30–40 sec after which the amplitude declines and the latency increases until the response disappears again with a latency of 60 msec Apart from rare immediate recurrences, no further response can then be obtained until 90 sec have elapsed without stimulation, although the response can be recalled for a few seconds by an early high-frequency tetanus If the repetitive stimulation is stopped when the hippocampal response has just attained the full amplitude there is a brief after-discharge

Electrical recordings have been made at different depths in the hippocampus to identify the elements responding (Fig 1) Negative wave-forms are seen at the level of the pyramidal neurones in area CA_1 but positive wave-forms appear at the level of the dendrites in the upper blade of the dentate gyrus, and persist in area CA_4 and in the rest of the dentate gyrus Recordings on other electrode tracks show a negative response in area CA_2 but not in area CA_3

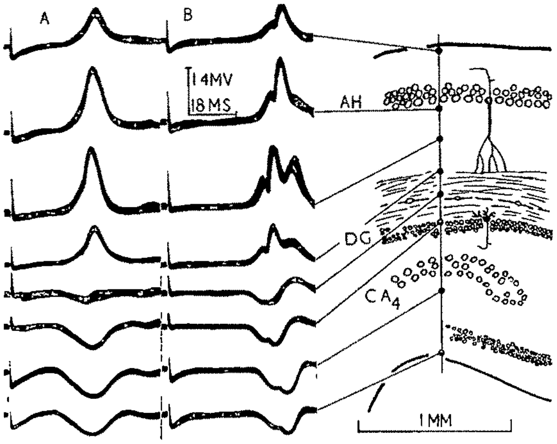

Fig 1 Electrical recordings made at different depths in the dorsal hippocampus of a rabbit anæsthetized with urethane during the stimulation of the ipsilateral olfactory peduncle at 8 per sec The diagram shows the positions of recording on a tracing of a frontal section through the needle track A single neurone has been represented in the Ammon's horn with the apical dendrite below the cell body, and the axon above In the dentate gyrus another single neurone is represented with the dendrites above and the axon below the cell body *A*, the wave-forms recorded after 10 sec of stimulation , *B*, after a further 30 sec of stimulation, negative polarity upwards , *AH*, area CA_1 of the Ammon's horn , *DG*, upper blade of the dentate gyrus

The interpretation of these findings is that only the pyramidal cells of areas CA_1 and CA_2 respond to the stimulation The same distribution of potentials is seen throughout the dorso-ventral extent of the hippocampus

This hippocampal activity might be expected[7] to lead to visceral changes Recordings of visceral activity show that the blood pressure rises slightly and the respiration is often increased in the period between the beginning of olfactory stimulation and the occurrence of the hippocampal response When the latter appears the blood pressure starts to fall, the respiration is reduced, and the bladder and rectum contract These latter effects soon pass off, but the fall of blood pressure continues as long as the hippocampus continues to respond, and the total fall may exceed 40 mm mercury When after 30–40 sec the hippocampal responses cease, the blood pressure promptly rises again although the stimulation is continued The low level of blood pressure is not the cause of the eventual failure of the hippocampal response, for the latter may occur at 80 mm mercury after a fall from 120 mm mercury, whereas a hippocampal response can be started with olfactory stimulation at a blood pressure of 40 mm mercury though not at 25 mm mercury

These visceral changes coincide with, but are not in fact caused by, the activity of the hippocampus, for the fornix can be cut on both sides and the hippocampus dissected out with a sucker without affecting the visceral changes It was found that the electrical responses of the hippocampus were unaffected by cutting the fornix or the fimbria, but were abolished by section of the angular tract of Cajal[8] at a position ventral to the point of recording This finding, together with the fact that the shortest latency of the hippocampal response is 2–3 msec less in the ventral than in the dorsal hippocampus, implies that impulses reach the dorsal hippocampus by ascending the angular tract from the piriform lobe Activity of neurones in the latter concurrent with the hippocampal response is believed to cause the visceral changes Similar visceral effects can be elicited by direct stimulation in the prepiriform cortex after ablation of the hippocampus Impulses are presumably relayed from the prepiriform cortex to autonomic centres in the hypothalamus or brain stem

Electrical recordings have been made throughout the piriform lobe during olfactory stimulation in order to trace the olfactory impulses to the hippocampus Responses to single shock stimulation of the lateral tract were found ipsilaterally in the olfactory tubercule and throughout the prepiriform cortex as far caudally as the periamygdaloid cortex The responses had a latency of 2–5 msec to first inflexion and reversed sharply in polarity, being positive dorsal to the cell bodies and negative ventrally in the region of the axo-dendritic synapses Similar responses and some later deflexions were obtained in these same areas, and also bilaterally in the amygdaloid complex, with single shocks applied to the medial radiation in the olfactory bulb after cutting the visible part of the lateral tract

When repetitive stimulation is applied to the medial radiation the primary responses described above continue , large secondary responses appear throughout the piriform lobe but not in the posterior superior entorhinal cortex at the same instant that the hippocampal response appears These secondary responses vary in latency from 6 msec in the olfactory tubercle to 18 msec in the amygdala At any position of recording the latency gradually increases after 10–20 sec. of stimulation. In the amygdala and in the caudal prepiriform cortex the secondary responses eventually disappear at a latency of 50–60 msec. at the same time that the hippocampal response disappears. In the olfactory tubercule and in the more cranial prepiriform cortex, however, the secondary responses increase in latency to about 20 msec., but may persist indefinitely with continued stimulation. The secondary responses are negative in polarity dorsal to the pyramidal cell bodies (where the primary response is positive), and reduced in amplitude but still mainly negative in polarity ventrally where the primary response is negative.

After recordings had been made at each placement, stimulation was applied to the needle electrode in the prepiriform cortex and further recordings made from the hippocampus. It was found that a large hippocampal response can often be elicited by single shock stimulation of the prepiriform cortex at intervals of not less than 1–2 min. With more rapid repetitive stimulation a hippocampal response was obtained only after many stimuli had been applied, the number increasing at more cranial placements of the stimulating electrode. The hippocampal response to stimulation at the more cranial placements gradually increased in latency and eventually disappeared, but stimulation in the more caudal prepiriform cortex elicited earlier hippocampal responses which persisted indefinitely with continued stimulation.

The primary responses in the prepiriform cortex to single shock stimulation of the lateral tract or the medial radiation were unchanged when the stimulation was made repetitive until the secondary responses appeared in the piriform lobe and hippocampus. At this instant the primary response was slightly reduced, and with continued stimulation the primary response progressively decreased to about a third of the initial amplitude at cranial positions of recording, or about a tenth of the initial amplitude in the periamygdaloid cortex. When the hippocampal response disappeared the primary response partially recovered, but complete recovery never occurred during continued stimulation. Complete recovery required at least 40 sec. without stimulation. This inhibition of the primary response took place without apparent change of latency and was not due to hippocampal activity, since it was unaffected by section of the fornix and angular tract.

The inhibition of the primary response increases at more caudal positions of recording, and so does the amount by which the latency of the secondary response can increase. These results suggest that the olfactory impulses are relayed through many neurones in the prepiriform cortex towards the ventral hippocampus, and that both excitatory and inhibitory connexions are activated. It was found that when small lesions were made in the prepiriform cortex, degenerating axons could afterwards be traced caudally by the Nauta-Gygax technique. Many of these axons end in the prepiriform cortex, but others continue in layer 1 through the entorhinal cortex to the subiculum of the ventral hippocampus. It will be of interest to see whether the remarkable changes of latency that occur in transmission through the prepiriform cortex are common to other systems in which multiple short and long connexions are made.

A specific relationship of the hippocampus to the olfactory system is unexpected[9,10], for the spontaneous electrical rhythms of the hippocampus can be changed by afferent impulses of any modality[11]. The specificity of the large hippocampal responses in the rabbit to olfactory stimulation may be a quantitative effect due to the relative numbers of afferent impulses reaching the hippocampus from different sources, and must be tested in other species of mammals.

ACCUMULATION OF RADIOACTIVE IODINE IN THYROID GLANDS SUBSEQUENT TO NUCLEAR WEAPON TESTS AND THE ACCIDENT AT WINDSCALE

By DR. HAMISH A. ROBERTSON and IAN R. FALCONER
Division of Agricultural Biochemistry, Department of Biological Chemistry,
University of Aberdeen

THE changes in thyroidal content of iodine-131 in grazing animals due to nuclear weapon tests have been shown to be a sensitive method of detecting fall-out of iodine-131 (refs. 1–5). From their observations that a similar concentration of iodine-131 was found in all thyroid glands tested, irrespective of whether they were from carnivores or from herbivores, Gunther and Jones[3] tentatively concluded that the iodine-131 had been absorbed by these animals through the lungs, having been inhaled as an aerosol. Doubt was shed on this suggestion by the results of Van Middlesworth[2], who showed that the concentration of iodine-131 in human thyroids was never more than 0.5 per cent of the maximum observed in cattle. This suggested, in so far as the grazing animal is concerned, that the alimentary tract may be the main route of entry of iodine-131. This was confirmed by Marston[5], who found very little or no iodine-131 in the thyroid gland of cats, dogs and rats at a time when the concentration of iodine-131 in herbivora grazing on pasture in the same region was high Stall-fed sheep had an activity of less than 0 1 per cent of the activity of grazing sheep

In this report, values for the iodine-131 content of the thyroids of sheep grazing in north-east Scotland are given These values cover the period November 1957–July 1959 Values for deer thyroid glands from north-east and from north-west Scotland and for human thyroids from the London area have been obtained during the period December 1958–March 1959 Shortly after the accidental release of iodine-131 from Windscale No 1 pile on October 10, 1957, sheep thyroid glands were obtained from the Cumberland area during the period October 1957–March 1958

All the measurements of activity reported were made using a commercial scintillation detector fitted with a 2½-in well-type crystal By the addition of an extra 2 in of lead to the top and sides of the detector, the background radiation count was reduced to approximately 500 counts per 100 sec When the detector was calibrated with a standard iodine-131 solution, it was found that 5 0 × 10^{-12} c gave a count-rate sufficiently high to be statistically greater than background, at 95 per cent probability All estimates made were determined by measuring the time taken for 10,000 counts , hence the standard deviation of all counts will be constant

An initial sample of sheep thyroid glands was collected at local abattoirs from sheep of known origin, trimmed free of connective tissue, weighed, homogenized and the count-rate determined on both lobes separately These thyroids were recounted at weekly intervals over a period of a month The half-life of the gamma-activity was found to be 8 0 ± 0 1 days and the decay curve, plotting the logarithm of activity against time, was linear and parallel to that of pure iodine-131 It was found that the presence of muscle tissue did not significantly affect the counter calibration with reference to iodine-131, so that the thyroid content of iodine-131 could be accurately expressed in absolute units, that is, curies All results are expressed in terms of iodine-131 content per gram of fresh weight of thyroid tissue All values are corrected to time of slaughter A statistical analysis of the iodine-131 content of the right and of the left lobe revealed that no difference existed between them (P = 95 per cent) Afterwards, only one lobe was collected from each animal sampled

In order to compare the effect of locality within the general region of north-east Scotland, groups of approximately ten lobes were collected from three batches of sheep from different areas slaughtered on the same day and the iodine-131 content determined The results were

Fyvie	2 91 ± 0 28 × 10^{-10} c /gm	(8 animals)
Oldmeldrum	2 14 ± 0 12 × 10^{-10} c /gm	(10 animals)
Banff	3 34 ± 0 84 × 10^{-10} c /gm	(10 animals)
Overall mean	2 79 ± 0 32 × 10^{-10} c /gm	(28 animals)

There is no significant difference between these groups (0 2$<P<$0 3)

It should be noted that these localities lie more on the coastal belt of north-east Scotland rather than in the more mountainous hinterland This general area, from which the majority of the values to be reported were obtained, has a fairly uniformly distributed rainfall of approximately 30 in a year The main advantage in drawing samples from this area is that it is possible to obtain these samples at regular intervals throughout the year This is not the case with animals from the more mountainous areas with higher rainfall The majority of the flocks sampled were from localities at least ten miles distant from the sea In this region the prevailing wind is south-westerly and therefore off-shore The possibility of sea spray depositing non-radioactive iodine on the pasture during in-shore winds is not considered to have materially affected the results obtained

At certain times of the year it was only possible to obtain the thyroid lobes from fat lambs It was therefore necessary to carry out a comparison between the activity of ewe and lamb thyroid glands The results for one such comparison is given below

Ewe thyroid activity	4 21 ± 0 35 × 10^{-11} c /gm	(16 animals)
Lamb thyroid activity	7 14 ± 0 64 × 10^{-11} c /gm	(8 animals)
Overall mean	5 2 ± 0 42 × 10^{-11} c /gm	

The mean for the activity of the lamb thyroids is significantly higher than that for the ewe ($P <$ 0 01) From other experiments carried out in this laboratory on the thyroid activity in ewes and lambs, it would appear that the difference between the iodine-131 content of their thyroids will vary according to whether the measurement is made during a period of accumulation due to recent fall-out of iodine-131 or during a period when the iodine-131 in the pasture is decreasing The lambs, having more active thyroids than the mature ewes, would accumulate fall-out more rapidly than older animals and also excrete iodine more rapidly The maximum difference is likely to be relatively small, considering that the overall magnitude of change encountered is of the order of one thousand times

In order to obtain some information on what proportion of the thyroid content of iodine-131 could be attributed to absorption through the lungs and ingestion from drinking water, 16 wethers were randomly selected from a flock during a period of relatively low activity, namely, January 1958 Of these animals a group of 8 was brought indoors, where they were kept until slaughter in May 1958, that is, some five months later During this period they were fed on hay and oats harvested during the previous season and kept under cover to preclude contamination by direct fall-out The remaining 8 animals were allowed to run on normal pasture until slaughter Both groups of animals were killed in May 1958 at a time when thyroidal activity due to fall-out in the groups of sheep was known to be high The activity found in the thyroid glands of these two groups was

Stall-fed animals	1 56 ± 2 2 × 10^{-11} c /gm
Grazing animals	2 25 ± 0 13 × 10^{-9} c /gm

The values found for the stall-fed animals are significantly higher than the minimal detectable level and higher than some values obtained from sheep on free grazing during other periods, suggesting that the stall-fed animals had been exposed to iodine-131 by inhalation and from drinking water The hundredfold difference in these values suggests that in so far as the sheep is concerned, the main source of thyroidal iodine-131 is contaminated pasture, something of the order of 0 5 per cent arising from inhalation and drinking water

Having established the validity of the counting and sampling techniques, arrangements were made to carry out regular determinations at approximately fourteen-day intervals The values obtained are presented in Fig 1, which includes histograms indicating the frequency and number of atomic weapon tests and the distribution of rainfall

From the graph it can be seen that the minimal detectable level of 5 × 10^{-12} c /gm is reached 2–3

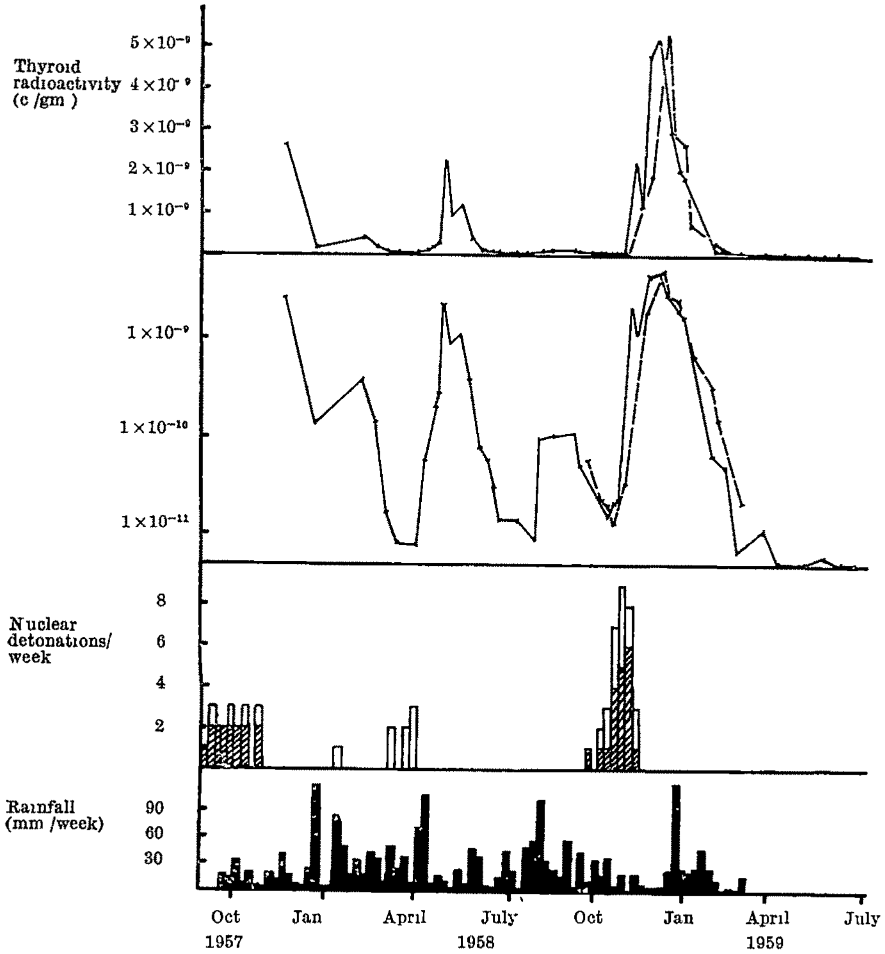

Fig. 1. Variation in thyroid iodine-131 content of sheep in the north-east of Scotland during November 1957–July 1959 with histograms indicating the frequency of nuclear detonations in the northern hemisphere and the rainfall. Nuclear detonations are indicated as shaded (United States tests), unshaded (U.S.S.R. tests)

Superimposed on the upper graphs between September 1958 and February 1959 is the iodine-131 content of deer thyroids collected in north-western Scotland (broken line)

months after a test series. This is in keeping with a half-life of approximately 7 days for iodine-131 in the thyroid of sheep. This value of 7 days takes account of both the biological and the physical half-life of iodine-131 in the thyroid.

It has been supposed that only tests carried out in the northern hemisphere would influence iodine-131 levels in this area. However, it is not possible to relate the increased level found between July and September 1958 with any known northern hemisphere test immediately prior to this period. The Russian series of tests which commenced on February 23 ended on March 21 and did not commence again until September 30. All the American and British tests during the period April 28–August 12 were carried out in the southern hemisphere. It would appear, therefore, that either some unknown release of iodine-131 into the atmosphere took place in the northern hemisphere during this time, or that the debris from tests in the southern hemisphere had been detected in this area.

Towards the end of 1958 arrangements were made to obtain deer thyroids from both north-east and north-west Scotland. The values obtained from these two areas agreed very closely, but since more regular samples were obtained from the north-west, only the values for this area are shown (Fig. 1). Although the variability and standard error are higher for the deer measurements, due in most cases to small numbers in the samples, it would appear that the pattern for sheep and for deer is very similar.

During the period December 1958–January 1959, human thyroid glands obtained at post-mortem in the London area had a mean value of $1·45 \pm 0·37 \times 10^{-11}$ c./gm. (10 individuals), which is approximately 1 per cent of the value found in the lobes of sheep during this period. Since this occurred at a season of the year when fresh vegetables would be scarce, and milking cows would be fed mainly on stored fodder, it is suggestive, when compared with the stall-fed sheep experiment, that inhalation of iodine-131 by the lungs together with iodine-131 absorbed from drinking water represented in the adult human the major route of entry of iodine-131 during this period. The number of human thyroids sampled at any particular period was too small to obtain accurate information regarding how the iodine-131 content of the human thyroids was changing with time in relation to the iodine-131 content of the sheep thyroids.

Calculations of radiation dosage to the thyroids due to both β- and γ-emissions from iodine-131 have been made. These are based on a calculated radiation dosage of 11·2 rads per day per 1 μc. In the Aberdeen area during January 1–December 31, 1958, the calculated radiation dose to the thyroid glands of local sheep was 3·0 rads. During the period December 15, 1958–January 15, 1959, which is approximately six weeks after a series of twenty-nine atomic and hydrogen explosions in the northern hemisphere, the thyroid radiation dose due to iodine-131 has been calculated for sheep from north-east Scotland, deer from north-west Scotland and for humans from the London area. These values are:

Sheep	0·32 rad
Deer	0·31 rad
Human	$5·9 \times 10^{-3}$ rad

It must be emphasized that since the number of human thyroids sampled was small, the value calculated for the human cannot be taken as more than an approximation.

Sheep thyroid glands were collected in the Windscale area following the reactor incident on October 10, 1957. During the period October 26, 1957–March 13, 1958, thyroid glands were obtained from 77 sheep The first sample was from sheep killed on October 26, by which time the shorter lived isotopes of iodine would have decayed away Half-life determinations were done on the gamma-activity of the thyroids, the half-life being 8 1 days and the logarithmic decay curve linear with time A fairly wide scatter of values was obtained due to the sheep sampled coming from farms in different directions and distances from the Windscale pile

The highest values obtained were from four sheep killed on November 10, that is, 31 days after the release These animals had been obtained from two neighbouring farms situated 3,000 and 5,000 yd respectively south-south-east of Windscale This was within the area of maximum deposition[5] Their thyroids had a value of 2 0 ± 0 03 × 10^{-6} c iodine-131 per gm Further samples were obtained from this locality on November 27, 1 5 × 10^{-7} c per gm (2 animals), and on March 13, 1958, when a value of 2 2 ± 0 43 × 10^{-11} c per gm (14 animals) was obtained These three values gave a good fit to an exponential curve of half-life 7 3 days This compares with a mean half-life of 7 0 days (18 animals) obtained experimentally in this laboratory

An attempt has been made to obtain an approximate value for the radiation dose received by the thyroids of the sheep in the above locality Experiments carried out in this laboratory have shown that, following the administration of a single dose of iodine-131 to sheep, the maximum activity in their glands is attained at a mean of 3 7 days (20 animals) A value of four days has therefore been taken as the shortest time to reach maximum activity in the thyroids of the Windscale sheep This of course erroneously assumes that all the activity is washed off the pasture by rain after the first day Under ideal conditions, that is, when no activity is lost from the pasture other than by physical decay, the accumulation of iodine-131 in an animal would follow the equation

$$X = X_0 t \exp(-t)$$

where X is iodine-131 in the thyroid at time t; X_0 is iodine-131 originally deposited on the amount of fodder eaten in a day by an animal, decay constant of iodine-131, 0 0866

This equation gives a maximum value when $t = 12$ days A value of 12 days has therefore been taken as the longest time required to reach maximum activity in the thyroids of the Windscale sheep An exponential curve of half-life 7 3 days was drawn through the observed points and the radiation dose to the thyroid calculated over a period of three months following the release Assuming the time of peak activity of the glands to be four days after release, the radiation dose to the thyroid gland is approximately 4,500 rads, and assuming a peak activity at 12 days the dose is approximately 2,800 rads It is thought that a value between 3,000–4 500 rads represents a fair estimate of the radiation dose received by the thyroids of these animals It can be calculated from the activity of the sheep thyroids in the Aberdeen area over this three-month period that only 1 5 rads can be attributed to fall-out

Little information is available regarding the radiation dose required to produce abnormalities in sheep thyroid glands The experiments of Bustad *et al* [7] suggest that changes in thyroid activity occur following the administration of a radiation dose of 5,000 rads over a period of six months

This investigation was made possible by a grant to one of us (H A R) from the Medical Research Council We are indebted to Dr E E Pochin for obtaining the human thyroids, to N Craig for the Windscale sheep thyroids and to D J MacPherson and D M Dowell for the deer thyroids

FORMATION OF DIFFERENT CELL–VIRUS RELATIONSHIPS IN TUMOUR CELLS INDUCED BY POLYOMA

By Dr LEO SACHS and ERNEST WINOCOUR
Department of Experimental Biology, Weizmann Institute of Science, Rehovoth, Israel

THE polyoma virus can induce tumours in mice, hamsters, rats and rabbits[1-4] With the development of a plaque assay for this virus[5], it has become possible to undertake quantitative studies on cell–virus relationships and to produce genetically pure lines of virus The use of such lines has shown that single-plaque isolates can induce multiple tumours in different species (ref 5 and unpublished work) An experimental system is thus available for the study of a variety of mammalian tumours induced by the same virus, and the present article is concerned with experiments that demonstrate the existence of strikingly different cell–virus relationships in different tumours induced by polyoma

The plaque assay, and hæmagglutination, were carried out as previously reported[5,6] The growth medium for cell cultures consisted of 0 5 per cent lactalbumin hydrolysate in Earle's saline and 20 per cent horse serum

In the first experiment, release of virus from seven mouse tumours induced in six mice (4 parotid tumours, 2 mammary adenomas and 1 kidney sarcoma) was determined by placing the cells in culture and testing the hæmagglutination titres of the culture fluid at various intervals For each tumour, 5 × 10^6 tumour cells dispersed in trypsin were plated in 50-mm Petri dishes with 4 ml of culture medium, and the entire medium was changed,

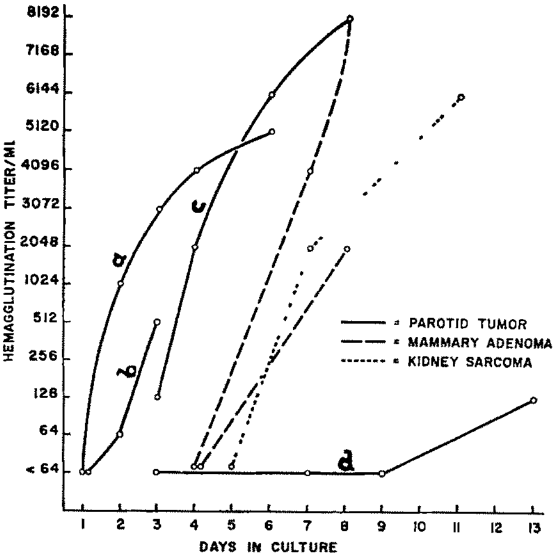

Fig 1 Release of virus from mouse tumour cells in culture The results are expressed as cumulative hæmagglutination titres per ml of tissue culture fluid, (*a*) *MP* 2, (*b*) *MP* 6, (*c*) *MP* 3, (*d*) *MP* 11

and tested for hæmagglutination titre, on the days shown as points on the curves (Fig 1) The titre obtained on a particular day has been added to the total of the previous titres, and the results are expressed as cumulative titres per millilitre of culture fluid Titres less than 64 per ml were not added to the cumulative results, since these were equivalent to the control value found for normal tissue culture fluid

The results (Fig 1) show that the release of virus in these cultures varies considerably even in different tumours of the same type The histology of the tumours and the appearance of the cells in culture make it unlikely that these differences in release of virus are merely due to possible differences in the proportion of normal cells in the various tumours

The results in Fig 1 also indicate that in all the mouse tumours tested there was a 'lag' period before high hæmagglutination titres were obtained from the cells in culture, and that the length of this 'lag' period varied in different tumours Since extracts of mouse tumours contain heat-labile inhibitors and high antibody titres[6], tests were made for the presence of inhibitors and antibodies during the 'lag' period These tests all gave negative results, so that differences in the 'lag' period may be due to difference in rates of synthesis of virus and/or release of virus

In order to determine the proportion of cells that release virus, cells from three parotid tumours, *MP* 10, *MP* 11 and *MP* 4, were plated on mouse embryo monolayers (*MP* 4 when plated alone gave hæmagglutination titres of 1,024–2,048 per ml a day, from the second day in culture, and *MP* 10 a titre of 512 ml during a three-day period from the second to the fifth day in culture) The proportion of cells releasing virus was determined by the relationship between the number of tumour cells plated and the number of plaques The results (Table 1) show that one of the factors in the difference in release of virus from cultures of these tumours can be a difference in the proportion of cells that release virus

Mouse tumours can thus release variable but considerable amounts of virus In a total of sixteen tumours tested, from fifteen mice, virus was obtained from every tumour This is not the case in tumours induced by polyoma in other species

Table 1 PROPORTION OF CELLS RELEASING VIRUS IN MOUSE PAROTID TUMOURS

Tumour	No of tumour cells seeded per plate	No of plates	Average No of plaques	Cells releasing virus
MP 4	125	5	101	1 in ~ 1
MP 10	400	2	98	1 in 4
	1,200	3	2	
MP 11	6,000	8	8	1 in 600–
	30,000	3	28	1 in 1,000

The sarcomas induced in hamsters, and the fibromas (that eventually regress) induced in rabbits, are hard tissues, and good cell suspensions have so far not been obtained from them Fourteen tumours from ten hamsters (7 subcutaneous sarcomas, 3 kidney sarcomas, and 4 heart sarcomas) have been tested for release of virus by placing minced pieces of tissue in Petri dishes either by themselves or on normal mouse embryo monolayers No hæmagglutination titres higher than the control value for normal tissue culture fluid were found in the fluid of any of these cultures after 13 days, and second-passage cultures of six of these tumours have also given no hæmagglutination titres after 14 days The fluids from eight tumours cultured for 13 days on mouse embryo monolayers were tested by the plaque assay, and of these seven gave no plaques, and one, a subcutaneous sarcoma, gave 180 plaque-forming units per ml during a release period of six days. In the fourteen hamster tumours tested there was thus no, or almost no, release of virus from the tumour cells The release of infectious virus is thus not necessary for the maintenance of malignancy

Two rabbit fibromas from two rabbits were studied by placing minced pieces of tumour on mouse embryo monolayers One tumour gave no hæmagglutination titre even after a second and a third passage of 14 days each The other tumour gave no hæmagglutination titre in the first passage of 14 days, and a titre of 64 after 11 days in the second passage. The virus isolated from this rabbit has produced tumours in hamsters

In rats, polyoma induces a high frequency of kidney sarcomas, especially after intracerebral inoculation[4], and these tumours give good cell suspensions by trypsinization As with mice, 5×10^6 tumour cells were seeded with 4 ml of medium, and the results for release of virus from four rat kidney sarcomas from four rats, cultured for periods ranging from 9 to 21 days, are shown in Table 2 No significant hæmagglutination titres were obtained in any of these cultures, and a plaque assay of the culture fluids has shown that at various times there was either no, or very low, release of virus In contrast to a titre of 2.8×10^6 plaque-forming units per ml. during a release period of 2 days obtained from mouse kidney sarcoma cells, the highest titre obtained from the rat kidney sarcoma cells was

Table 2 RELEASE OF VIRUS FROM RAT KIDNEY SARCOMA CELLS IN CULTURE

Tumour	Total plaque-forming units per ml	Release period (days)
RK 1	20	9
RK 2	160	13
RK 3	90	17
RK 4	640	21

6 × 10^2 plaque-forming units per ml. during a release period of 3 days. Tests for inhibitors and antibodies in the rat culture fluids (and in the fluids from hamsters and rabbits) all gave negative results. Virus isolated from the rat sarcomas has produced tumours in hamsters.

Rat sarcoma *RK* 2 was further tested by determining the numbers of plaques produced by tumour cells placed on mouse embryo monolayers (4 plates per cell dilution). No plaques were obtained even with an inoculum of 10,000 cells. Thus a very small proportion of cells in the rat tumours (less than 1 in 10,000 in *RK* 2) release virus. It should be mentioned that *in vitro* infection of normal monolayers has shown that in contrast to the high rate of virus multiplication in mouse tissues, there appears to be no, or very little, multiplication of the same virus stock in monolayers of hamster, rat and rabbit cells.

The above experiments show that a genetically homogeneous line of polyoma virus can induce the formation of various tumours with different rates of release of virus, and in some tumours no release at all. It is significant that both for the Rous sarcoma[7] and for the Shope papilloma virus[8] it has also been shown that it is possible to induce either tumours from which virus can be readily recovered or tumours from which little or no virus can be extracted. The possibility of virus induction from a pro-virus state, the existence of immunity to super-infection, and the behaviour of single-cell clones of tumour cells releasing virus and not releasing virus is being studied. For such investigations the polyoma virus provides an unusually favourable system, since a plaque assay for the virus has been developed (the existence of non-infectious incomplete particles can be determined by hæmagglutination), and tumour cells with widely different cell–virus relationships, can be readily and regularly established and studied in culture.

We are indebted to the Winfield Baird Foundation for a grant in support of this work.

EXPERIMENTAL DEMONSTRATION OF AN INTERNAL RHYTHM OF REPRODUCTION IN A TRANS-EQUATORIAL MIGRANT (THE SHORT-TAILED SHEARWATER *PUFFINUS TENUIROSTRIS*)

By DR. A. J. MARSHALL
Department of Zoology and Comparative Anatomy,
St. Bartholomew's Hospital Medical College,
University of London

AND

DR. D. L. SERVENTY
Commonwealth Scientific and Industrial Research,
Organization, Western Australia Regional Laboratory, University of Western Australia, Perth

THE trans-equatorial migration of the short-tailed shearwater or Australian 'mutton-bird' has been described and mapped by Serventy[1] (Fig. 1). Marshall and Serventy[2] further showed that the migratory flocks regularly leave their southern Australian breeding islands in April (autumn) at a time when their principal food—euphausian plankton—remains abundant, and when sea temperatures are still higher than at the November period of ovulation. It was concluded that the post-nuptial northern journey via Japan to the Aleutian and South Arctic contra-nuptial ('wintering') areas is probably in obedience to an inherent internal rhythm.

When the millions of birds first make their landfall at the breeding islands in the last week in September (spring) gametogenesis is already well advanced. The testes contain bunched spermatozoa. There is no doubt that both the spring sexual cycle and the southern journey are initiated under conditions of decreasing day-length while the birds are still north of the equator. However, the astonishing regularity of their Australian landfall and subsequent egg-laying (November 19–21 and the following 12 days) seemed to suggest that the nuptial journey must be 'timed' by some astronomical constant, possibly decreasing day-lengths. No obvious periodic changes that might operate as precise 'timing' factors were observed in the breeding area.

P. tenuirostris, in common with certain other long-distance migratory shearwaters, moults on the head and body shortly after egg-laying, but delays the replacement of its wing and tail quills until the completion of the exacting journey across the equator[3]. Like most other migrants the species lays down massive deposits of subcutaneous and peritoneal fat before migration.

The primary purpose of the present investigations was to try to determine whether decreasing day-length, or internal rhythm, controls the sexual cycle (and possibly, therefore, the migration). Secondly, it was desired to discover whether the peculiar moult rhythm would persist under varying stimuli. Thirdly, it was considered valuable to record the degree of fat deposition under such varying conditions in captivity.

A group of breeding adults was caught in the Furneaux group of islands in north-east Tasmania (lat. 40° 12′ S.) just before the beginning of the northward migration of 1957. They were sent by air to the Commonwealth Scientific and Industrial Research Organization Regional Laboratory at Perth, Western Australia (lat. 32° S.), and held in captivity for several months during the period they would normally spend in the North Pacific (see Fig. 1). It was found that after some initial losses those essentially plankton feeders could be maintained on a

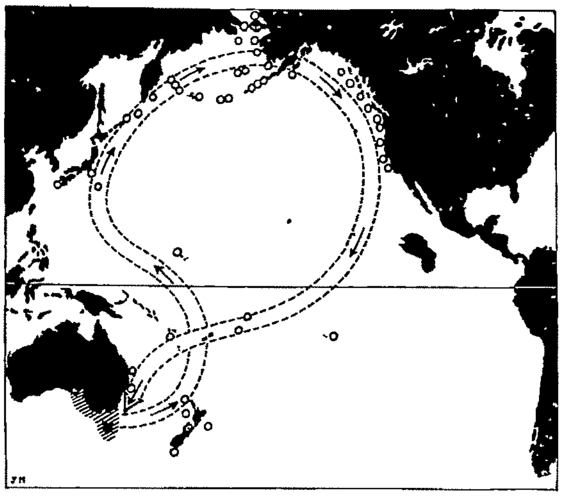

Fig 1 Generalized migration route of *Puffinus tenuirostris* The rings indicate localities of collected specimens Arrows indicate the direction of migration The breeding area is shown by means of parallel lines

diet of sliced fish Experiments were conducted during two successive years

Observations in 1957

The birds were divided into two groups of 15 individuals each The first lot was placed under a changing light regime approximating the day-lengths to which travelling wild migrants should be exposed, except that the total period was telescoped by half Thus, whereas the migrating flocks leave the breeding islands about mid-April and arrive back late in September, the artificial photo-periods in this experiment (successively equalling those of the equator, Japan, the Aleutians, the equator and finally the breeding localities) were so adjusted that the normal day-length of September 27 was reached on June 27

The second group of birds was held under natural Perth daylight (which is longer at the June solstice by about an hour than at the breeding islands used by the species but almost 10 hr shorter than at the Aleutians) Some of the birds from both cages were killed on June 27 The photostimulation experiment was then terminated and the survivors of both groups held in company, under ordinary Perth daylight, until September 29

(*a*) *Gonad condition on June* 27 Despite the striking differences in the light regimes of the two groups of birds, there was no detectable difference in their gonads Males of *both* groups showed some very slight advancement from the April condition and those that died during the first fortnight of the experiment Thus, the seminiferous tubules of some birds contained up to three rows of spermatogonia The diameter of ovarian oocytes in the single female killed was slightly greater than the April condition

(*b*) *Gonad condition on September* 29 Four birds survived to this date Of three males, one (originally from the photo-stimulated group) contained spermatozoa in some seminiferous tubules Of the other two males (originally from the natural day-length cage) one was even more advanced, having bunched spermatozoa The third male contained numerous primary spermatocytes in mitosis and a few secondary spermatocytes The overall size of gonad was slightly, but definitely, smaller than normal wild birds at the corresponding time A surviving female (originally from the photo-stimulated group) had the diameter of the largest oocyte measuring 3 1 mm , that is, within the range of normal wild birds at the time of land-fall

It was clear, then, that alteration of photoperiodicity, in the manner conducted in the experiment, had no great effect on the captive shearwaters The birds—both experimental and control—that were allowed to survive came rhythmically into a sexual condition only a little less advanced than that of the wild population by the date that the latter completed their trans-equatorial migration around the Pacific

Observations in 1958

The experiment was repeated with newly caught adults from the same breeding stations Again they were divided into two groups Half as before were kept under conditions of natural Perth daylight The other half were retained under a constant 12 hr illumination This is the day-length at the breeding islands about the time of the exodus migration This year birds were held until the period of normal landfall, when the survivors were killed and dissected on September 29 Three males and three females survived in the artificially lighted cage and seven males and two females in the natural light enclosure

Again there was no appreciable difference in the sexual condition between the birds in the two cages As before, all birds showed some gonad modification, and in some individuals testis development had almost, but not quite, reached the stage attained by normal wild birds at the corresponding time Four out of the ten males had produced spermatozoa, and the remainder contained primary and sometimes secondary spermatocytes The range of overall size reached that of the wild population, but the mean size was significantly below it Ovarian development was also slightly advanced and the largest diameters of oocytes (mean, 2 1 mm) were slightly inferior to them in normal birds at the corresponding stage

Wing and tail moult began in late June and July, but the moult was protracted and its completion retarded by comparison with that of wild birds Both groups of captives put on appreciable depot fat (corresponding to 'pre-migratory' fat) from mid-August onwards, reaching a maximum in early September The weight trends were identical in the two groups

In summary, these investigations show that in this migratory shearwater the breeding rhythm is persistent at least for one year after the animal is taken out of its normal environment and exposed to external influences (photo-period, temperature, food and habitat) exceedingly different from normal Although gametogenesis, wing moult, and pre-migratory fat deposition took place under these conditions at approximately the normal periods, there was nevertheless in some individuals a considerable asymmetry of the seminiferous tubules and a pronounced retardation of spermatogenesis that is never encountered in the wild population This suggests that internal events were tending to drift out of phase with the external environment and that essential (as yet undetermined) external influences, possibly including behaviour, were lacking

The experiments are continuing

FORTHCOMING EVENTS

(*Meetings marked with an asterisk * are open to the public*)

Monday, December 14

INSTITUTION OF ELECTRICAL ENGINEERS (at Savoy Place, London, W C 2), at 5 30 p m —Discussion on "Why Hi-Fi ?", opened by Mr P P Eckersley

SOCIETY OF CHEMICAL INDUSTRY, PESTICIDES GROUP (at 14 Belgrave Square, London, S W 1), at 5 30 p m —Mr P B Cornwell 'Insect Control by Gamma Irradiation"

ROYAL GEOGRAPHICAL SOCIETY (at 1 Kensington Gore, London, S W 7), at 8 30 p m —Baron G de Gerlache de Gomery "The Belgian Antarctic Expedition"

Tuesday, December 15

INSTITUTE OF MARINE ENGINEERS (at the Memorial Building, 76 Mark Lane, London, E C 3), at 5 30 p m —Mr K Maddocks "Some Aspects of Marine Reactor Security"

INSTITUTE OF PHYSICS (at 47 Belgrave Square, London, S W 1), at 5 30 p m —Mr K G Freeman "Tubes for Colour Television"

INSTITUTION OF ELECTRICAL ENGINEERS, MEASUREMENT AND CONTROL SECTION (at Savoy Place, London, W C 2), at 5 30 p m —Discussion on 'Data Handling Problems in Atomic Installations", opened by Dr D Taylor

Wednesday, December 16

POWDER METALLURGY JOINT GROUP OF THE IRON AND STEEL INSTITUTE AND THE INSTITUTE OF METALS (in the Hoare Memorial Hall, Church House, Great Smith Street, London, S W 1), at 9 30 a m —Symposium on 'The Powder Metallurgy of Magnetic Materials'

GEOLOGICAL SOCIETY OF LONDON (at Burlington House, Piccadilly, London, W 1), at 5 p m —Prof P B Ackermann and Prof F Walker "Vitrification of Arkose by Dolerite near Heilbron, Orange Free State"

ROYAL METEOROLOGICAL SOCIETY (at 49 Cromwell Road, London, S W 7), at 5 p m —Dr H Wexler "Seasonal and other Temperature Changes in the Antarctic Atmosphere", Mr W Hitschfeld "Patterns of Hailstorms in Alberta"

ROYAL STATISTICAL SOCIETY (at the London School of Hygiene and Tropical Medicine, Keppel Street, Gower Street, London, W C 1), at 5 15 p m —Sir Hugh Beaver, K B E "Statistics as a Tool of Management" (Presidential Address)

INSTITUTE OF PETROLEUM (at 61 New Cavendish Street, London, W 1), at 5 30 p m —Mr A C Hartley "Pipelines'

INSTITUTION OF MECHANICAL ENGINEERS (at 1 Birdcage Walk, Westminster, London, S W 1), at 6 p m —Dr S G Hooker "The Future of Air Breathing Engines in Aviation" (James Clayton Lecture)

SOCIETY OF CHEMICAL INDUSTRY, CORROSION GROUP (at 14 Belgrave Square, London, S W 1), at 6 p m —Discussion of Research Papers recently published by Members of the Group

SOCIETY FOR ANALYTICAL CHEMISTRY, MICROCHEMISTRY GROUP (at "The Feathers", Tudor Street, London, E C 5), at 6 30 p m —Discussion on "Applications of the Flask Combustion" opened by Miss M Corner and Mr C B Dennis

SOCIETY OF INSTRUMENT TECHNOLOGY (at Manson House, 26 Portland Place, London, W 1), at 7 p m —Mr J F Coales "Random Inputs and Load Variations"

Thursday, December 17

BRITISH COMPUTER SOCIETY, LONDON BRANCH (at the Northampton College of Advanced Technology, St John Street, London, E C 1), at 2 30 p m —Discussion on "Conversion between Analogue and Digital Representation"

SOCIETY OF CHEMICAL INDUSTRY, ROAD AND BUILDING MATERIALS GROUP (at 14 Belgrave Square, London, S W 1), at 2 30 p m and 5 30 p m —Scientific Papers

INSTITUTION OF MINING AND METALLURGY (at the Geological Society, Burlington House, Piccadilly, London, W 1), at 5 p m —Dr A J Robinson 'Relationship Between Particle Size and Collector Concentration" Mr D Borchers "Deepening of No 1 Vertical Shaft at Premier (Transvaal) Diamond Mining Co , Ltd "

LONDON MATHEMATICAL SOCIETY (at the Royal Astronomical Society, Burlington House, Piccadilly, London, W 1) at 5 p m —Prof E V Schenkman "Supersolvable Groups"

INSTITUTION OF ELECTRICAL ENGINEERS, EDUCATION DISCUSSION CIRCLE (at Savoy Place, London, W C 2), at 6 p m —Discussion on 'The Presentation of the History and Philosophy of Science", opened by Prof H Dingle

Thursday, December 17—Friday, December 18

PHYSICAL SOCIETY (in the Townsend Lecture Theatre, The Clarendon Laboratory, Oxford), at 10 a m daily—Conference on "Electron-Phonon Interaction in Solids"

Friday, December 18

SOCIETY OF CHEMICAL INDUSTRY, FINE CHEMICALS GROUP (at 14 Belgrave Square, London, S W 1), at 6 30 p m —Dr F E Camps "Some Aspects of Forensic Science"

Friday, December 18—Saturday, December 19

BRITISH PSYCHOLOGICAL SOCIETY (at University College Gower Street, London, W C 1) Conference

Saturday, December 19

BIOCHEMICAL SOCIETY (in the Department of Chemical Pathology, King's College Hospital Medical School, Denmark Hill, London, S E 5), at 10 30 a m —389th Meeting

APPOINTMENTS VACANT

APPLICATIONS are invited for the following appointments on or before the dates mentioned

KNOOP RESEARCH FELLOW (graduate in medicine or science), to work on cerebral enzymatic aspects and on the presence of chemical abnormalities in hereditary degenerative cerebral conditions—The Secretary, Institute of Neurology, The National Hospital, Queen Square, London, W C 1 (December 18)

LECTURER or ASSISTANT LECTURER IN GEOGRAPHY at Makerere College (University College of East Africa)—The Secretary, Inter-University Council for Higher Education Overseas, 29 Woburn Square, London, W C 1 (December 30)

ASSISTANT LECTURER or LECTURER IN PURE MATHEMATICS, and an ASSISTANT LECTURER or LECTURER IN MATHEMATICAL STATISTICS —The Secretary, The University, Exeter (December 31)

LECTURER (preferably with an interest in the theory of machines, mechanical servomechanisms or the strength of materials) IN MECHANICAL ENGINEERING—The Secretary, The Queen's University, Belfast (January 1)

PROFESSOR OF APPLIED MATHEMATICS—The Secretary and Registrar, University College of North Wales, Bangor, North Wales (January 1)

LECTURER or ASSISTANT LECTURER IN CHEMISTRY at the University of Malaya (Singapore Division)—The Secretary, Inter-University Council for Higher Education Overseas, 29 Woburn Square, London, W C 1 (January 15)

ASSISTANT LECTURER IN STATISTICS, to teach theoretical statistics and some mathematics—The Secretary, The London School of Economics and Political Science, Houghton Street, Aldwych, London, W C 2 (January 22)

ASSISTANT (preferably with some knowledge of horticulture and experience in proof correcting and indexing) TO THE EDITOR—The Secretary, The Royal Horticultural Society, Vincent Square, London, S W 1, marking envelope "Confidential"

CHEMIST or AGRICULTURAL CHEMIST (with an honours degree in science or equivalent qualification, and preferably postgraduate research experience to Ph D level and a knowledge of agriculture) to undertake research on the quality of protein in animal feeding stuffs for non-ruminants—The Secretary, The Rowett Research Institute, Bucksburn, Aberdeen

CHEMIST or BIOCHEMIST, for research in the steroid field—The Director, Group for Research on the Chemical Pathology of Steroids, Jessop Hospital for Women, Sheffield 3

LECTURER (honours graduate in mathematics or mathematical physics) IN THE DEPARTMENT OF MATHEMATICS (including Industrial Statistics and Computing)—The Registrar, College of Technology and Commerce, Leicester

PHYSICIST (with research experience to Ph D standard in infra-red spectroscopy), to undertake a programme of investigations in atmospheric radiation—Imperial College, Department of Meteorology, London, S W 7

RESEARCH ASSISTANT (with a good mathematical background including statistical analysis, and preferably some knowledge of the field of metal fatigue) IN THE DEPARTMENT OF AERONAUTICS AND ASTRONAUTICS, to undertake work on the theory of cumulative damage in fatigue—The Secretary and Registrar, The University, Southampton

SENIOR TECHNICIAN or TECHNICIAN IN THE DEPARTMENT OF GEOLOGY—The Bursar, The University, Sheffield 10

FUTURE OF BROADCASTING AND TELEVISION

THERE are few more important questions for mankind to-day than that of the creative use of the mass media, and recent evidence of the abuse or wasteful use of television or of broadcasting only accentuates the urgency of determined efforts to discover effective ways of using the immense powers of these media over the minds of men and women and young people for creative and positive purposes. The urgency of this problem was well indicated by Alderman F. J. Stott, of Plymouth, speaking on the public library as a major instrument of education, in an address to the Library Association at its annual conference in September. Alderman Stott stressed indeed rather the threat to the balanced development of the individual members of our society under present conditions, and it was Prof. L. Hogben who referred to the immense positive possibilities of the wise and imaginative use of both sound broadcasting and television in solving some of our current educational problems, especially those arising out of the shortage of teachers.

It was accordingly a timely and public-spirited act on the part of *The Twentieth Century* to devote the whole of its November issue to the subject of television in Great Britain, with the declared object of elucidating ways in which television could be put to creative use. Comparatively few constructive suggestions emerge, in fact, from a series of highly interesting articles, among which those of Dr. J. Trenaman, Mr. Gordon McLachlan and Mr. Ed Murrow stand out; but the articles certainly illumine the main issues which are urgent to-day. That is also true of Mr. Norman Collins's discussion of "Minorities and Monopolies", but his article appears to have been provoked by Mr. H. Carleton Greene's address to an association of German business men on the threats which political and commercial control offer to broadcasting: provoked almost to the point of obsession, Mr. Collins is betrayed into too many loose and dubious assertions.

Not the least valuable contribution, however, is the introductory editorial note, which makes an important point that, as is duly noted, the British Broadcasting Corporation itself cannot urge: while the B.B.C. for many years has been changing its approach and no longer seeks to impose what it thinks good, appreciating that there is a much wider range of good things than it once believed and offering to share them with those who want them, it has, in its turn, set standards of balance and taste to which commercial television has had, in part, to conform. Nevertheless, while the Corporation's task is to provide a balanced output of opinion, information and entertainment, and to cater for important minorities as well as the majority, there is a large public which looks to television solely for light entertainment. A serious programme accordingly loses for the B.B.C. much of its audience if its rival is showing something lighter; and if the B.B.C. lost its mass audience, if it was content merely to cater for the serious minority, viewers would ultimately resent paying for a service that was not catering for them.

This situation may well account for whatever confusion or hesitancy may seem to characterize B.B.C. policy; but no Government would stand out against public feeling or could be trusted to subsidize the B.B.C. from general government funds, and for that reason it is suggested that the B.B.C. needs now an additional channel so that it can cater for minority and majority interests throughout the entire broadcasting day. In its latest annual report the Corporation again pleads for a third television channel to be under the control of the Corporation, and claims that two B.B.C. television services could be so planned that the viewer always had a choice at any time of the evening between lighter and more substantial fare. While it can be fairly claimed that in 1958–59 the B.B.C. in such relatively serious but lively television programmes as "Panorama" and "To-night" has set a standard that can do much to enhance man's understanding of the world and his enjoyment of it, there is substance in the argument that a third television network should be allocated neither to the B.B.C. nor to the Independent Television Authority, but to a number of regional corporations, the controllers of which have no direct financial stake in the size of their audiences and who should seek to represent the people of their regions.

Mr. McLachlan's article, "The Gold Mine of Commercial Television", displays fairly enough the issues raised in commercial television and the nature of the choice that will confront the nation when the financial arrangements fall due for revision within the next five years. Mr. McLachlan suggests that the Committee of Public Accounts, in its third report for the session 1958–59, foreshadows radical proposals from the policy makers of both main political parties. He is a little uneasy as to the extent to which the public interest is likely to be served, but he sees signs that the profit motive has already lost something of its dominance and has been replaced by that of prestige, which should certainly be more sensitive to damage by abuse.

The difficulty in dealing with commercial television is not that it is concerned primarily with making profits, but the kind of popularity to which the making of those profits is geared. It may be unfair to suggest that the British Broadcasting Corporation is better than the Independent Television Authority because it does not have to make a profit; but it, too, is inhibited from frightening or jolting its audience. It shirks fundamental controversy and when it speaks for Britain its voice must generally be the voice of a broad consensus When Mr Collins claims that the fears of most of those who opposed the setting up of an alternative Independent Television system have proved groundless, it is difficult to take him seriously, and, for all his fierce opposition to Mr Carleton Greene's wish to exclude business as well as political interests from any say, direct or indirect, in the control of broadcasting, he completely fails to show that the Independent Television system is in any true sense a public service system, or that it expresses any more fully than the B B C the nation's activities as a whole

To be aware of such dangers is one thing, to determine how best to avoid them is quite another, and for positive suggestions one must turn rather to Dr Trenaman's survey of the effects of television, to Prof Asa Brigg's article, "The Image and the Voice", to Mr M Richardson's "Best and Worst of Inventions", or to a paper read by Dr W Belson at the British Association meeting at York Prof Briggs shows, for example, how much is now being done to put television in its correct place in society and in relation to the other mass media Accurate assessment here is essential if television and sound broadcasting are to be used constructively and to the greatest advantage That is why Dr Belson's work on the effects of television upon the interests and initiative of adult viewers is important

In his paper at York, Dr Belson, from studies on B B C television, showed that television reduces the frequency of occurrence of viewers' acts of initiative and also their interests in terms both of strength of identification and level of activity Both in initiative and in interests the loss is at first substantial, but thereafter a recovery sets in which is almost complete after about five years For a good time to come the total loss to the community is likely to be substantial, but there are exceptions, and Dr Belson suggests that study of these exceptions may be rewarding both from a cultural and a commercial point of view

The importance of free experiment at this stage in order to discover the full potential contribution which television may be able to make to culture, to education and to social welfare in any true sense can scarcely be over-stressed, and any decisions taken in the next five years should be such as to ensure that those to whom television—and also sound broadcasting—is entrusted are given full freedom to experiment and ample resources to do so No sectional interest should be permitted to occupy a position which could frustrate or distort such developments, and once again the critical importance of the third network should be apparent Any changes or new arrangements should be such as to secure as far as is humanly possible the dominance of the public interest and the conception of public service

Perhaps the outstanding feature of this symposium of articles on television is the evidence it provides both of the immense financial interests at stake and of the little that is yet known regarding the constructive use of television Dr Trenaman directs attention, for example, to the premature assumption that television can communicate ideas to a much larger public than other media, and to the fact that the measured social effects of television are a good deal less spectacular than one might suppose Nevertheless, they can be serious enough We cannot altogether discount the tendency to insulate the viewer from the realities of the world in which we live, which Mr Ed Murrow finds so alarming a feature of the American system, and if Dr Trenaman can point to numerous lines of profitable investigation, there is also much work still to be done on the technique of using television and indeed sound broadcasting, some of which could well lead to results demanding some curb on the manner in which advertising is conducted at present

This work should not be left solely to the universities or to independent foundations, such as the Nuffield Foundation As Mr Richardson points out, both a lead and support could and should be given by the Government in order to enable the educational potentialities, for example, to be realized and some order established The work already carried out by Dr Trenaman has established beyond question the supreme importance of education here Ultimately, the use that is made of television or sound broadcasting depends on the standards of education of the mass of the population, and that must not be forgotten in considering what contribution the new mass media can make to the removal of difficulties arising out of particular current—if possibly temporary—problems such as the shortage of teachers of science But if we are to use television and broadcasting wisely and effectively, either politically or culturally, as a means towards education we must know a great deal more about how to convey ideas and about the interactions of sound broadcasting, television and the other mass media—their limitations as well as their potentialities

There is, however, one aspect of the work of the British Broadcasting Corporation which is virtually ignored in the symposium published in *The Twentieth Century*, and yet it is the one where the loss of the Corporation's monopoly and its restriction to one television channel could have the most serious effects, even if the Government's new policy in regard to overseas information services may now remove the danger of financial stringency It could be questioned whether the external services of the Corporation could maintain its deservedly high reputation for objective and honest reporting of news if, for any reason whatever, the Corporation as a whole lost or impaired its reputation for telling the truth That is just what could follow if the particularly close co-operation and interrelation between the Government and the Corporation were once disturbed, either in respect of the external services or of other services

That relation is, of course, based on mutual good will and respect, and both sides—the Government and the Corporation—have a vested interest, as Mr James Monahan recently emphasized, in keeping viable the relation between the "editorially responsible External Services" and the co-operative, financially responsible "prescribing departments" Clearly the system seems to work, and to produce the genuine "voice of Britain", and it is well to pause before agreeing on any changes in the relations between the British Broadcasting Corporation and the Government which might jeopardize such an asset Objective reporting and editorial independence from the Government are not easily retrieved once sacrificed, and though the Overseas Services are only beginning to use television, too much care can scarcely be taken to avoid damaging such precious assets, or placing new obstacles in the way of their utilization, when shaping the conditions or the techniques under which the new and different powers of television are to be used Once the fairness and impartiality of a broadcasting system becomes suspect its authority as a source of information is destroyed, and quite apart from any short-term or long-term effects which either sound broadcasting or television may have on its constant listeners and viewers, Mr Carleton Greene's warning is endorsed by all that has happened in the broadcasting field since his lecture was given last April.

REVIEWS

SCIENCE WRITING

The Technical Writer

An Aid to the Presentation and Production of Technical Literature By J W Godfrey and G Parr Pp 340 (London Chapman and Hall, Ltd, 1959) 45*s* net

WHAT exactly Ecclesiastes would have said about the making of books about the making of books—among Charles Lamb's *biblia abiblia*—we cannot know, but so shrewd an observer would surely have noticed that there seems nowadays to appear a steady stream of books about the writing, typing, editing, printing and publishing of scientific material But perhaps the book to end books of this kind is the one before me, which probably deals more extensively than any other in English, on either side of the Atlantic, with every stage in the production of scientific and technological printed documents, from papers and pamphlets to text-books and encyclopædias

It is implicit in the authors' undertaking that good must come of the writer's knowing something about the procedures that are the responsibilities of the compositor and the 'Reader of the Press', who are going, respectively, to set his manuscript in print and to correct its first proofs What is not so certain is whether the authors also think that it would be good for the latter two craftsmen to know something about the first one's problems For the most part, those at the publishing end of the chain have to gather piece-meal all they need to know about the scientist's literary habits—if anything so varying and variable can be described as a habit This book will certainly make the task easier, in spite of the fact that it seems primarily intended for the instruction of those engaged in the pre-printing part of producing "Technical Literature"

This, the comprehensive if somewhat vague title of the book's first chapter, is there defined more precisely, and it becomes evident, as is stated by the authors and seems inevitable from their own technical backgrounds, that there is a bias towards engineering and allied subjects, including physics, in the illustrative examples they have chosen This in no way detracts from the value of the book for those practising other disciplines, and for two reasons first, there are many problems of presentation common to all scientific disciplines and their technologies, secondly, the call for neatness and exactness in both text and illustrations is probably greater in physics and its applications than in any other scientific field, so that the methods used to achieve them may be studied with advantage by those who are not engineers

Chapters 2 and 3 deal, respectively, with "The Technique of Technical Writing" and with "Style and Presentation" In some ways they are the least satisfactory chapters in this immensely well-informed useful book, if only because they take insufficiently into account, again perhaps because of the general bias towards physics and its technological offspring, the great variety of journals spread over half a dozen or so major sciences and their numerous applications, with a bewildering mass of differences in conventions and 'house rules' Moreover, I have an uneasy feeling that the authors, who in general write lucidly and economically, are possibly not the best mentors on the writing of English My suspicions about this matter were first aroused by the fact that they recommend, and rightly so, Fowler's "Modern English Usage" as one of the books always to be consulted, and so presumably to be followed, by the scientific writer, yet seem themselves unable to adopt, or to be unaware of, Fowler's still valid distinctions between 'which' and 'that' as relative pronouns

From Chapter 4 ("Illustrating the Text") on the book becomes increasingly concerned with mechanical rather than with intellectual processes, so that Chapters 5, 6, 8 and 9 describe, in that order, "Printing Processes", "Setting Out the Text", "Typography for Technical Publications" and "Set-up of a Technical Publications Unit" Intermediate in concern with hand and brain are Chapters 7 and 10, which deal with "Editorial Procedure" and with "Technical Authorship", the latter phrase is not particularly illuminating, but the chapter covers an attractive medley of often apparently trivial matters, though they occasionally may assume frighteningly large proportions, such as the preface, the 'blurb', indexing, copyright, defamation, translation The book ends with four useful appendixes (wrongly called 'appendices' by the authors, who in this matter follow the bad example set by some official publications)

In one appendix the authors rightly insist on the duty of all writers (and they might perhaps have added of all editors too) to stick to the British Standard 1219, from which they quote substantial portions, when correcting proofs In subsequent editions they will doubtless direct attention also to the British Standard 2509 (Periodicals of Reference Value Form and Presentation), which has become available since their book was first published What

I should have liked, however, is rather more emphasis on two additional essentials

First of all, long before the proof-reading stage is reached, the correct conventions should be followed when indicating on the manuscript (which must be typewritten) how and where particular words and phrases are to be set in print Thus nothing is more infuriating to an editor (or misleading to a compositor) than use of the single underline to indicate, for example in the list of 'references', both the setting of journal names (or their abbreviations) in italics and the setting of volume numbers in 'bold' type , and this leads me to the second 'must'

The authors of scientific papers—and it applies to them much more than to pamphlets and books and other non-periodical publications—are under both a practical and a moral obligation to study meticulously, and having studied to follow just as meticulously, the exact conventions observed in the journals to which they intend submitting manuscripts In such matters as the use of italics, already referred to in a slightly different connexion, or of 'full-stops' after abbreviations and captions, the particular system of references used (as distinguished by the authors on pp 95 *et seq*) and the arranging of headings and side-headings, previously published papers in each individual journal must be examined The method and place of inserting tables and illustrations, and also of their legends, and in particular how much, if anything, is to be put on graphs besides points and lines, are almost always covered by the "Instructions to Authors" issued by or in many journals

There are two reasons why the author of a paper should take all possible trouble to reduce to a minimum the need for editorial amendment of his manuscript First, he will thereby establish some degree of confidence towards himself not only from the editor but also from any assistant editors or referees to whom his draft is submitted , a reputation for scrupulousness in the preparation of manuscripts for the press cannot harm and may enhance the author's reputation for general reliability, even in his own field of science Misdemeanours in these matters are, by that same token, seldom forgotten

The second reason is simply good manners Many editors and referees acting for scientific and technological journals, especially those that primarily cover the basic sciences and are published by learned societies, work in a purely honorary capacity, being already fully employed in research, teaching or administrative jobs undertaking their additional tasks as labours of love Anyone who, through carelessness or laziness, increases their work unnecessarily—and indeed this is also true, *mutatis mutandis*, for the paid editor—is simply guilty of gross discourtesy to a scientific colleague The matter is one neither of science nor of English, but just of professional courtesy

"The Technical Writer" will undoubtedly help to smooth the path between the taking of scientific or technological action and its description in print It must be on the library shelves in every department of every institution in which individuals prepare papers for publication in scientific, technological and technical journals Some senior members of such institutions, especially if they are involved in producing books as well as papers, might with advantage possess their own copies For editors and referees and their associates on editorial boards and publication committees, possession of this book is obligatory Above all, when the young and the not-so-young author is putting the final touches to his draft before submitting it for publication, let him think of the editor, whose editorial duties are so well made clear in this book, and remember that there, but for the grace of God, may he one day go—and act accordingly

A L BACHARACH

NEWTONIAN DOCUMENTS

Isaac Newton's Papers and Letters on Natural Philosophy and Related Documents

Edited with a General Introduction by I Bernard Cohen Assisted by Robert E Schofield Pp xiii + 501 (Cambridge At the University Press, 1958) 70*s* net

THE study of the history of science is still seriously hampered not only by the lack of enough good secondary works but also by the unavailability of major sources Fortunately as regards the study of Newton the situation is improving an English translation of the "Principia" is in print, and a *variorum* edition promised , the "Opticks", with adequate introductory material, has been reprinted recently , the Royal Society edition of Newton's correspondence is eagerly awaited , and a Leverhulme award has been made for the study of Newton's mathematical papers

The present work is a further important contribution in this field It "brings together for the first time Newton's scattered papers and letters on natural philosophy (excluding mathematics, pure theology, and biblical chronology) as they were actually available *in print* during most of the 18th century" Apart from the "Principia", the "Opticks" and the comparatively uninfluential "Optical Lectures", the papers reprinted in this volume represent "the complete corpus of Newton's writings on physical science that actually influenced the scientists and thinking men of the 'Age of Newton' "

The first group of scientific papers comprises Newton's "New Theory about Light and Colors" and the documents of the controversy to which this gave rise, together with his second paper on the subject (read to the Royal Society during 1675–76 but not published until 1757) and his papers on the improvement of the telescope In all, these account for nearly half the book It is of the greatest convenience to have the objections raised against Newton's theory and his replies collected together in a single volume , and the reader will have sympathy with Newton's later remark to Leibniz, "I was so persecuted with discussions arising from the publication of my theory of light, that I blamed my own imprudence for parting with so substantial a blessing as my quiet to run after a shadow" T S Kuhn's twenty-page introduction to this section will greatly help the reader to thread his way through the controversy, even if he feels at times that Mr Kuhn is perhaps too critical of Newton But there is no doubt that Newton brought many of the troubles on himself by leaving his original exposition seriously incomplete

The remaining papers form a miscellaneous collection on chemistry, atomism, the aether, and heat, and there is a short introduction by Marie Boas. There then follow letters from Newton to Bentley "containing some arguments in proof of a deity", with the famous passage in which Newton asks

Bentley not to ascribe to him the notion of gravity as "essential and inherent to matter"; Bentley's lectures on "a confutation of atheism from the origin and frame of the world"; Halley's review of the "Principia" and the account of Newton's work which he wrote for presentation to King James; the first biography of Newton, Fontenelle's "Éloge"; and, as an appendix, an index to the references to Newton in Birch's "History of the Royal Society".

Apart from the general introduction by I. B. Cohen, the introductions to the various sections, and the appendix, the whole of this volume is already available to scholars with access to a good library. Those who are not so fortunate will benefit most from the book; and teachers of the history of science will at last be able to give their students an opportunity to study Newton's mind at work. But one may perhaps question whether the best methods have been adopted. In every case the papers and letters are reproduced facsimile. Obviously one must have the original diagrams reproduced facsimile, if only because their shortcomings led to misunderstandings; equally obviously, if one is to study the impact of Newton on the eighteenth century, one must read him in the sources available in the eighteenth century. But does one need to work with the type then used, and to correct the misprints oneself? Some papers are printed first in Latin and then—for some reason still facsimile—in a nineteenth-century translation. On the other hand, Fontenelle's "Éloge" is given only in English, although Gillispie in his introduction says the translation "is frequently clumsy and nowhere better than adequate". It is difficult to understand why the whole was not reset in modern type, with misprints corrected and with footnotes giving at least the pages for reference back. But this is to say only that a very useful book might have been better.

M. A. Hoskin

A RELIGION OF MAN?

Concerning Human Understanding

Essays on the Common-sense Background of Philosophy. By Prof. Nikunja Vihari Banerjee. Pp. 333. (London: George Allen and Unwin, Ltd., 1958.) 30s. net.

PROF. N. V. BANERJEE, in his recently published book entitled "Concerning Human Understanding", has in fact made a collection of a number of his essays which were written over a period of twenty years.

The title is slightly misleading as the essays of Banerjee are concerned primarily not with the theory of knowledge or understanding but rather with a quest for a religion which will unite (in a sense) the conflicting values of oriental and occidental cultures.

These culminate in a final essay (Part 4. 5) which is in fact a strong recommendation to the world of "the principle of love and kindness in the will of man, and in the world of human affairs, in order that power, and law and institutions, instead of having to exercise relentless authority and despotic rule over man, may be dedicated to the cause of humanity and consequently the world that is to sustain man from the cradle to the grave may become as good as possible and really human. And this suggests the remedy for the crisis of civilization which seems to have reached its climax in our day" (p. 324).

Prof. Banerjee takes Jesus as the supreme example of a dedicated life, such as he advocates. Banerjee has the advantage of being well acquainted with both the chief "Eastern" religious cults and with Christianity in its "Western" expression.

He is severely critical of what he calls "the latest phase of human civilization", in particular of the contrast between the extending achievements of natural science, on one hand, and, on the other, the activity of "political organizations, headed by the State", which are apt to determine man's present as well as his future, and which, according to Banerjee, are approaching Nature in what he calls its irrational and inhuman quality. It is in this context that Banerjee writes with most emphasis of "the failure of civilization".

He writes that man is hostile to and divided against himself in an unprecedented way. Nature is also hostile to man, but this is inevitable, while man's hostility to himself is suicidal.

In what he claims is a historical retrospect, Prof. Banerjee contrasts "the religion of God or gods", for which religion Nature is an object of *fear* (my italics), with what he calls "the religion of man".

To overcome the fear of Nature, Banerjee contends, is not enough. Mankind needs to keep his awareness of the hostility of Nature as a kind of stimulus (p. 325).

"The remedy" is approaching. It increases peace with Nature (*loc. cit.*). Here again the Eastern and Western mind are contrasted. Western civilization tends to distract the attention of man from what is wrong in himself, while on the other hand, oriental civilization is conspicuously introspective. Hence, according to Banerjee "the developed eastern mind" is more aware of the problem of liberation.

This book is readable and challenging, but it is doubtful whether the author succeeds in providing sufficient evidence for his sweeping generalizations, for example, about theories of knowledge (Parts 1 and 2), and about philosophy generally, including the theory of value (Part 3). It is also regrettably doubtful whether or not he succeeds in making plausible the more optimistic parts of his book, that is to say, those in which he appears to recommend a confident expectation of the reconciliation of all the opposed tendencies (for example, between Eastern and Western thought) which he clearly and eloquently describes.

D. J. McCracken

HUSSERLIANA COMPLETED

Edmund Husserl

Erste Philosophie (1923/24). Zweiter Teil: Theorie der Phänomenologischen Reduktion. Herausgegeben von Rudolf Boehm. (Husserliana, Band 8.) Pp. xliii+594. (The Hague: Martinus Nijhoff, 1959.) 26.75 guilders, paper bound; 32 guilders, cloth bound.

WITH the appearance of this part, the plan to issue eight volumes of the works of the great master of phenomenology has reached fruition. The Husserl-Archiv at Louvain has erected as enduring a monument to his memory as can be imagined. Scholars in this field are thus obliged to study such a pre-suppositionless philosophy to the limit of their powers, not only for its own sake but in due recognition of its place as a basis for all knowledge. Whether the emphasis is mathematical or psychological, or anything in between, the need is for rigour and the re-establishment of an acceptable first philosophy (re-establishment because the necessity was clear enough to Aristotle; then as now, there will always be links with theology whether seen overtly or not). The passage of some twenty-three centuries has but underlined mankind's urge to re-discover metaphysics (as first knowledge), not merely as a matter of professional controversy but as an essential stance for human thought in every sphere.

Before going further, a cordial tribute is fully due to the editor of this member of the series (and of No. 7 also), Dr. Rudolf Boehm, for the immense labour which he has expended upon his task. I was privileged to catch a glimpse of the work in progress at Louvain, and to participate for an hour or two in discussion. Perhaps nowhere else in the world to-day can epistemology be better experienced than in that upper room furnished in the Cardinal Mercier Place.

The book now before us is the second part of Husserl's "Erste Philosophie" (1923–24), that is, that concerned with the theory of phenomenological reduction. It consists of four main sections with an editorial introduction, together with a number of supplementary passages, and an appendix. The core is the assemblage of lectures 28–54 inclusive which, with numbers 1–27 (Volume 7), were delivered by Husserl before the University of Freiburg-im-Breisgau. Section I deals with preliminary mediations upon the apodeictic beginning of philosophy. Section II provides a *critique* of experience, the first approach to transcendental reduction. Section III discusses the phenomenology of this process, the second approach to phenomenological reduction. Section IV brings together phenomenological psychology, transcendental philosophy and phenomenological philosophy.

Since the central theme presents with the utmost rigour the universal question of the possibility of 'knowing' the world around us in terms of a proper relationship between objective time and subjective time-consciousness, it is well to recollect the three kinds of knowledge commonly accepted by scholars. Thus, apodeictic knowledge is the knowledge of something which must occur, assertoric knowledge is the knowledge of what is actually happening, whereas problematic knowledge refers to the knowledge of what might occur, or at least, be capable of occurring. Much of Husserl's outlook is, technically, problematical: it is here that his work touches the domain of discovery as if to say 'so and so is possible'.

The value of this for natural science lies perhaps in the augmented part played by probabilities in modern physics. The whole focus of phenomenological reduction is upon not merely the possibility but the necessity of avoiding immediate judgment over a wide field of human cognition. Formally, this is likely to remain inevitable, but in the applied sciences it may look like an insidious form of escapism. Such a view—if it exists—would seem to be mistaken; the whole of technology approximates to one great exercise, or worked example (however important and ingenious), rather than to the deliberate contemplation of fundamentals. It is not the fault of this ceaseless striving for a pre-suppositionless discipline that physics tends, in matters philosophical, to look after itself. But, on the other hand, natural science has fed back quite a few basic problems for the consideration of 'first philosophers'.

A peculiarity of this noble work, which is assessed as a major contribution to the humanities, is that it implies, to a considerable extent, self-immolation, and that not once, but twice. The first instance is that the very idea of transcendental phenomenology, so highly valued by Husserl, appears to have suffered an almost complete dissolution in this attainment of the notion of a contemporary first philosophy. The second abandonment is that of the Cartesian way as we find it in the *Ideen* and the *Méditations Cartésiennes*. Maybe this is not the one and only road to "Philosophie als strenge Wissenschaft", to which ideal Husserl remained completely loyal. It is characteristic of a mind of the first order that it can face the obliteration of the lesser by the greater without flinching, while at the same time offering us a new chapter in epistemology comparable perhaps with the advent of Descartes and all that followed it.

F. I. G. RAWLINS

SUBSTANCE AND SHADOW

The Prof

A Personal Memoir of Lord Cherwell. By Sir Roy Harrod. Pp. xv+282+4 plates. (London: Macmillan and Co., Ltd., 1959.) 25s. net.

LORD CHERWELL'S complex life is a challenge to biography. Probably no Englishman since Francis Bacon has combined such a deep interest in natural science with so high a public office; and Cherwell's contemporaries may well be as divided in their approbation as were those of Bacon. A biography of Lord Cherwell, taking all aspects fairly into account, must therefore be a most interesting book. Lord Birkenhead has been asked to write it.

In the meantime, Sir Roy Harrod has produced a personal memoir based on more than thirty years close acquaintance with the 'Prof'. As the author realizes, the book is at least as informative about himself as it is about his subject; this review will deal only with the new light that is thrown on Lord Cherwell. Sir Roy recounts some painful incidents in Oxford between the two World Wars; they bear credit to nobody and to no institution, and it is perhaps a pity that they could not have been left in the senior common room atmosphere in which they originated. There are, however, some interesting glimpses of Oxford twenty to thirty years ago, as seen by a humanist with an active sympathy for science. We in the laboratories often felt that there was a prejudice against science in the University, but we could not be sure that we were not being unduly sensitive. Sir Roy, as an onlooker, makes it quite clear that the prejudice did exist, and that Lord Cherwell fought it valiantly. Whatever may be said in criticism of his personal efforts in research after the First World War, he led the advancement of the Clarendon Laboratory; he was also one of the foremost in getting the place of science recognized in Oxford, and indeed in Britain generally.

Sir Roy reflects on some of the reasons for the comparatively small amount of research in physics personally undertaken by Lord Cherwell after 1919. There is one further reason that ought to be taken into account; many of us who found ourselves in positions of high activity during the War know that it was not easy to settle again into the quieter pursuit of research, particularly if it seemed that various aspects of national defence with which we ourselves had been formerly associated were not being properly developed. It is more than possible that this same uneasiness distracted Lord Cherwell; it certainly led him to spend much effort on air defence matters after 1933.

As regards the Second World War, Sir Roy Harrod mainly confines himself to his subject's activities in the fields of economics and logistics, and these show the surprising extent to which Lord Cherwell's interests went beyond physics. The reader may, however, be led to draw an incorrect conclusion from the fact that Cherwell had eight economists on his staff in 1940, and only one scientist. The numbers do not reflect the relative depths of his interests; many of the scientific factors were so deeply in his mind that one assistant was perhaps all that he required—and in any event there were scientists throughout the Government service on whom he could always call. It is probably this field of Cherwell's activities, the use of science in war, on which least has yet been published, and which will be of the most general interest. Sir Roy hints at some of the pre-war difficulties that arose in Sir Henry Tizard's Committee for the Scientific Survey of Air Defence, in the Air Ministry, but he appears to have heard only a fragment of the story; more is to be found in Vol. 1 of Sir Winston Churchill's war memoirs. The Tizard Committee was one of the most distinguished and effective bodies ever to serve Great Britain, and it is impossible not to sympathize with the Committee which, having discussed and rejected some of Cherwell's ideas at Air Ministry level, then found them proposed afresh but unaltered in the still higher forum of the Committee of Imperial Defence. At the same time, one can appreciate Cherwell's earlier chagrin on finding that the Air Ministry, by forming the Tizard Committee, had forestalled his proposal for a committee on science in air defence at the highest political level.

Many of the details, both of this story and of others later in the War, if they are told, will not make complaisant reading. But they will be of extreme interest, and they may be expected to confirm the impression warmly given by Sir Roy Harrod that, even with the contradictions of his character, there was much to like and admire in 'the Prof'. The wisdom of some of his acts may be questioned, but science in Britain is the stronger for his efforts.

R. V. JONES

ASPECTS OF SOLID STATE PHYSICS

Solid State Physics

Advances in Research and Applications. Edited by Frederick Seitz and David Turnbull. Vol. 4. Pp. xiv+540 (1957). 12 dollars. Vol. 5. Pp. xv+455 (1957). 11 dollars. Vol. 6. Pp. xiv+429 (1958). 12 dollars. (New York: Academic Press, Inc.; London: Academic Books, Ltd.)

THESE three volumes of a series initiated in 1955 contain seventeen articles, of length ranging from 9 to nearly 200 pages, on various aspects of solid state physics. It is scarcely possible, even if it were desirable, to attempt to give, in a single review, a critical assessment of all these articles. As the series expands, something like a balanced survey of a very wide field may be approached asymptotically by the aggregate of articles. Each particular volume, however, contains a rather mixed bag, and the only way of giving an objective indication of the contents is by listing the articles with brief annotations.

The longest article in Volume 4 is that on ferroelectrics and anti-ferroelectrics by W. Känzig, who surveys the field comprehensively, brings out the similarities and differences between ferromagnetics and ferroelectrics, and usefully prefaces the detailed accounts of particular materials by general summaries. The theory of mobility of electrons in solids is reviewed by F. J. Blatt. It is notable that, although the general principles underlying the interpretation of transport effects are well established, it is only rarely that good quantitative agreement between theoretical and experimental results has been obtained, and that, in this respect, the treatment of metals still lags well behind that of semi-conductors. The value of investigations of single crystal specimens of high purity and perfection is reflected in the account, by W. G. Pfann, of the techniques of zone melting and crystal growing. Another kind of technique is described by T. O. Woodruff in his article on the orthogonalized plane-wave method, exemplified by its application to silicon, for which the results obtained seem disappointingly inconclusive. A "Bibliography of Atomic Wave-functions" by R. S. Knox is essentially an extension to 1957 of a list of references compiled by Hartree some ten years earlier.

Volume 5 includes a full discussion, by M. H. Cohen and F. Reif, of quadrupole effects in nuclear magnetic resonance, with particular emphasis on the way in which the splitting and broadening of lines provides information about the internal electric fields in solids. Galvanomagnetic and thermomagnetic effects in metals are surveyed by J.-P. Jan, and discussed in terms of a two-band model. A unified treatment of the irreducible representations of the space groups, relevant to solutions of the Hamiltonian for perfect solids, is given by G. F. Koster, assuming a knowledge in the reader of the general theory of groups and their irreducible representations. C. C. Klick and J. H. Schulman deal with luminescence in solids, emphasizing the basic physical principles involved and discussing primarily inorganic phosphors. Shallow impurity states in silicon and germanium are treated by W. Kohn, who describes the empirical facts, and discusses the extent to which, in particular by advances in the theory of donor states, it has been possible to correlate a wide range of electrical, optical and magnetic properties.

There are seven articles in Vol. 6, as compared with five in the other two volumes, the subject-matter ranging from the primarily experimental to the purely theoretical. There is an extensive review by W. W. Piper and F. E. Williams on recent work on the complex phenomenon of electro-luminescence, with special reference to the basic mechanisms, and to the behaviour of zinc sulphide. The compression of solids by strong shock-waves is treated by M. H. Rice, R. G. McQueen and J. M. Walsh, who describe how modern high-explosives experimentation has extended empirical knowledge of pressure-volume relations far beyond the range over which precise static compressibility studies have been made. Experimental work during the past decade on secondary electron emission induced by electron bombardment is reviewed by A. J. Dekker. A much wider time range is covered by the article by M. P. Givens on experimental and theoretical work on the optical properties of metals, a subject which has fallen outside the main fields of recent research. D. L. Dexter presents a general account of the basic theory of the optical properties of imperfections in non-metals. An article by G. Borelius on changes of state of simple solid and liquid metals is essentially a summarizing survey of a recent series of papers by him dealing with a semi-macroscopic analysis of energy, entropy and volume into vibrational and structural parts. Finally, there is an account of macroscopic symmetry and properties of crystals by C. S. Smith in which a systematic development of the formal theory is supplemented by physical arguments, and applied in the discussion of a wide range of physical properties.

There is no doubt that most of the articles in these volumes will be of value to those engaged in, or preparing to undertake research on, the topics with which they are concerned. This would hold even of articles which are essentially compilations of condensed information about work presented in many different journals, or which are advanced expositions of some particular theoretical topic. A reader with a good general background knowledge of solid state physics, for whom this series is intended, may, however, properly wish to be conducted into some more particularized field, rather than pushed into it. Such a reader will emerge from some of these articles with no clear impression at all. The writers, as guides, are often too conscientious, too modest, or just plain indifferent: too conscientious in trying to make reference to every piece of work they have been able to find; too modest in not allowing any trace of personal judgment, even by selection, to become apparent; or plain indifferent in not caring whether a condensed piece of theoretical exposition is likely to be intelligible to an average reader or even, sometimes, whether it is intelligible to themselves.

In these volumes there is a theoretical article which begins at a level so far beyond that of most physicists as to be virtually useless by itself in this form. Another theoretical article is a first-rate piece of exposition, at an appropriate level, though even this jumps the traces occasionally, and would be improved by the addition of a few explanatory sentences or paragraphs. On the more experimental side there is an article which contains more than seventeen pages of tables, mostly of experimental data of very specialized interest, which are completely out of place in a series of this kind. Other primarily experimental articles suffer from a congestion of factual material. In some, however, much thought has clearly been given to presenting a clear and balanced picture of a particular field, at the expense of omissions which are likely to be deplored only by a few of the less able writers of Ph.D. theses.

The adverse comments which have been made must not be taken to imply that the average standard of the articles in these volumes is unusually low; indeed, compared with the general run of review articles, it is unusually high, in keeping with the already established reputation of the series. Even here, however, the prevalent diseases of review articles and their writers are becoming apparent: the spotted reference fever of the one, and the introversion of the other. These can be controlled, and when they are, and other more positive conditions are satisfied, review articles may result which, like a few of those here, are in their own right substantial contributions to science.

I am indebted to my colleagues Dr. P. Rhodes and Dr. E. F. W. Seymour for also reading a number of the articles in these three volumes, and giving me the benefit of their comments. E. C. STONER

MUSIC AND ELECTRONIC COMPUTORS

Experimental Music

Composition with an Electronic Computer. By Prof. L. A. Hiller, Jr., and Leonard M. Isaacson. Pp. vii+197. (London: McGraw-Hill Publishing Company, 1959.) 46s. 6d.

So much is heard nowadays of the capabilities of the computer robot in imitating every human activity that it is not surprising to read of experiments in which the computer is made to compose music. Perhaps to say that the machine 'composes' is putting the experiments described in this book at too high a level, as probably the authors would be the first to admit. What the computer has been asked to do is, in fact, to produce a *canto fermo*, a series of notes following certain rules which every student of harmony has to practise at an early stage of the music course. Since these rules are largely negative, it is, of course, quite easy to feed into it a programme in which it may choose the next note at random, provided it does not, for example, form a tritone, jump more than an octave, and so on. The result is something which will pass a music examiner, or would have done in the past century, but is scarcely a composition. It is rather like asking a laboratory technician who can blow glass, solder, join wood and nothing more to carry out an original piece of research.

This writing of a *canto fermo* is not the sole musical experience of this particular electronic computer. There are others, and the authors have gone so far as to orchestrate them for string quartet. Read as scores (given in the text) they are not very impressive. One cannot expect to create a mechanical Bach or Mozart, but it evidently takes more than a few programmes to endow our robot with the divine afflatus which could produce even a simple folk tune. Nevertheless, these experiments are amusing and the account of them is well written, so that one does not need to be a *habitué* of the computer room to understand what the authors were planning.

E. G. RICHARDSON

SEMICONDUCTORS

Optical Properties of Semi-Conductors

By Dr. T. S. Moss. (Semi-Conductor Monographs.) Pp. x+279. (London: Butterworths Scientific Publications; New York: Academic Press, Inc., 1959.) 50s.

Fluctuation Phenomena in Semi-Conductors

By Prof. A. Van der Ziel. (Semi-Conductor Monographs.) Pp. viii+168. (London: Butterworths Scientific Publications, 1959.) 35s.

Progress in Semiconductors

Vol. 3. Edited by Dr. Alan F. Gibson, Prof. R. E. Burgess and Prof. P. Aigrain. Pp. viii+210. (London: Heywood and Co., Ltd., 1958.) 55s. net.

An Introduction to the Theory and Practice of Semiconductors

By Dr. A. A. Shepherd. Pp. 206. (London: Constable and Co., Ltd., 1958.) 18s. 6d. net.

Half of Dr. Moss's book gives a general discussion of the theory of optical effects in solids. The other half presents summaries of the optical properties of a range of semiconducting elements and compounds. Although these summaries are brief they are meaty and well supplied with references and would seem a useful supplement to a general text-book on solid state physics: a reminder of the complexity of the subject and of the tenuous physical basis of some of the more elaborate mathematics.

Prof A Van der Ziel has written a clear and thorough book on the present status of the theoretical and experimental work on fluctuation phenomena, or electrical 'noise' in semiconductors. Both the above books are in the series of "Semiconductor Monographs".

Volume 3 of "Progress in Semi-Conductors" includes articles entitled: the magnetoresistivity of germanium and silicon, the chemical purification of germanium and silicon, electronic conductivity of silver halide crystals, silicon junction diodes, lifetime of excess carriers in semiconductors, scattering and drift mobility of carriers in germanium, and electronic processes in cadmium sulphide. An index is provided.

Some years ago the study of silicon and germanium became a popular *folie* and vast sums have been devoted to it. But even if these elements seem predominant when looking out from the centre of a vast industrial structure built upon their semiconducting properties, the student of semiconductors should surely have the subject presented with more judiciously chosen proportions. Despite its title, "An Introduction to the Theory and Practice of Semiconductors", Dr A A Shepherd's book is mainly restricted to some technological aspects of the adamantine structures.

R A Hyman

INTERNATIONAL CONFERENCE OF RADIO ASTRONOMERS

Paris Symposium on Radio Astronomy

Held from 30 July to 6 August, 1958. Edited by Ronald N Bracewell. (International Astronomical Union. International Scientific Radio Union.) Pp xii+612. (Stanford, Calif: Stanford University Press, 1959.) 15 dollars.

MORE than 160 of the scientists who work in the rapidly growing branches of radio astronomy, or in related subjects, attended a symposium in Paris in July 1958. This was a useful preliminary meeting to the tenth Assembly of the International Astronomical Union in Moscow a month later. The volume under review contains the proceedings of the Paris symposium, and the editor and publishers are to be congratulated that they have fulfilled the time-table outlined for the symposium, and have produced this large volume of proceedings within twelve months of the meetings. The volume is divided into six parts, each of which opens with an introductory lecture given by one of the leading scientists in the field. There follow 10–30 papers, and significant contributions to the discussion which followed each paper, or group of papers. Particularly valuable are the concluding lectures at the end of each part of the book. In these lectures distinguished astronomers attempted to relate the often diverse individual papers, and to emphasize those parts of the subject where theoretical discussion or further observations seemed to be most needed.

The first half of the book deals with radio studies of the solar system. There is a short section on radio-echo observations of the Moon, and on the thermal radiation at millimetre wave-lengths from the Moon, Venus, Jupiter and Saturn. This is followed by a much longer section on radio observations of the Sun, and the classification and interrelation of the variable solar emissions.

The second half of the book contains two sections dealing with the emissions from galactic and extra-galactic sources, and the study of galactic structure by means of the 21-cm line of neutral hydrogen. Some may regret that the papers on hydrogen line work are divided rather artificially between these parts 3 and 4 of the book, but all must welcome the successful 'marriage' of observations from Leyden and Sydney, to give a map of our galaxy which is almost complete, and very detailed. The accuracy of this work has led to a re-definition of the galactic pole which is more accurate by an order of magnitude than the earlier definition based on optical observations. The detection of radial motions of the gas in the central parts of our galaxy will act as a further stimulus to the theoretical work on the stability of spiral structures.

Section 5, on discrete sources and the universe, contains probably the most vigorous of the discussions at the symposium. This centred about the problems, first, of the great preponderance of the radio sources with which optical objects have not yet been identified, and, secondly, the attempts to extract cosmological information about the origin and evolution of the universe from the statistics of the unidentified sources. More measurements of angular size and source intensity are urgently needed, so that the sources may be classified by their surface brightness, and the statistics of a reasonably homogeneous group of sources can be studied. There are grounds for hope that radio astronomers can provide observations of cosmological significance, but these results have probably still to appear.

The last part of the book is on the theory of solar and cosmic emission mechanisms. There is now wide agreement that most non-thermal cosmic radiation is generated by a synchotron process, in which electrons moving with relativistic speeds suffer accelerations and spiral motion in magnetic fields. One outstanding problem is the connexion between the relativistic electrons and the cosmic-ray flux and its energy distribution. Some workers argue that cosmic rays originate in supernova explosions. Others suggest that the cosmic-ray flux is a manifestation of a universal hot gas from which the galaxies condensed. On this latter theory, radio emission occurs whenever the magnetic field is increased by compression of the gas, which may be due to local cooling, to stellar explosions, or to galactic interactions.

The radio studies of the solar system and of the galactic and extra-galactic radio sources had seemed rather distinct, though one speaker emphasized that they were linked by an incomplete understanding of the mechanisms of emission. Simple extrapolation suggests that the proceedings of a further conference would fill a volume of unmanageable size. Perhaps any future symposium could be divided even more clearly, so that the proceedings could appear in separate, smaller, and less expensive volumes.

This volume is liberally supplied with diagrams, tables and half-tone photographs, and there are very few printers' errors. It will be an extremely useful and up-to-date reference book and bibliography for all working in radio astronomy, though few will read every paper It is surely indispensable to all libraries with an astronomical section, and those who can afford private copies will find it very easy to lend to their astronomical friends H P PALMER

MODERN INORGANIC CHEMISTRY

Advances in Inorganic Chemistry and Radiochemistry

Vol 1 Edited by H J Emeléus and A G Sharpe Pp xi+450 (New York: Academic Press, Inc , London Academic Press, Inc (London), Ltd , 1959) 12 dollars

WITHIN the past twenty years inorganic chemistry has recovered from a moribund state to be, with radiochemistry, a fast-growing and extremely active branch of chemical science Modern inorganic chemistry ranges from physical chemistry and pure radiation chemistry through analytical chemistry to the study of organo-metallic compounds It is satisfying that this present volume reflects this wide range of interest

In the first chapter, H Taube writes on "Mechanisms of Redox Reactions of Simple Chemistry" This chapter is difficult reading for the non-specialist, who is not helped by a lack of clearness of the definitions of the various terms used However, the actual discussion is extremely clear and contains many details of reactions which the inorganic and analytical chemist tend to think of as simple but which are, as yet, very imperfectly understood The other chapter of interest to the analytical chemist is on "Activation Analysis", by D H F Atkins and A A Smales This review should be of use to all interested in the determination of microgram and sub-microgram quantities of the elements, but would have been improved by a comprehensive table of the various isotopes and methods used in analysis Again, on the physical side T C Waddington has given an important review of "Lattice Energies and Their Significance in Inorganic Chemistry" The author includes a brief survey of methods of calculation followed by tables of values, many of them newly calculated G Harbottle and N Sutin have written on "The Szilard–Chalmers Reaction in Solids" As an inorganic chemist, I found this chapter disappointing, as the treatment is mainly from a physical point of view and the chemical effects of the Szilard–Chalmers reaction are not dealt with in great detail

On the structural side, W N Lipscomb writes on "Recent Studies of the Boron Hydrides" The order that X-ray crystallography and topological treatment of these and related compounds has brought to this previously intractable subject is one of the most æsthetically satisfying developments in modern inorganic chemistry W Rudorff discusses "Graphite Intercalation Compounds" In view of the extensive use of graphite, often under the most rigorous conditions, in industry the importance of the study of these compounds is clear

Finally, there are three articles on purely inorganic subjects "Compounds of Aromatic Ring Systems and Metals" by E O Fischer and H P Fritz is potentially a most interesting chapter on a field which has only existed for the past eight years Although factually almost complete, the chapter is disappointing because lack of tabular presentation of the material makes comparison and cross-reference difficult N L Paddock and H T Searle write on "The Phosphonitrilic Halides and Their Derivatives" There is currently a very rapid development in the field of inorganic polymer chemistry, and this chapter does full justice to one homologous series Finally, R J Gillespie and E A Robinson deal with "The Sulphuric Acid Solvent System" The use and study of non-aqueous solvents is now widespread in inorganic chemistry and this chapter discusses the inorganic applications of what is probably the best understood system

The volume is extremely well produced and almost free from typographical errors, the omission of all the arrows from one Born–Haber cycle being the most noticeable mistake My major regret is that the high price will probably mean that it will be purchased only by libraries, and for the complete success of reviews they should be owned by the individual There is certainly a need for a volume of reviews on inorganic chemistry, and if the editors can obtain articles of the present standard and interest for succeeding volumes the success of the series is assured D W A SHARP

CLASSICAL CHEMICAL ANALYSIS

Comprehensive Analytical Chemistry

Edited by Prof Cecil L Wilson and David W Wilson Vol 1*a* Classical Analysis. Pp xi+577 (Amsterdam Elsevier Publishing Company , London D Van Nostrand Company, Ltd , 1959) 105*s*

THIS book forms the first part (*a*) of Vol 1 of Elsevier's "Comprehensive Analytical Chemistry" which is to consist of five distinct volumes, some containing several parts Vol 1*a* (to be followed by 1*b* and 1*c*) deals with classical methods of analysis and contains six distinct chapters Each chapter contains contributions from authorities in particular fields of analytical chemistry and there are, including editorial contributions, a total of nineteen individual authors in the present book

The subject-matter is essentially of an introductory and general nature which is of importance in all branches of analytical chemistry , but included also are processes of sufficiently long standing that they can come under the general heading of "Classical Analysis Chapter 1 is the editorial introduction to the entire work This is followed by a chapter headed "Analytical Processes", which contains sections on materials, sampling, statistics, weighing, measurement of volume, solvent extraction, organic reagents in inorganic analysis, and occupies some 220 pages Chapter 3 (87 pages) deals exclusively with gas analysis, Chapter 4 (68 pages) with inorganic qualitative analysis, and Chapter 5 (32 pages) with organic qualitative analysis Chapter 6 (115 pages) treats the subject of inorganic gravimetric analysis

In the main, this first part lives up to the standard expected from the general title , but in certain sections individual bias has prevented a truly comprehensive presentation of material and this is most marked in the chapters on inorganic and organic qualitative analysis Here one might reasonably have expected to find a critical account of the various systems and schemes of analysis rather than a detailed discussion of one preferred system Fortunately, this does not happen to any such extent in other chapters , in fact, the chapter on gas analysis goes almost to the other extreme and presents the important aspects of the subject in a methodical and critical way

Altogether, ' Comprehensive Analytical Chemistry" has got away to a good start There are bound to be a number of blemishes in such an ambitious work, but whether these will detract seriously from the value of the completed volumes is scarcely answerable at present Undoubtedly this will become a standard reference work in analytical chemistry, but like all such extensive publishing projects, there is a considerable danger that, by the time the final volume comes from the press, the earlier volumes will be outdated The rapid development of new methods and techniques in many branches of analytical chemistry tends to lessen the value of this encyclopædic type of text, except as a means of collecting together the available information at the time of writing Too often publishing delays result in the presentation of much out-dated material, which the authors and editors are powerless to prevent

This book has the dubious advantage over four other (to the reviewer's knowledge) similar projects in being first in the field As such it is bound to come in for a good deal of comment not all of which will be friendly Nevertheless, on the basis of this first volume, an appreciably high standard has been set for the complete work, and the appearance of the subsequent parts and volumes is awaited with considerable interest Elsevier are to be congratulated on the fine printing and particularly the binding of this book which, as the series is completed, will add grace to the shelves of many libraries

WILLIAM I STEPHEN

ION EXCHANGE

Ion Exchange Resins

By Robert Kunin. Second edition Pp. xiii+466 (New York · John Wiley and Sons, Inc , London Chapman and Hall, Ltd , 1958) 88s. net

Ion Exchange

A Laboratory Manual By Dr J E. Salmon and D K Hale Pp vii+136. (London Butterworths Scientific Publications , New York Academic Press, Inc , 1959) 25s , 5 dollars.

WHEN the first edition of "Ion Exchange Resins" by Kunin and Myers appeared in 1950 it was only the second book on the subject in the English language Since then, five more such books have appeared However, only two of these have attempted general treatments of the subject and these two are brief monographs There is still, therefore, plenty of scope within the covers of a single volume for a full length up-to-date account in English of ion exchange in all its aspects, fundamental and applied This is what Dr Kunin has attempted He has certainly succeeded in considerable measure The present work is both bigger and better than the first edition Dr Kunin's greatest successes are in the chapters on ion exchange application, He has done less well on the fundamental side

Some of the faults of the first edition are still to be found here a large number of diagrams, not always very clearly labelled or explained in the text , the occasional full account of older (sometimes obsolete) theories (particularly of ion exchange equilibria) with an inadequate amount of some of the recent work In dealing with cation exchange kinetics on carboxylic exchangers Dr Kunin repeats almost verbatim the account given in the first edition The only reference he quotes in connexion with this topic is some work of Kunin and Barry in 1949 A few papers on this topic have been published since then but no mention is made of them In particular, he ignores the important theory of Bauman, which many would consider to be at least as plausible as the theory of Kunin and Barry However, the chapter on the synthesis of ion-exchange resins is a very great improvement on that in the earlier edition and there are excellent chapters on permselective membranes and catalysis with ion-exchange resins In general, anyone reading the more fundamental parts of this book would be advised to refer also to other books (Kitchener or Griessbach) to check, supplement or correct the impressions gained However, this book may be recommended as a useful reference work, particularly with regard to ion-exchange applications

Dr Salmon and Mr Hale have broken completely new ground in their book This splendid little book is an attempt (the first, so far as I know) to teach ion exchange to students by means of a carefully planned series of experiments The first five chapters form a theoretical introduction to the remainder of the book, which contains the experiments The discussions of the experiments form a particular feature of the book and they are both clear and stimulating The authors' statement (p 116) that "The regeneration of a mixed-bed column is not readily achieved with small laboratory columns" may not command universal assent, and the consequent omission of any account of such regeneration procedures is open to criticism Indeed, many workers would probably prefer a straightforward mixed-bed column for de-ionization to the three-stage procedure described by the authors However, these are comparatively minor points which later editions may remedy This book deserves every success, as it should be useful not only to students but also to all laboratory workers who have anything to do with the practical side of ion exchange

D REICHENBERG

GEOCHEMICAL RESEARCH IN THE UNITED STATES

Researches in Geochemistry

Edited by Philip H Abelson Pp x+511 (New York John Wiley and Sons, Inc , London Chapman and Hall, Ltd , 1959) 88s net

THIS book, edited by the Director of the Geophysical Laboratory, Washington, is the outcome of a seminar series in geochemistry organized by the Geophysical Laboratory and held there, and at the Johns Hopkins University, during the academic year 1957–58

It gives a valuable conspectus of current geochemical research in the United States, and the wide range of topics covered is best indicated by listing the titles of the contributions (authors' names in brackets) sedimentation on the ocean floor (G O S Arrhenius), pp 1–24 , rates of geochemical reactions at low temperatures and pressures (R M Garrels), pp 25–37 , geochemical indicators of marine and fresh-water sediments (M L Keith and E T Degens), pp 38–61 , geochemical prospecting (H E Hawkes), pp 62–78 , geochemistry of organic substances (P H Abelson), pp 79–103 , some chemical aspects of petroleum genesis (W E Hanson), pp 104–117 , mineral assemblages of the Green River Formation (C Milton and H P Eugster), pp 118–150 , tritium in hydrology and meteorology (W F Libby), pp 151–168 , measurement and use of natural radiocarbon (H de Vries), pp 169–189 , geochronology (G R Tilton and G L Davies), pp 190–216 , the variation of the ^{18}O/^{16}O ratio in Nature and some geological implications (S Epstein), pp 217–240 , isotopic fractionation of sulphur in geochemical processes (W U Ault), pp 241–259 , the use of equilibrium calculations in finding the composition of a magmatic gas phase (K B Krauskopf), pp 260–278 , the chemical environment of ore deposition and the problem of low-temperature ore transport (P B Barton, Jr), pp 279–300 . sulphide systems as geological thermometers (G Kullerud), pp 301–335 , some aspects of the geochemistry of carbonates (J R Goldsmith), pp 336–358 , diffraction effects of short-range ordering in layered sequences (F Chayes), pp 359–376 , hydrothermal investigations of amphiboles (F R Boyd), pp 377–396 , reduction and oxidation in metamorphism (H P Eugster), pp 397–426 , local equilibrium in metasomatic processes (J B Thompson, Jr), pp 427–457 ; activation analysis applied to geochemical problems (G W Reed), pp 458–475 , chondrites and the chemical composition of the Earth (G J F MacDonald), pp 476–494 , equations of state and polymorphism at high pressures (S P Clark, Jr), pp 495–511 Each article has a good selected bibliography, and the book is well produced and printed It is to be regretted that there is no index

It would be invidious to single out particular articles where all are of high standard, and it is sufficient to say that this book should be of great interest not only to geochemists wishing to have authoritative accounts of work in fields other than their own but also to geologists in general

S R Nockolds

HETEROCYCLIC CHEMISTRY

Chemistry of Carbon Compounds

A Modern Comprehensive Treatise Edited by Dr E H Rodd Vol 4, Part B · Heterocyclic Compounds Pp xviii+809–1464 (Amsterdam Elsevier Publishing Company , London D Van Nostrand Company, Ltd , 1959) 100*s*

s-Triazines and Derivatives

By Edwin M Smolin and Lorence Rapoport (The Chemistry of Heterocyclic Compounds a Series of Monographs, Vol 13) Pp xxiv+644 (New York Interscience Publishers, Inc , London Interscience Publishers, Ltd., 1959) 226*s* net

BOTH the above works are massive volumes of well over six hundred pages which are packed with detailed information to give a true review, that is, one which critically assesses the contents and their presentation, of either volume in a short space is therefore almost impossible

Vol 4*B* of Rodd's "Chemistry of Carbon Compounds" is an impressive work, in which a uniformly high standard is maintained by the seven contributors Dr Neil Campbell has written a considerable chapter on six-membered ring compounds having oxygen and/or sulphur in the ring, thus including in particular pyran, chromen, benzochromens, the corresponding thia-analogues and the many derivatives of each class He has also contributed a shorter chapter on compounds having two fused five- or six-membered rings with a nitrogen or oxygen atom in each ring These chapters are divided by an account by Sir Robert Robinson of brazilin and hæmatoxylin this article by so great an authority makes one deeply regret that Sir Robert has been too busy to make further and fuller contributions to the volume An excellent chapter on the cyanine and related dyes, giving a necessarily condensed but very clear account of this vast range of fascinating compounds, has been written by Dr G de W Anderson Dr T S Stevens has contributed a chapter on the indigo group, and another very considerable chapter on the pyrrole pigments, which contains among many other interesting subjects an excellent account of the chemistry of chlorophyll and of vitamin B_{12} Dr Stevens has also collaborated with Dr Ishbel G M Campbell in a final chapter on "Compounds containing Unusual Hetero Atoms", that is, silicon, phosphorus, arsenic, antimony, bismuth, halogen and certain metallic atoms This deals with a section of heterocyclic chemistry which is usually omitted in textbooks, but which is of absorbing interest in its own right, apart from being a refreshing change from nitrogen compounds It can be strongly recommended as a really modern review of this field Incidentally, the chemistry of silicon and phosphorus is expanding so rapidly that these elements will soon cease to be 'unusual hetero atoms'

The editor and the contributors are to be warmly congratulated on this excellent volume, which will so greatly enhance the value of the complete work

"*s*-Triazines and Derivatives" is the thirteenth volume to appear in the Interscience "Chemistry of Heterocyclic Compounds" Series, which has now become by far the major series to give a modern account of this vast division of organic chemistry The authors state that the subject-matter of this book was originally intended to be part of a single volume dealing with triazines and tetrazines, but that the immense amount of material necessitated two volumes, the first, on 1,2,3- and 1,2,4-triazines and tetrazines by Drs Erickson, Wiley and Wystrach, having been recently published as the tenth volume in the series, and this second volume is now devoted to *s*-triazines, including the purely inorganic system *s*-triazaboranes

This volume deserves to receive a wide welcome, from both academic and technical chemists Many academic chemists have only a general knowledge of many of the classes of compounds discussed. and should warmly welcome the clear and detailed account here presented many of these compounds, moreover, are of considerable and steadily increasing technical application, and the volume should therefore also be of great interest to technical chemists As an example, the chemistry of cyanuric acid, its halides, esters and other derivatives is discussed in a chapter of 120 pages the treatment ranges from a very full discussion of the physical properties of cyanuric acid to the application of its derivatives in many branches of chemistry such as dyestuffs, pesticides, resins, explosives and also in medicine Melamine and *iso*cyanuric acid are two other compounds of considerable theoretical and technical interest, and a chapter is devoted to each compound and its derivatives Condensed ring *s*-triazine systems, and hexahydro-*s*-triazines also receive a detailed and logical discussion in separate chapters All the above compounds contain the same six-membered ring system of alternating carbon and nitrogen atoms, usually of considerable stability The reader therefore may come with some surprise to hexamethylenetetramine, the whole chemistry of which is so different from that of the preceding compounds this compound does, of course, contain three such rings fused uniquely together, and the full account of its reactions is to be greatly welcomed Both inorganic and organic chemists will also welcome the final chapter on *s*-triazaboranes

The author and the publishers may be justly proud of this volume, which will give added strength to the whole Interscience series The reviewer feels that the chemical public are also indebted to the American Cyanamid Co , which has ensured facilities for the writing of this considerable volume by two members of its staff, and also for the contribution to Vol 10 by another member, Dr Wystrach

F G Mann

ENZYMES

Outlines of Enzyme Chemistry

By J B Neilands and Paul K Stumpf With a Chapter on the Synthesis of Enzymes by Roger Y Stanier Second edition, revised and enlarged Pp xii+411 (New York John Wiley and Sons, Inc , London Chapman and Hall, Ltd , 1958) 68*s* net

The Enzymes

Edited by Paul D Boyer, Henry Lardy and Karl Myrback Vol 1 Kinetics, Thermodynamics, Mechanism, Basic Properties Second edition, completely revised Pp xiii+785 (New York Academic Press, Inc , London Academic Books, Ltd , 1959) 24 dollars

THE two books reviewed here deal with the same subject but at a very different level They are aimed at different readers, but each in its class should prove extremely valuable

This second edition of "Outlines of Enzyme Chemistry", by Drs Neilands and Stumpf, has undergone considerable changes and has expanded by about one-third compared with the first edition It is intended for the beginner and gives a concise and fairly elementary coverage of the whole field of enzymology Also included is a certain amount of background material which will be very helpful to the student , for example, there is an excellent section on physical chemistry which leads smoothly into the discussion of enzyme kinetics Some chapters carry the material to a very advanced level, and the book will undoubtedly be useful to many research biochemists as a reference book A new feature is an alphabetical list of more than five hundred enzymes, with some properties and key references

A large number of references is given throughout the book, but their selection appears in places to have been rather random The density of documentation is rather uneven , for example, there are only sixteen references after a chapter on oxidation-reduction, but 136 to a chapter on the classification of coenzymes

Vol 1 of "The Enzymes", under the editorship of Boyer, Lardy and Myrback, is the first of a series of four volumes to replace Sumner and Myrback's "The Enzymes Chemistry and Mechanism of Action", which since its publication in 1950 has become a classic work of reference It is not in any real sense a second edition, but a completely new work by new authors, arranged in a different way As the editors state in the preface, much of the material will be "supplemental to that of the previous edition and thus the previous edition will continue to serve as a useful reference work in certain areas" The new series will not deal with metabolic relationships, nor will it contain details of methods of preparation, etc , which can be found in the companion treatise, "Methods in Enzymology" The aim is to give a full account of enzymes and enzyme action "on a molecular level"

Vol 1 is devoted to kinetics, thermodynamics, mechanism and basic properties It stands on its own, in fact, as a text-book on the fundamental principles of enzymology There are four excellent chapters on enzyme kinetics, including a historical survey by H L Segal and the development of the complete steady-state rate equation by R A Alberty. The mechanism of enzyme action is discussed *inter alia* by R Lumry, D E Koshland, P D Boyer and H Fraenkel-Conrat There is a useful review of structural and stereospecificity by H Gutfreund Probably the most difficult chapters are by P George and J S Griffith on "Electron Transfer and Enzyme Catalysis", and by R J P Williams on "Co-ordination, Chelation and Catalysis" , but many enzymologists concerned with oxidation systems will be extremely grateful for these carefully written accounts of relevant fundamental chemistry Although much of the book is concerned with the fundamental chemistry of enzymes and enzyme action, the final two chapters, on enzyme induction by M R Pollock, and on the control of enzyme activity by A B Pardee, introduce a more biological note

There is no doubt in the reviewer's mind that, if the standard of this first volume is maintained, "Boyer, Lardy and Myrback" will be a worthy successor to the ubiquitous "Sumner and Myrback"

Edwin C Webb

HUTCHINSON'S 'FAMILIES'

The Families of Flowering Plants

By Dr J Hutchinson Second edition Vol 1 Dicotyledons Pp xi+510 Vol 2 Monocotyledons Pp viii+511–792 (Oxford Clarendon Press , London Oxford University Press, 1959) 147*s* net the two volumes

THIS well-known work by Dr J Hutchinson was first published in 1926 (Vol 1) and 1934 (Vol 2), and has long been out of print ; a second edition, in which the treatment of the dicotyledons has been expanded and greatly altered, has now been produced by the Oxford University Press This new edition will be welcomed by those interested in changing views about the evolutionary relationships of flowering plants and will be useful to students of taxonomy (if they can afford to buy it)

To begin with, it may be said that Vol 2 is unaltered except for the addition of one family and of genera which have been described since 1934, so that this review will be concerned mainly with the first volume

The two most striking innovations in this are the extensive changes in the order of the families and the addition of no fewer than 76 families, not recognized in the first edition. It seems unfortunate, in view of this and of its special interest, that Degeneria even if not accorded family rank should not be given fuller treatment.

Dr Hutchinson indicated in 1926, and has since emphasized, his belief in the fundamental importance of the difference between the woody and the herbaceous habit in dicotyledons. This view reaches its full expression here, and when combined, as it is, with the rejection of the customary criteria of polypetally and sympetally, leads to a complete rearrangement of families. Opinions will differ about the validity of this basis, but two things are certain: there is at present no means of proving or disproving the truth of Dr Hutchinson's views, and there is equally no denying that for the general practitioner of angiosperm taxonomy the adoption of the new system would be highly inconvenient.

This, of course, raises once again the question of the purpose of classification, and it appears that here there has been an attempt to achieve two rather incompatible ends.

The first and most important is the exposition of a new and revolutionary system of classification which, Dr Hutchinson believes, represents phylogenetic relationships and distinguishes them clearly from similarities due to parallel development from different stocks. Here there is, of course, endless room for discussion and for disagreement as well as agreement, but certain difficulties, one might almost say inconsistencies, soon come to light. Why, for example, are the Malvaceae regarded as belonging to Lignosae, except to keep them near the Tiliales? More than half the genera are wholly or partly herbaceous and the wood of many of the others is not particularly hard. The Globulariaceae, placed in Herbaceae, seem much woodier.

The statement of general principles adopted for classification is the same as in the first edition, though some minor revisions might have been expected, notably in the assertion that compound leaves are derived from simple ones. The principles are not always rigorously applied or surely the Compositae would have displaced Labiatae as "the climax development of the fundamentally herbaceous line of evolution".

The second purpose of this work, and one which will be found generally useful, is the concise description of the families recognized and the provision of keys by which an unknown plant can be referred to its family. From the purely practical point of view it seems to me that it would have been more useful to have had this part of the book issued separately and arranged according to one of the better known, though phylogenetically unsatisfying, systems. These systems are fossilized in herbaria, and will remain so, since it is impracticable to rearrange even a moderate-sized herbarium every time views on classification of families change. Every working taxonomist will therefore continue to need an acquaintance with the systems of Bentham and Hooker and of Engler, so time would be saved and convenience increased if Floras and other reference books followed one of them.

If a separation of this kind had been made it might have been possible to devote more space under each family to a discussion of the reasons for the classification.

The book is well produced, as is to be expected from the Oxford University Press, though a few misprints, such as "Buddeeiaceae" on p. 101, have got by, and the drawing of what appears to be *Chenopodium capitatum* in Fig. 283 is still unlabelled. More serious is the absence of a number on p. 19, though this page is referred to by number in the text; the omission is doubtless in accordance with the best typographical practice but is annoying when one is trying to look it up. Even worse is the placing of the index to Vol. 1 on pp. 101–103 'for ready reference'. Reference would have been much easier if it had been put at the end of the volume in the usual way, though there is a suggestion on p. 101 that this was intended; if so it was overlooked.

In spite of these drawbacks the book is well worth a place in any botanical library for its iconoclastic treatment of conventional ideas, which should provoke thought and argument, and for the practical value of its keys and descriptions. T. G. Tutin

COCONUTS

The Coconut Palm

A Monograph. By Dr K. P. V. Menon and Dr K. M. Pandalai. Pp. xvi+384. (Ernakulam: Indian Central Coconut Committee, 1957.) Rs. 38; 85*s*.; 11.95 dollars.

SOUND monographs on the major crops are always welcome, not only to those with a specialized or professional interest but also to the general reader. A new work on the coconut palm by Dr K. P. V. Menon, director of the Central Coconut Research Station, Kayangulam, and Dr K. M. Pandalai, joint director of the Central Research Station, Kasaragod, comes into this category. The volume is published under the auspices of the Indian Central Coconut Committee, Ernakulam, South India.

The coconut palm, sometimes styled the 'Tree of Heaven', is still of unknown origin though the best contemporary opinions are in favour of a location in south-east Asia. It now occurs in littoral regions throughout the Tropics. In those regions, for example, India and Ceylon, where it is grown as a major crop, it not only constitutes the general economic basis but also provides many essential and accessory domestic materials. The nut, it need scarcely be said, is the principal article of commerce. According to the authors, the present position in India is that although there is indeed a vast production of nuts, this is still inadequate, and considerable imports of coconut products from Ceylon, Malaya, etc., are essential. After a bad period in the 1930's and during the Second World War, the industry was in a parlous position. To improve matters, the General Coconut Committee was set up in 1945 to take all necessary measures for the improvement and development of the industry. The present volume is one of the results of this new and important effort.

Several books devoted to the coconut have already been published. In the present work use has been made of them and of other relevant information, the overall effect being that the reader is presented with an unusually full and thoroughly documented account of this crop in its many aspects. The opening chapters are devoted to the origin and importance of the coconut, its general morphology, floral biology, varieties, breeding and the effect of environmental conditions. The following chapters deal with the production of quality planting materials, field culture, soil conditions, especially in their nutritive aspects, plantation management and yield. Other chapters are devoted to diseases and pests, of which there is no scarcity. There are also interesting and useful chapters on the tapping of the plant for its juice, curiosities or abnormalities in the development of the plant, and the utilization of its many and varied products. In the final chapter, the many outstanding problems in contemporary coconut research are discussed. In attempts to improve the industry, it need scarcely be said that the introduction of varieties and strains, and a considerable breeding programme, occupy an important place.

The book is very fully documented and well illustrated, some of the coloured plates and photographs being of very good quality indeed. It is hard to avoid the impression that research on the coconut palm is by no means as advanced as it ought to be; but what is known is faithfully presented in the volume under review.

C. W. WARDLAW

HORMONES IN CRUSTACEANS

Endocrine Control in Crustaceans

By David B. Carlisle and Sir Francis Knowles, Bart. (Cambridge Monographs on Experimental Biology, No. 10.) Pp. vii+120+5 plates. (Cambridge: At the University Press, 1959.) 21s. net.

COMPACT books, along with compact cars, provide a welcome relief in some of the more crowded parts of this world. Limited size, but not this alone, contributes to the popularity of the series of monographs of which "Endocrine Control in Crustaceans" is Number 10. Dealing mainly with developments of the past ten years, this book discusses the phenomenon of neurosecretion and contributions to this relatively new field resulting from studies on the Crustacea. Neurones, modified for secretion, have been found in most animals that have been examined, but their organization into systems and the roles of the neurohormones that these systems produce are best understood in the vertebrates, insects and Crustacea. The last-named have three principal types of neurosecretory systems: the so-called sinus gland system, the post-commissural organ system and the pericardial organ system. In each of these, the neurones end on blood spaces and release their products into the circulation, where they are distributed throughout the body to control a wide variety of physiological processes. In this book one finds a discussion of the anatomy of these systems, including fine structure, and the chemical nature and physiological actions of the hormones that they produce.

Since the sinus glands have been shown to consist of groups of nerve endings, modified for storage and release, only the rather recently described Y organs remain as 'true' endocrine glands in the Crustacea. Their role in the control of moulting and their obvious relation to the prothoracic glands of insects are discussed.

The authors point out some of the confusion that surrounds the identification and naming of components of the X organ-sinus gland system. This arises, in part, from the incomplete evidence that the 'sensory-pore X organ' is an important endocrine structure and the apparent desire on the part of some workers to link one important group of neurosecretory cell bodies of the eyestalk, the medulla terminalis ganglionic X organ, with the original X organ complex of Hanström. This matter and others pertaining to crustacean endocrines will be clarified in the next decade by workers who will find this compact book a most helpful résumé of our current understanding of this field.

J. H. WELSH

RENAISSANCE ANATOMY

A Short Introduction to Anatomy (Isagogae Breves)

By Jacopo Berengario da Carpi. Translated with an Introduction and Historical Notes by L. R. Lind, and with Anatomical Notes by Paul G. Roofe. Pp. xi+227. (Chicago: University of Chicago Press; London: Cambridge University Press, 1959.) 37s. 6d. net.

JACOPO BARIGAZZI (c. 1460–1530), or, as he is traditionally known, Berengario da Carpi, was a near-contemporary of Leonardo da Vinci, whose magnificent amateur exploration of the human body stands in fascinating contrast to the work of this competent but uninspired professional. Berengario was a successful physician among the tough characters of Renaissance Italy. Whatever the merits of his medical practice (he cured Lorenzo de' Medici of a skull wound but Cellini reports that he crippled scores of wealthy syphilitics in Rome), he was vigorous, grasping and unscrupulous. His learning in medicine was of the old fashion rather than the new, and his anatomical nomenclature was full of Arabisms which the humanists were soon to replace by Greek terms. In this and other ways Berengario denotes anatomy in transition from the medieval world to the more modern one of Gunther, Sylvius, Vesalius and other expositors of the genuine Galen.

Nevertheless, Berengario is an important figure in the history of anatomy, one who would have been more significant if the pace had not so rapidly accelerated in the next generation. He was certainly experienced, even though his claim to have dissected hundreds of bodies must refer to autopsies rather than scientific dissections. New discoveries and important corrections of traditional errors are attributed to him, and he seems to have performed some original experiments to study the working of the body. His illustrations, though few, are superior to all preceding ones. If these and his text pale in comparison with those of Vesalius twenty years later, Berengario and others show that the study of anatomy was proceeding actively long before Vesalius took up the scalpel.

Berengario's chief work was a Commentary (1521) on the fourteenth-century anatomy of Mundinus. In the following year he published a shorter compendium ("Isagogae breves") of human anatomy. This has now been translated by Dr. Lind, who ten years ago printed an English version of Vesalius' "Epitome". Berengario writes as a practical guide to dissection; thus the student is instructed: "Leave the left kidney in its place until the spermatic vessels are examined. Cut the right kidney in its hollow through the middle, examining the place of the vein and of the great artery itself . . . ." Anatomy is accompanied by brief remarks on the temperaments, functions and diseases of the structures described. The approach is direct, and the object the instruction of beginners. Accordingly, Berengario wrote a text lacking all literary charm and speculative interest, which the translator cannot greatly embellish. In fact, Dr. Lind has adhered rather closely to the original, with a result that is stiff and in some places could mislead an unwary reader. A sentence (referring to the chest) such as "The lateral parts are called ribbed and the sides and the region of the breasts" is common enough in Latin but fails to convey any clear meaning in English. Inevitably the translation abounds in technicalities, some those of the modern anatomist, others long disused. It would have been more convenient to the reader (though more troublesome to the printer) to have supplied notes on the page, rather than in two places at the end of the book. From p. 50, for example, there are two notes on the "guidez veins", one (p. 202) by the anatomical annotator Dr. Roofe simply identifying them with the jugulars, and another (p. 185) by the translator explaining the term at greater length. Some of the figures reproduced are very defective and it is not clear whether they are always found in this poor state.

In other respects this volume is handsomely produced and it is very useful to have such a rare and influential work as Berengario's (issued in English as late as 1660, though, of course, seriously out of date by then) made available in a modern translation. It gives a clear notion of the merits and limitations of Renaissance medical science, and one can only wish that the far more sophisticated works of Vesalius and his successors were equally accessible. For this reason Dr. Lind's translation will be valued by scholars and all who have an interest in the development of medicine.

A. R. HALL

EVOLUTION OF BEHAVIOUR

Behavior and Evolution

Edited by Anne Roe and George Gaylord Simpson. Pp. viii+557. (New Haven, Conn.: Yale University Press; London: Oxford University Press, 1958.) 80s. net.

SYMPOSIA are very much the fashion; and this is understandable enough since the rate of development of the innumerable divisions and sub-divisions of science has now reached such a pitch that the difficulties encountered by a single author in attempting to synthesize and summarize even a very small field of only one science are almost insuperable. However much we come to depend on abstracting services, reviewing and summarizing journals and the like, we are apt to find ourselves faintly pursuing a rapidly receding objective. Indeed, the rate of movement of some branches of science recalls nothing so much as the recession of the extra-galactic nebulæ—we fear communication will be lost, never again to be re-established.

The volume under review is the outcome of two conferences in which thirty-two well-known biologists participated in the attempt to provide an authoritative report on the significance of behavioural studies for the general picture of animal evolution. Many of the writers refer to the fact that you cannot separate behaviour from the mechanisms of behaviour, and that morphology and the adaptation of structures for particular purposes cannot be divorced from the study of the way in which the animal uses those structures. This means strictly that a volume entitled "Behaviour and Evolution" should cover virtually the whole of zoology, from the palæntological record through genetics, embryology and ecology to ethology and systematics and finally anthropology, ethnology and sociology.

Looked at in this way, it is seen that the subject is one for an encyclopædia or a library rather than a single book. This attempt to cast the net so wide, while it has resulted in the provision of a number of interesting and worth-while chapters, has been detrimental to the book as a unit. Scores of other chapters might well have been written. Thus it is interesting and stimulating to read A. S. Romer on "Phylogeny and Behavior with Special Reference to Vertebrate Evolution", and to learn what is known and what is guessed from the study of structure, of the behaviour of Brontosaurus, the Cephalaspids and other palæontological milestones. But this, after all, is stuff which should be found in the elementary textbook and is of doubtful value as a contribution to a symposium volume. Similar criticisms could be levelled at the chapter on "Food-getting Behaviour" by Marston Bates, on the "Axes of Behavioral Comparison" by Henry Nissen and Carpenter's section on "Territoriality". All are interesting in themselves but all attempt to deal with such a wide and elementary field that the task is an impossible one.

What is in need of modern critical summary is the place of behaviour in relation to genetics, in relation to natural selection and adaptation resulting therefrom, and the contribution of behaviour study to the understanding of such matters as isolating mechanisms and the nature of species and other systematic categories. Taking this more restricted view of the subject, the book has a number of excellent chapters which make very rewarding and sometimes exciting reading. The taxonomic aspects of behaviour study are admirably dealt with in two chapters, one by R. A. Hinde and N. Tinbergen and the other by Ernst Mayr. H. T. Spieth has a stimulating section on "Behaviour and Isolating Mechanisms", showing that while behavioural isolating devices are typically innate, they may also contain important learned elements. A penetrating study of the place of behaviour in adaptation as a result of natural selection is contributed by C. S. Pittendrigh. Here, however, the attempt to synthesize seems to have gone too far. It is argued (1) that all organization is relative and directed towards an end; and (2) that the converse of organization is randomness. From this it follows (3) that everything which is non-random must be directed towards an end; and (4) that complexity, organization and adaptation are in the last analysis recognized by virtue of their non-randomness—both of which statements are surely highly doubtful.

The final section, Part 5, "Evolution and Human Behavior", while containing some most interesting contributions, again falls rather outside any central theme that such a book can have. Simpson, in his introductory essay and his epilogue, makes a valiant effort to pull the whole thing together and produce unity out of diversity: a task beyond even him. I believe a more satisfactory result would have accrued had the contributors been fewer in number, had they had longer in one another's company, and had their discussion (carefully edited and revised) been inserted as links binding the whole together.

W. H. THORPE

LINEAR OPERATIONS AND CLASSICAL ANALYSIS

Linear Operators

By Nelson Dunford and Jacob T Schwartz Part 1 General Theory (Pure and Applied Mathematics a Series of Texts and Monographs, Vol 7) Pp xiv+858 (New York Interscience Publishers, Inc, London Interscience Publishers, Ltd, 1958) 165*s*

THE notion of a linear operator (transformation) is familiar to most mathematicians, but the extremely ramified and elaborate theory of such operators, as presented in the work under review, will come as a surprise to many who have not specialized in this field Part 1 alone of the two-volume work covers 850 pages, including more than 100 pages of bibliography However, many different parts of mathematics, particularly hitherto rather isolated branches of classical analysis, are brought together under the strong unifying influence of the theory, and the mathematician who has grown tired of exploring one peak after another may take comfort in coming upon an edifice which acts like an umbrella covering a vast area

Part 1 presents the topological theory of spaces and operators, and the spectral theory of arbitrary operators (the theory of completely reducible operators is deferred to Part 2) Chapter 1 deals with concepts and results from set theory, topology and algebra, and Chapter 2 with the three basic principles of analysis These consist of (*a*) the principle of uniform boundedness, which involves the result that the limit of a sequence of continuous linear operations is continuous, (*b*) the interior mapping principle, which asserts that in the case of certain spaces continuous linear mappings map open sets on to open sets, (*c*) the Hahn-Banach theorem, which is concerned with the existence of extensions of a linear functional Chapter 3 deals with integration and set functions, and Chapter 4 with twenty-eight spaces (mostly Banach) which occur frequently in analysis These include various sequences and the space of all bounded continuous real or complex functions defined on a normal topological space The notion of convexity in a general linear space is treated in Chapter 5 It is shown how various classes of linear functionals determine topologies in a linear space, including a weak topology in a Banach space Special attention is given to the compactness properties and reflexivity of these topologies, and some fixed point theorems are derived In Chapter 6 linear maps between Banach spaces are studied The notions of adjoint and projection operators and also weakly compact and compact operators are introduced and the basic properties of the operators are obtained Representations of classes of operators are given in the spaces of continuous and integrable functions The concepts and methods of Chapter 7 centre around the idea of the spectrum of an operator Earlier chapters are concerned with topological aspects of operator theory, but function theoretic and algebraic methods are used in the spectral theory Perturbation theory covering changes in the spectrum and the resolvent operator is developed, the basic theorem here being due to Rellich Chapter 8, the last of Part 1, is concerned with applications to semi-groups of operators, functions of an infinitesimal generator, and ergodic theory

A question one might well ask, following upon the presentation of so much theory is What does it do ? The answer is contained in the large number of graded exercises, which, the authors point out, are not 'drill' problems but carrying on the text In fact, they present the applications of the theory to familiar branches of classical analysis, including summability of series (Chapter 2) and integrals (Chapter 4), orthogonal expansions, particularly Fourier series (Chapter 5), and inequalities (Chapter 6) It is interesting to note, and indicative of the power of the theory, that convexity methods, depending largely on the Reisz convexity theorem, may be used to derive many of the most familiar and important inequalities of analysis

"Linear Operators" is encyclopædic in character and will probably become the standard reference text in its field Parts of it may also be used in courses for both undergraduates and those entering upon research In a work of this size material tends to become buried, but there is a detailed subject index which will help to prevent this and the "Notes and Remarks" at the end of each chapter form a very good guide to the extensive literature

L S GODDARD

MATHEMATICS AND OPERATIONS RESEARCH

Mathematical Methods of Operations Research

By Thomas L Saaty Pp xi+421 (London · McGraw-Hill Publishing Company, Ltd, 1959) 77*s* 6*d*

OPERATIONS research, which is now generally regarded as a well-defined field of activity moving in its own right, began life in unusual circumstances The impact of war produced many practical problems, both tactical and strategic, which had to be solved, often within a limited time and with a limited amount of information as data Men, whose basic training had been in different scientific fields, were put together in teams and their task was to formulate and solve the problems inherent in the practical situations at hand The result was highly successful, and thus operations research was born In the post-war years activity has developed greatly on the industrial side In addition, there has been time for a mathematical penetration of the subject to occur, and the use of mathematics in this field forms the subject-matter of the book under review

There are four parts, the first being a discussion of a varied collection of topics, including scientific method, logic, and the building of mathematical models Parts 2 and 3 deal with the more serious mathematical methods of operational research, and cover optimization and programming (both linear and quadratic), the theory of games, probability, statistics and the theory of queueing These two parts form the core of the book and take up about three-quarters of the volume They are well written and will give the graduate mathematician a good introduction to operational research problems and the sort of mathematical methods needed in their solution The chapter on queueing is an excellent summary, and it is a pity that it has not been expanded to deal with the subject more fully One printing error has been detected on p 340 the exponent of μ/λ in the second term of the expression for $P_n(t)$ should be $-n-1$ and not $-n+1$

The fourth part of the book will probably be a surprise to most readers It is an essay entitled "Some Thoughts on Creativity" As the title may suggest, it is largely concerned with the psychology of personality and motivation , creativity, in fact, is defined as "the element of the human personality which provides direction" To the reviewer the essay has proved disappointing, and it seems out of place in a book on mathematical methods The author remarks that "it is difficult to write about general creativity" but has included the essay because it was successful in teaching It would almost certainly increase the value of the book if, in a future edition, the essay were replaced by, for example, a more extended treatment of queueing or production and inventory problems In spite of these remarks, the book should prove valuable both to mathematicians who wish to take up operational research and to industrialists who wish to read something of what operational research can do and how mathematics is becoming more and more an indispensable tool in this field

L S GODDARD

MECHANICAL IMPEDANCE METHODS IN VIBRATION

Colloquium on Mechanical Impedance Methods for Mechanical Vibrations

Presented at the ASME Annual Meeting, New York, N Y , December 2, 1958 Edited by R Plunkett (Sponsored by Shock and Vibrating Committee Applied Mechanics Division) Pp vi+145 (New York The American Society of Mechanical Engineers, 1958) 5 50 dollars

THE basic theory of linear mechanical vibration has been in existence for many years Unfortunately, in some respects that theory is not in a convenient form for use in modern vibration analysis Much effort has therefore been put into re-casting, tabulating, re-examining and extending the known results of vibration theory It has been found very useful in doing this to borrow ideas which have been developed by electrical engineers for use with a c circuits Although it was realized at the beginning of the century[1] that there is such a thing as 'mechanical impedance', the great practical importance of the idea has only become apparent within the past twenty years

There are several ways of developing impedance techniques One may either relate harmonic displacements to a harmonic input force or, alternatively, one may relate velocities to the force , some workers prefer to think of accelerations in terms of harmonic forces In addition, there is the possibility of measuring the displacement (velocity, or acceleration) per unit amplitude of force or of measuring forces per unit displacement (velocity, or acceleration) The upshot is that several schools of thought have come into being Few authors (if any) are prepared to think in terms of more than one of these concepts and consequently the literature is becoming difficult, to say the least

The existence of this rather unsatisfactory state of affairs was the reason for my interest on receiving this work For it is high time that some body such as the American Society of Mechanical Engineers (which sponsored the publication) set about straightening things out Unfortunately, the book fails to do this, although its avowed purpose is "to present the state of the art of impedance methods (by presenting) a survey of what has been accomplished to date"

This book contains a dozen papers, most of which have a good deal of technical interest over a fairly narrow range of the general subject of vibration But there is no attempt to organize the methods used, and indeed more techniques than one are employed in the book I believe that much of this book will be of real interest to practitioners , it will be found wanting by those who are not primarily concerned with specific aspects of vibration analysis but who want to know what impedance methods have to offer

At the risk of confusing the issues still further, I would like to make certain comments on the general subject of impedance methods in vibration theory In the first place, it seems evident that both velocity and displacement techniques are of real practical value Moreover, it is true that, at least to some extent, it is a matter of taste which is adopted (What seems much more debatable is whether one should work with displacement (or velocity) per unit force or force per unit displacement (or velocity)—'admittance' or 'impedance', so to speak) The case for working with acceleration appears to be rather weak

The late H G Yates[2] showed that there are physical reasons for describing the vibratory behaviour of systems in terms of velocity of vibration Incidentally, credit for this is not given in the book although it is a vital contribution in support of the use of the velocity measurements which are favoured by the majority of the contributors

There also appears to be an advantage in using velocity calculations and measurements where high frequencies are concerned (say, more than 500 c /s) High-frequency problems are encountered at the boundary between mechanical vibration and acoustics A great deal of work is being done nowadays on the silencing of machinery in submarines, and here is an excellent example of where impedance methods may very well be superior , this is because of the requirements of acoustical theory, where power transmission must be considered

Many workers advance the existence of an analogy between mechanical systems and a c circuits as being a fundamental reason for using velocities For, by so doing, one preserves the analogy This argument is not as powerful as it may seem, however, since the ability to construct an electrical analogue of a mechanical system implies that the mechanical system is a completely known one Mechanical systems are usually far less tractable than ordinary low-frequency a c circuits But, here again, the velocity approach does come into its own where compound systems, embodying mechanical and electrical components, are concerned

The claims which may be made for displacement methods completely outweigh those for velocity, however, at low frequencies in the vast majority of vibration problems At least this is my opinion For one thing, it is unnatural to think in terms of a fluctuating velocity rather than a fluctuating displacement Physical insight is absolutely vital in the solution of practical vibration problems This is reflected in the book under review in a rather remarkable way , there is no discussion of dynamic instability although this is an obvious field for use of the displacement approach[3]

Another shortcoming of velocities is that they are not as convenient for use in conjunction with Lagrange's equations The matrix equation

$$\mathbf{A}\mathbf{q} + \mathbf{B}\dot{\mathbf{q}} + \mathbf{C}\mathbf{q} = \Phi e^{\lambda t}$$

relating to a system having n degrees of freedom has to be expressed as a form of integral equation if it is couched in terms of generalized velocities ($\mathbf{A}$, $\mathbf{B}$ and $\mathbf{C}$ are the square inertia, damping and stiffness matrices, respectively, $\mathbf{q}$ is a column matrix of generalized displacement and Φ is a column matrix representing amplitudes of generalized applied forces, λ being a complex constant) Some idea of the sheer power of the displacement approach may be had from Duncan's pioneering work[3], much of which has no counterpart in the literature as it relates to the velocity outlook

To be sure, the choice between these techniques is to some extent—perhaps largely—a matter of taste But to regard this as being entirely a matter of taste would be obtuse A critical appraisal of the present position, particularly in the light of recent work in automatic control, is still highly desirable

FRICTION IN TEXTILES

Friction in Textiles

By Dr H G Howell, K W Mieszkis and Dr D Tabor Pp xii+263 (London Butterworths Scientific Publications, New York Textile Book Publishers, Inc, 1959 Published in association with the Textile Institute) 42*s*

IN a traditional industry, such as the textile industry, practice has been and, in many aspects still is, ahead of theory This situation has arisen because able men have had an abundance of time to solve technical problems empirically During the past few decades, however, a host of new problems has been presented to the textile industry These problems arise from three main factors the advent of man-made fibres, in both continuous filament and staple form, the increasing cost of labour and the increasing emphasis on, and uniformity of, quality The consequences of these changes are the introduction into the industry of high-speed machinery, of control instruments and of an increasing number of scientifically trained men The Textile Institute is therefore to be congratulated for encouraging the publication, in association with the publishers, of books which relate textile technology to the background of scientific knowledge

The first result of this association is the publication of the book "Friction in Textiles" This book is in three sections, the first one is a readable summary of current views on friction, in which the limitations as well as the successes of current theory are given a just emphasis The second part, entitled "Friction in Textile Processing", contains an account of the special frictional properties of wool, followed by chapters on the importance of friction in the different processes through which fibre passes on its way to the finished cloth It is a measure of the current state of knowledge that all the textile processes can be dealt with in less than sixty pages, compared with twenty-one on the frictional properties of wool and about seventy in the third section of the book, on methods of test

Scientifically and technologically, the middle section of the book is least successful Its value, however, is probably greater for the textile technologist than that of the first and last sections, because it represents a brave attempt to give a coherent account, based on the little data available, of a dominant factor in textile processing, namely, friction The reviewer hopes that textile scientists will read this and be stimulated to carry out the research which is so clearly necessary

ADVANCEMENTS IN METALLURGY

Constitution of Binary Alloys

By Dr Max Hansen Second edition prepared with the co-operation of Dr Kurt Anderko (Metallurgy and Metallurgical Engineering Series) Pp xix+1305 (London McGraw-Hill Publishing Company, Ltd, 1958) 252*s*

Metallurgical Thermochemistry

By Dr O Kubaschewski and E Ll Evans (International Series of Monographs on Metal Physics and Physical Metallurgy, Vol 1) Pp xiv+426 (London and New York Pergamon Press, 1958) 63*s* net

Vacancies and Other Point Defects in Metals and Alloys

A Symposium organized by the Institute of Metals and held at the Atomic Energy Research Establishment, Harwell, Berks, on 10 December 1957 (Institute of Metals Monograph and Report Series, No 23) Pp iii+234+16 plates (London Institute of Metals, 1958) 40*s*, 6 dollars

Vacuum Metallurgy

Lectures presented during the course on Vacuum Metallurgy sponsored by the Department of Metallurgical Engineering in co-operation with the Office of Special Service to Business and Industry, New York University, New York, June 10–14, 1957 (Materials Technology Series) Pp xviii+472 (New York Reinhold Publishing Corporation, London Chapman and Hall, Ltd, 1958) 100*s* net

A Dictionary of Metallurgy

By Dr A D Merriman Pp xv+401 (London Macdonald and Evans, Ltd, 1958) 126*s*.

THE rate of growth of metallurgical knowledge and experience is resulting in a flow of publications covering many diverse fields from many countries and, it must be admitted, of widely differing quality The five books here reviewed are, however, valuable contributions to their own fields of science or technology

The first German edition of Dr Hansen's "Constitution of Binary Alloys" was published in 1936, and immediately gained for itself an honourable place in all laboratories where work on metallic alloy systems was being pursued With the passage of years this edition became progressively less complete and this new and up-to-date one is, therefore, most welcome This second edition is in many respects a completely new work, the text is now in English, the diagrams themselves are plotted on a linear scale of atomic per cent with a non-linear weight per cent scale at the top and the layout of the text is such as to direct the reader to the original literature As before, the diagrams are compiled from what the authors regard as the most reliable work available and regions of uncertainty are denoted by broken lines More attention is given to structural details and reference is made to lattice spacing investigations In its new form this is a quite outstanding publication

Dr Kubaschewski's "Metallurgical Thermochemistry" is in its third edition, and is a book which has clearly filled a real gap in scientific literature, appearing only three years after the second This in itself is sufficient evidence of its quality It is now firmly established as a standard work, and it is pleasing to note the critical assessment which is its characteristic feature. A few alterations in matters of detail have been made to the text of the second edition, and the tables have again been brought up to date

The symposium, "Vacancies and Other Point Defects in Metals and Alloys", is notable for two very distinguished contributions, first a paper by Prof A H Cottrell on "Point Defects and the Mechanical Properties of Metals and Alloys at Low Temperatures," and secondly, one by Dr D McLean on "Point Defects and the Mechanical Properties of Metals and Alloys at High Temperatures". Dr T. Broom and Mr R K Ham review the effect of lattice defects as revealed by studies of deformation and annealing experiments, particularly in relation to stored energy and electrical resistance measurements Dr W. M Lomer gives an elegant review of the defect aspects of solid state diffusion, Dr P L Pratt contributes an account of defects in relation to the mechanical properties of ionic crystals and Mr E C Williams and Mr P C S Hayfield, in what is possibly the least satisfactory contribution, attempt an analysis of surface oxidation processes The discussion of a rather general character is printed in full with illustrations

In 1957, the University of New York organized a symposium on "Vacuum Metallurgy", the twenty-eight papers presented at which are now published The authors, from Europe and the Soviet Union, as well as from America, have covered a very wide field and the importance which vacuum techniques have assumed is abundantly demonstrated It will, for example, come as a surprise to many readers to learn that masses of steel 150 tons in weight are now subjected to such treatment That the newer metals titanium, zirconium, etc, which little more than a decade ago were laboratory curiosities, are now fully fledged engineering materials must in the main be credited to the successful application of vacuum technology On the economic plane, too, it must not be overlooked that, expensive as such techniques are, a vacuum is at times not only the best but may also be the least expensive 'atmosphere' that may be used The scope of the individual contributions includes vacuum equipment and the thermodynamic and kinetic aspects of the subject, melting processes (including a later addition of a paper on electron bombardment melting), degassing in both the liquid and solid states; distillation and other metallurgical applications Special analytical techniques may be required, especially for gaseous impurities, and these are considered, while the final chapter is an attempt to foresee future trends There is an extensive bibliography and an adequate index In assessing this important book, and the adjective is not undeserved, credit should be clearly given to the editor, who has done his job very well indeed

The work required in the production of "A Dictionary of Metallurgy" must have been immense, and although it is, as its name implies, a dictionary and not an encyclopædia, it will be a valuable book of reference on many bookshelves The field of metallurgy is now very wide indeed, and its divisions so diverse, that no one can hope to be conversant with them all Questions outside one's own range of knowledge must at times crop up and such a source of reference as this has, therefore, a value even to a metallurgist of considerable experience To those less well versed in the science and technology of metals it should be even more useful

F C THOMPSON

NUCLEAR ENERGY AND MEDICINE

Medical Sciences

Vol 2 Edited by J C Bugher, J Coursaget and J F. Loutit (Progress in Nuclear Energy, Series 7) Pp viii+288+xii (London and New York Pergamon Press, 1959) 105*s* net

Advances in Biological and Medical Physics

Vol. 6 Edited by Cornelius A. Tobias and John H Lawrence Pp ix+639 (New York Academic Press, Inc, London Academic Books, Ltd, 1959) 16 50 dollars

THE first of these books presents selected papers from the sessions relating to the medical sciences of the Second International Conference on the Peaceful Uses of Atomic Energy held in Geneva in September 1958 The selection has been made mainly from the sessions on radiological protection and the second session on the uses of isotopes in medicine The sessions on biology, physiology and biochemistry are covered by a separate volume

The papers included in this volume may be divided broadly into three groups First there are papers which will be chiefly of interest to health physicists, including two papers on the protection of workers in industrial establishments handling nuclear fuels, with other papers on the detection of ingested isotopes by external γ-ray spectrometry, and on the detection of plutonium in wounds and on the treatment of cases of plutonium ingestion There are also two papers on the metabolism of cæsium-137 and strontium-90

The second group of papers is of more general interest One deals with the lack of any measureable difference in life expectancy of radiologists in Britain and comparable groups of people not occupied in radiological procedures Another concerns the distribution in the incidence of bone tumours in North America in relation to the level of natural radiation, and a third paper deals with the radiation dose required to produce bone tumours, in so far as this can be determined in humans following radiotherapy and also from work with experimental animals

The final group is of more direct medical interest, dealing with various aspects of radiotherapy, including papers on neutron capture therapy, on the use of cyclotron-produced heavy charged particles, as well as on various techniques using γ-ray sources In addition, there is a paper on the mitigation of radiation effects in patients by leukocyte and thrombocyte transfusions and also one on new developments in radiation protection and recovery in experimental animals

The papers selected bear out the opinion of the editors that although few radical advances have occurred in this field since the previous Conference, there has been considerably more thought put into the subjects It is unlikely that the reader will be interested in all the papers presented, but the book as a whole does reflect one aspect of this Conference

The second of these books is the latest volume in this series, published yearly, presenting various topics by leading experts in the fields covered The previous high standard of the series has been maintained and some of the chapters are very good indeed, particularly those of the review type such as the effects of ionizing radiation on tumours in experimental animals, by O C A Scott , ion and water transport in the stomach and intestine, by R P Durbin, P F Curran and A K Solomon , and isotopic tracers in the study of diabetes, by S A Berson and R S Yalow A real attempt has been made by the writers to present these topics clearly and in a straightforward manner Other chapters deal with methods for increasing radiological contrast, radiobiological aspects of the induction of lysogenic bacteria to produce phage, physical and chemical mechanisms of cell injury by ionizing radiation, artificial and induced periodicity in living cells, microspectroscopy of cells, measurement of the regional circulation in the nervous system using a radioactive inert gas, the effect of ultrasound on the nervous system and a very mathematical presentation of the application of light scattering to biological systems

The inclusion of a chapter on fall-out from nuclear explosions which is of such concern nowadays does not achieve the same standard as most of the other chapters The actual mechanism of long-range fall-out over the surface of the Earth, which is now beginning to be understood, receives little attention In considering the biological hazard the author has not succeeded in clarifying this confused and much debated question

The book will be of greatest value in a library where it is available to readers interested in the twelve very different topics covered, but the individual reader may well find the book worth buying for the sake of the wider review articles alone

N M BLACKETT

DERBYSHIRE PLACE-NAMES

The Place-Names of Derbyshire

By Kenneth Cameron Part 1 Introduction, River-Names, etc , High Peak Hundred Pp lxxiv+1–186 Part 2 Scarsdale Hundred, Wirksworth Hundred, Morleyston and Litchurch Hundred Pp vi+187–514 Part 3· Appletree Hundred, Repton and Gresley Hundred, Analyses, Index Pp viii+515–829 (English Place-Name Society, Vols 27, 28 and 29) (Cambridge At the University Press, 1959) 35*s* net each volume

THIRTY-FIVE years ago the English Place-Name Society published its first introductory volume and thereby began its great task of recording and interpreting the place-names of England With the appearance of "The Place-Names of Derbyshire" it has now published the material for twenty counties

In Part 1 of this three-volume work, Dr. Cameron begins with a most interesting introductory essay which shows how place-names may be used to help reconstruct the process and progress of settlement from Roman times onwards Thus, for example, we learn that "A small and remarkable group of [four] names indicates that men of Irish–Norwegian descent also settled in the county" The two places named Ireton both mean "the farm of the Irishman or Irishmen" and contain as a first element the ON *Íri*, the term used of a Viking who had been in Ireland before coming to England or of Irishmen who accompanied the Vikings to England of the two other names in this group, "Mammerton has, as its first element, a Goidelic personal name *Maelmuire*, and Mercaston, a British name *Merchiaun* found in north-west England" Similarly, Dr Cameron also shows that elsewhere the Scandinavian settlers in Derbyshire were mainly of Danish rather than of Norwegian origin

This place-name evidence is clearly of great importance, and it is therefore all the more unfortunate that the six distribution maps of selected place-name elements do not adequately support the text because relevant detail is often omitted, as the map of certain woodland elements shows "The former heavily wooded nature of parts of the county, and the almost complete absence of woodland in others, is indicated in a striking way by the distribution of place-name elements . which are descriptive, either of the woods themselves, or of settlements in woodland" The subsequent elaboration of this statement quite rightly relates the former distribution of woodland to relief and geology— how much more revealing would the map have been if, besides four place-name elements and the main rivers, it had also included a few selected contours and the outcrops of the Carboniferous and Magnesian Limestone and the Millstone Grit

Most of the remainder of Part 1, all of Part 2 and the first half of Part 3 contain the details of the individual names arranged first according to hundreds, then within each hundred in alphabetical order of parishes, and within each parish the more important names first followed by minor names and field-names The extensive use of abbreviations within this section has allowed a tremendous amount of information to be packed into a relatively small compass, and by making frequent reference to the detailed account of the elements to be found in the separate volumes on place-name elements (English Place-Name Society, Vols 25 and 26) still more space has been saved It is unfortunate, however, that, especially with minor and field-names, it has all too often been found necessary to omit any explanation of the meaning of the name For example, of the twenty-five minor names included for the parish of Totley, no explanation is given for a third of these

The second half of Part 3 contains interesting and valuable analyses both of the elements found in Derbyshire place-names and of the different types of names themselves, and these are followed by two comprehensive indexes covering the material in all three volumes

Despite minor blemishes, the work is a monument of patient scholarship and, to all interested in Derbyshire and in place-names, these volumes are indispensable.

I S MAXWELL

A PHYSICAL BASIS FOR LAND USE POLICY IN TROPICAL CATCHMENT AREAS

By Dr H C PEREIRA

East African Agriculture and Forestry Research Organisation, Muguga, Kenya

THE rapid rise in the standard of living of much of the world's population over the past few decades has caused many countries to give anxious consideration to their future water supplies Even in Great Britain the problems of water supply and demand are requiring increasing attention[1] In comparison with the advance of science in other fields the techniques for the study of the water relationships of catchment areas are somewhat undeveloped In the United Kingdom there is much controversy about the hydrological effects of the afforestation of the hillsides the run-off of which supplies the big cities In middle-western States of America the management of natural forests which cover the mountain catchment areas has been the subject of fierce controversy between irrigation, grazing and timber interests

In the high-altitude tropics the development of the forested high ground for production of softwoods and other valuable plantation crops gives rise to similar problems which face the modern administrator with difficult decisions Established facts and techniques are scarce Moreover, they have been derived in a variety of geographical environments and involve many scientific and technological disciplines As a result, trenchant arguments by specialists concerned with limited aspects of these problems cause confusion, and there is growing public concern at the rate at which cities in many countries are outgrowing their traditional water supplies

The basic climatic factors of amount, intensity and seasonal distribution of rainfall, together with the amount and seasonal distribution of evaporation, set the boundaries to these problems Although this is an elementary statement of fact these boundaries are often ignored in arguments seeking to apply findings in one country to problems in another The physical principles are relatively simple The routes by which rainfall, arriving in excess of the prevailing evaporation rates, can reach a stream are classified by hydrological analysts into three categories immediate overland run-off, delayed subsurface flow through the porous soil of the plant root zone, and ground-water flow from porous aquifers beyond the depth of plant roots

The relative importance of these three routes by which rainfall becomes stream-flow is determined by the character of the rainfall distribution In mild climates of well-distributed rainfall, the overland route may be entirely acceptable It is, for example, the principal means of filling many reservoirs in the United Kingdom, where shallow-soiled catchments are, under well-managed sheep pasture, capable of delivering clean run-off water Where reservoir capacity is adequate, infiltration can then be of secondary importance, so that heavily grazed pasture can be a satisfactory catchment area cover

In the colder climates the hydrological performance of mountainous catchments may be dominated by the trapping and storing of snow and by its rate of melting, so that forest management practices become of dominant importance Reservoirs of high capacity are necessary to avoid loss of the snow-melt flood-water which is confined by frozen subsoil to the overland and sub-surface routes

The high-altitude tropics of Africa present a contrasting set of problems Here few of the newly developing communities can afford the very large structures which would be required to store overland flow from the strongly seasonal rainfall Here also the high rainfall intensities cause destructive acceleration of erosion wherever run-off is unchecked Overland flow is thus an entirely unacceptable route, and infiltration is the critical factor for the continuity of water supplies throughout the dry seasons These supplies must depend upon the seasonal recharge of the ground-water reservoirs which maintain spring-flow Fortunately, tropical weathering has produced soils which are very deep and characteristically porous, so that, provided the land use is controlled to secure the maintenance of high infiltration rates at the soil surface, the dry-weather flow can be sustained

These conditions apply throughout most of British East Africa, where the over-riding technical consideration in determining land-use policy for a catchment area must be the maintenance of dry-weather stream-flow Where political considerations, shortage of technical staff, or plain administrative weakness has permitted gross violation of this principle, with consequent destruction of soil resources by overgrazing or by primitive cultivation methods, this is now known beyond doubt to be a short-sighted policy which will impoverish future African generations

Where man has not destroyed it, a continuous canopy of forest covers most of the important high-rainfall catchment areas of tropical Africa within which the major permanent streams arise Determination of the optimum land-use policy for these catchment areas poses two main questions of principle First, is the natural forest the most efficient catchment-area vegetation from the criterion of dry-weather stream-flow ? Secondly, since these well-watered areas of deep fertile soil can be, under modern plantation techniques, among the most productive in Africa, can they also be successfully managed for both stream-flow and agriculture or plantation forestry ? Where territorial income depends primarily on agriculture and forestry, the first priorities for investigation must be the most productive forms of land use

Studies of the performance of large catchments under mixed forms of land use have been shown in the United States to yield relatively little precise information, even when continued over many years To be fully effective, this type of research must comprise intensive measurements of the water cycle during controlled land-use changes on complete catchments, and continuous comparison with adjacent unchanged control catchments If the new land usage is to increase the productive wealth of the territory, then substantial investment of capital and the application of commercial skill and experience are necessary, either through private enterprise or State development This places such schemes beyond the usual resources of the specialist research worker, and indeed the urgency for correct solution of these catchment area problems necessitates the support and active interest of governments at ministerial level.

The immediate questions asked by responsible administrators must be "What will it cost ?" and "How long will it take ?" Experience in British East Africa at present suggests that the costs can be kept very low by combining development of either government or private large-scale enterprises with research into their effects Most of the rich forested catchments are already under Forest Reserve or Crown Land protection, and release of the necessary areas for experimental land-use changes can be made contingent on the preservation of control valleys and the maintenance of agreed schedules for clearing and development

These problems can be solved only by combining the scientific knowledge and experience of agricultural and meteorological physicists, hydrological and soil conservation engineers, foresters, geologists, agronomists, topographical and soil surveyors, and particularly in Africa, by the active co-operation of the administrative authorities The research itself needs only a small team of full-time workers with whom the many technical officers of government departments and of commercial enterprises can co-operate The urgent need that factual information about changes in water regimes should be won while the choice of land-use alternatives can still be made is best appreciated by those most actively concerned with the development of Africa, the ready co-operation of the more enlightened administrators, together with their technical advisers, is therefore the rule rather than the exception

The length of time required to secure a reliable result has, in the past, been a main obstacle to the initiation of this type of research The 'classical' method has been to compare annual stream-flows of pairs of valleys over periods of 10–20 years, in order to provide a statistical basis for subsequent study of a land-use change on one of each pair Since a similar run of years is then needed under the new land use, the time required is inappropriate to countries which have already crowded into fifty years the developments which took centuries in the older temperate-zone communities The classical method is also vulnerable to those extreme spells of departures from average rainfall which can occur by chance without postulation of weather cycles Kerrich[2] has illustrated how successive departures from the average occur by chance in genuinely random data

Fortunately we have most favourable combinations of meteorological and geographical circumstances in the high-altitude tropics which offer facilities for measurement which are unmatched in temperate zone hydrology Our freely drained uniform stone-free soils, usually ascribed to the effects of Pluvial era leaching, have astonishing depths ranging from 10 to 60 ft on many major catchment areas They are underlain, in a few selected areas, by impermeable lava flows Strongly marked wet and dry seasons ensure the substantial depletion and recharge of the soil within the root ranges of forest, pasture or crops These changes are readily followed by occasional extensive deep samplings, linked by the records of electrical resistance tensiometers, they thus afford unique opportunities for the direct measurement of evapotranspiration Based on these periods of direct measurement, the energy balance method of Penman, which has solved the hydrological balance for many catchments in the United Kingdom[3], extends the numerical estimate of evapotranspiration to the complete water year Fully equipped meteorological stations, including radiation measurements, are therefore operated on the site of each experiment The seasonal totals of rainfall, evapotranspiration and stream-flow are thus obtained independently, and the hydrological balance is completed by the measured water storage changes in the first 10 ft of soil, within which the major seasonal depletions occur Changes in the ground-water storage, between the 10 ft depth and the stream, are calculated from the running water budget of the first 10 ft [4] and the measured stream-flow

These favourable circumstances afford opportunities for earlier information on changes in water regimes, the time required to obtain results depending mainly on the rate of development of the new form of land use Mechanical equipment, backed by the large and well-organized labour forces of modern plantation industries, can ensure rapid development[5] Growth-rates, moreover, are high in the tropics so that pastures, tea, coffee, cocoa or softwood plantations rapidly establish their canopies and root ranges, by which their main hydrological effects are achieved In the arboretum of the East African Agriculture and Forestry Research Organization, for example, 6 species of *Eucalyptus* have grown more than 40 ft tall and 5 in in diameter in four years after planting[6] A pasture grass, *Cynodon dactylon*, planted from splits on 8 acres of fallow soil containing 12 replicate profile sets of electrical resistance tensiometers developed roots to a depth of 10 ft in 12 months and heavily depleted the soil moisture to this depth[7]

Four co-operative inter-departmental studies based on these methods are in progress in British East Africa The land-use changes under study are first, the conversion of indigenous bamboo forest to softwood plantations in the catchment areas of the Aberdare Mountains, from which the city of Nairobi draws its water supplies for a quarter of a million inhabitants, secondly, the conversion of indigenous tall rain forest to tea plantations in an area from which the streams supply a well-developed existing tea industry and a large area of African peasant agriculture[8], thirdly, the effects of the opening and closing phases of shifting peasant agriculture in steep mountain valleys as compared with the indigenous forest cover, fourthly, the conversion of over-grazed thornscrub to rotationally grazed pasture, in semi-arid catchments which at present produce only torrent flow.

Only stencilled progress reports have as yet been issued, but detailed analyses of the data of the first two years are now being prepared for publication

These show similar behaviour from dense 40 ft high bamboo forest on the Kinangop Mountain on the Aberdares (lat 0° 45′ S) and from heavy 100 ft high rain forest on Sitoten Mountain in the Lake Victoria catchment (lat 0° 20′ S) Both are at altitudes near 8,000 ft and receive 70 in or more of total annual rainfall In each case infiltration rates are equal to those of the heaviest storms, and no surface run-off is perceptible The first 10 ft of deep porous soil remain continuously wet and evapotranspiration remains at or very near full potential Measurements so far indicate that evapotranspiration rates approach, and are at times fully equal to, those of open water These wet forested valleys are hydrologically more similar to lakes than to usual land surfaces The stream-flow yields differ as a result of the very different ratios of rainfall to evaporation rates, varying from annual totals of 15 per cent of rainfall in the warmest of the valleys to 56 per cent of rainfall in the coolest

In the warmest of these forests, where evaporation is more than 55 in per annum, the soil moisture tension throughout the first 10 ft depth has remained below 1 atmosphere for the 2 years of observations Tension-plate and pressure-plate measurements on undisturbed soil cores have shown a total storage capacity of 20 in of available water in this depth, but periodic sampling has shown that moisture deficits have not yet exceeded 10 in The fluctuations in soil moisture storage have equalled the total annual stream-flow from this 1,750 acre valley, which indicates the importance of the quantitative soil moisture budget[4] in the water cycle An example of the favourable nature of these soils for water measurement is given in Table 1, which compares the moisture contents found by periodic sampling under 'field capacity' conditions with the laboratory determinations made on undisturbed soil cores

This uniformity of physical conditions throughout the soil profile is characteristic of many important catchment areas in East Africa and persists to great depths, up to 60 ft of developed latosol being shown by some borehole records The reproducibility of this measured 'field capacity' permits the calculation of the drainage contribution to ground water[4]

At altitudes of between 8,000 and 9,000 ft the heavy rain forest gives place to a dense cover of bamboo (*Arundinaria alpina*), and in this zone the development of a very large softwood industry is in progress After some 30 years of measurements on sample plots and small plantations by the Kenya Forest Department, the Ministry of Forests has begun large-scale development, designed to provide employment for Kikuyu families displaced by the Mau Mau emergency For ten years the comparative water use of bamboo and of softwood plantations has been studied by this Organization in co-operation with the Kenya Forest Department[9], the evidence has been adequate to indicate that no hydrological ill-effects would be likely to follow replacement of bamboo by softwoods The first major scheme was, however, sited in the catchment area of Nairobi City's future water supplies, and plantation therefore began with the development of experimental catchments

Table 1 FIELD CAPACITY UNDER TALL RAIN FOREST
(A latosol weathered *in situ* from phonolite)

Depth (ft)	Range (in)	Soil cores at tension of 1/3 atm		Sampling results		
		Moisture (per cent dry weight)	Inches of water	April 1958	July 1958	June 1959
Surface	0–6	69 9	2 45	3 08	2 59	2 89
At 1 ft	6–18	62 7	5 02	4 66	4 92	4 82
At 2 ft	18–30	58 0	5 34	5 18	5 29	5 24
At 3 ft	30–42	53 9	5 23	5 41	5 45	5 50
At 4 ft	42–54	56 7	5 39	5 26	5 29	5 41
At 5 ft	54–66	57 0	5 70	5 58	5 74	5 61
At 6 ft	66–78	57 1	5 60	5 48	5 41	5 25
At 7 ft	78–90	55 8	5 58	5 49	5 40	5 45
At 8 ft	90–102	55 4	5 60	5 55	5 60	5 53
At 9 ft	102–114	55 6	5 62	5 82	6 07	5 68
At 10 ft	114–126	57 6	6 05	5 93	5 12	5 95
Total for 10½ ft depth			57 58	57 44	57 88	57 33

Observations are at present near the end of the second 'water year', between successive September–October seasons of minimum stream-flow In 226 wet days of the first water year, a total of 100 45 in of rainfall over the bamboo had kept the soil continuously wet, the electrical tensiometers showing no soil moisture tensions above 2/3 atmosphere between the first and tenth foot depth

Two evaporation pans, one, raised, and the other sunken but air-insulated[10], gave totals of 48 57 and 49 58 in respectively, while the Penman formula, using sunshine hours, gave 54 83 in Sunshine hours give a somewhat inadequate account of the radiation under these typical mist-forest conditions, and substitution in the Penman formula of direct measurements of radiation by the Gunn–Bellani distillation instrument[10] gave an evaporation estimate of 48 82 in , in remarkably good agreement with the pan measurements

The comparison of the forested and cleared valleys is summarized briefly in Table 2

Table 2 COMPARATIVE WATER YIELDS OF BAMBOO FOREST AND FIRST YEAR OF CULTIVATED CLEARING

Annual totals	Valley *C* (161 acres, undisturbed bamboo forest)	Valley *A* (87 acres, cleared and clean cultivated for vegetables)
Rainfall	100 45 in (from 9 gauges)	93 34 in (from 10 gauges)
Stream-flow	56 78 in	65 10 in
Water yield	57 per cent	69 per cent
Water loss	43 67 in	29 24 in
Measured evaporation	49 00 in	49 00 in
Ratio $\frac{\text{evapotranspiration}}{\text{open water evaporation}}$	0 9	0 6

Confirmation that evapotranspiration from this bamboo forest approaches and sometimes equals potential open water evaporation rates has been obtained in the preliminary local experiments, so that the ratios obtained in Table 2 are in accord with previous experience

The saving in water yield was thus about 12 per cent of the rainfall in the first year after clearing This saving was achieved under a clean-tillage form of land use, in which the potatoes, peas, beans, etc , covered only part of the soil surface for part of the time

This is a rather small saving in comparison with the 27 per cent of a 62 in rainfall reported by Hoover[11] as gained by clear-felling a mixed hardwood forest in the colder conditions of the Appalachian Mountains The difference is probably due to the rapid establishment of crops or weed cover under tropical conditions Soil moisture sampling where clear-felling had not been followed by clean tillage showed that the very rapid growth of tall herbs (*Leonotis* sp , *Sambucus abyssinica*, etc) had depleted the first 6 ft of soil by 6 in of water during a severe dry season in the first year after felling[9]

This aspect is sometimes overlooked by engineers in search of increased water supplies Suggestions that water supplies may be improved by felling trees on tropical catchments pre-suppose that an alternative form of vegetation affording equally effective protection from erosion can be economically maintained, from experience with the comparatively shallow-rooted grasses of temperate-zone catchment areas, a grass cover is often strongly advocated

It is planned to change one of the bamboo forest catchments to sheep-pasture in order to make this comparison, but the climax indigenous grass species, which rapidly invades and defeats all others planted in this area, is *Pennisetum clandestinum* or Kikuyu grass A local farming observation at 7,000 ft altitude has been that when a valley which gave rise to a permanent stream was cleared of bush and planted with this grass, the stream dried up and has remained dry for 15 years of permanent pasture Washing out of grass roots showed that they entered decomposed lava at a depth of 19 ft Detailed soil moisture studies to a depth of 15 ft for 5 years in the catchment of the dried-up stream have shown that in each of the two annual rain-seasons the rainfall can be stored in this root range to be transpired during the two dry seasons, so that no surplus is available for stream-flow Kikuyu grass pasture does not, therefore, offer a hydrologically attractive alternative to trees

In addition to food and gainful employment for several hundred Kikuyu families the rotational clear-felling of pine or cypress plantations, followed by clean cultivation of vegetables intercropped between the seedling trees of the next rotation, at present appears to offer the best prospect of increasing water supplies from the mountain catchments of the Aberdares, now under dense bamboo forest

The concentration of rainfall into the tropical wet seasons is so acute that not even the combination of heavy forest and deep porous soils can succeed completely in the even regulation of stream-flow The best catchments under study give ratios of 20 1 for maximum to minimum flow rates When cleared of forests and eroded by overgrazing, some similar East African catchments have given ratios exceeding 3,000 to 1

The work outlined in this paper is progressing as a result of financial support from five East African Ministries and through the personal interest and co-operation of individual technical officers in some fifteen separate departments Together they are making possible the quantitative évaluation of water relationships on which land-use policies for our catchment areas can be soundly based

FRACTIONATION PHENOMENA IN NUCLEAR WEAPONS DEBRIS

By K EDVARSON, KERSTIN LOW and J SISEFSKY
Research Institute of National Defence, 4th Division, Stockholm 80

As is well known, a chemical fractionation of nuclear weapon debris takes place during the particle formation which occurs within the first few minutes after the explosion A discussion of the particle formation phenomena has been given by C E Adams *et al* [1]

In the present article some studies of the distribution of different fission products in air-borne bomb debris are reported and an attempt to interpret the results has been made

The debris was sampled over the middle of Sweden with a filter-device carried by a jet-plane The filter-medium was glass-fibre-paper (an investigation of the filtering efficiency has been published elsewhere[2]) The sampling took place at an altitude of 8–12 km and the air mass filtered was usually 100–250 kgm

A quarter of each sample was measured by γ-spectrometry and a quarter was autoradiographed The γ-spectrometer consisted of sodium iodide (Tl) crystal ($1\frac{1}{4}$ in diam × 1 in) and a 70-channel kicksorter The autoradiographs have been used to give a general picture of the activity distribution on particles and also as an aid for the isolation of individual particles (cf ref 3) The general trend seems to be that in fresh debris (a few weeks old) a relatively great portion of the activity is concentrated on particles larger than 1μ, whereas in older debris the activity is more evenly distributed on smaller particles

By means of the autoradiographs it was possible to locate the more radioactive particles within some tenths of a mm and these particles could be isolated from most of the remaining activity by punching out a small area of the filter containing the particle In this way a number of samples were divided into fractions each containing particles in a given activity range As a rule two particle fractions named K_1 and K_2 and one fraction consisting of the remainder of the filter (R) were taken (cf Table 1) By γ-spectrometry the content in each fraction of the following nuclides was determined (zirconium + niobium)-95, ruthenium-103, iodine-131, lanthanum-140, cerium-141

The results of the measurements for a number of samples are given in Table 1 At the time these studies were started we had not developed a technique for size-determination of the particles Later on, however, it was possible to make a rough correlation between activity, age and particle size (cf ref 4) In Table 1 the particle diameter limits of the fractions are given

The analysis showed that the compositions of the two (three) fractions from the same filter were different, as a rule in such a way that the K-fractions were strongly enriched in (zirconium + niobium)-95 and impoverished in ruthenium-103 while the other nuclides took a middle position Observations of this kind have also been made by May and Schneider[5] and Sittkus[6]

Table 1

Sample	Size of measured sample (kgm air)	Lower limit of fractions		Number of particles per kgm air	(Zr+Nb)-95		Ru-103		I-131		La-140		Ce-141		Date of sampling	Period of autoradiography	Date of measurement
		pc per particle	μ		pc/kgm air	Per cent	pc/kgm air	Per cent	pc/kgm air	Per cent	pc/kgm air	Per cent	pc/kgm air	Per cent

(Values in brackets are uncertain)

These findings might be due to two effects One is that the different fractions originate from different explosions, the other that fractionation phenomena have occurred In the first case the youngest fraction ought to have, for example, higher iodine-131/(zirconium + niobium)-95 and lanthanum-140/(zirconium + niobium)-95 ratios than the older If this were the only explanation of the data, the *K*-fractions should in most cases be the oldest As it is almost invariably found that particles of high activity mainly occur during the first months after an explosion this is a rather incredible explanation It seems more probable that fractionation phenomena are the main reasons for the differences in composition In a few samples (zirconium + niobium)-95 was impoverished in the *K*-fractions In these cases it was found from observations of samples taken a few days before and after that this deviation from the normal must be due to an admixture so that the *R*-fraction contained both old and young activity, whereas the *K*-fraction contained almost exclusively the young activity

In most cases it was possible to establish the origin of the debris from known dates of test-explosions and the lanthanum-140-(zirconium + niobium)-95 ratio in the total sample In these cases the values found have been compared with the theoretically expected in the following way A fractionation factor $f_{A\text{-}95}$ for a given nuclide A is defined in the following way

$$f_{A\text{-}95} = \left(\frac{N_A}{N_{(\text{Zr+Nb})95}}\right)_{\text{exp}} \cdot \left(\frac{N_{(\text{Zr+Nb})95}}{N_A}\right)_{\text{theor.}}$$

where N is the activity of the nuclide in question The first bracket contains the experimental and the second the theoretical values, as obtained from known fission yield values if the age is known The yield values for fast fission of uranium-238 have been used, as all the samples in question contained uranium-237, indicating that they originated from thermonuclear devices with uranium-238 tamper The assumed yield values are given in Table 2

Table 2 Assumed Fission Yields for Fast Fission of Uranium-238 (ref 7)

Mass-chain	Yield (per cent)	Mass-chain	Yield (per cent)
95	5 5	140	5 9
103	6 4	141	5 6
131	3 3		

In Table 3 the fractionation factors for the different mass-chains are given As is evident from Table 3 there exists a definite trend in the fractionation factors In the *K*-fractions the fractionation factors increase in the order ruthenium-103, lanthanum-140, (iodine-131), cerium-141 and (zirconium + niobium)-95 and are quite small for the first nuclides in this sequence

It is possible to explain this trend qualitatively from the chemical properties of the elements in the mass-chains at the time of particle formation

As the debris probably emanated from thermonuclear devices it seems reasonable to assume a yield of the order of magnitude 1 Mt In this case the particle formation probably occurs about 15–20 sec after the explosion In Table 4 the element composition of the mass-chains 17 sec after instantaneous fast fission of uranium-238 are given It has been calculated assuming equal chain-length, using the values of Z_A and fractional yield versus (Z–Z_P) given by Grummit and Milton[8], and the half-lives of the short-lived fission-products given by Bolles and Ballou[9] The value of ν has been assumed to be 2

Table 3 Fractionation Factors

Sample	Mass-chain 103	131	140	141	Assumed date of explosion
117 *K*	0 1	0 2	0 1	0 4	22 8 57

R	1 1			1 1	
167 *K*₁	0 1			0 5	25 2 58
*K*₂	0 1			0 6	
R	1 3			1 4	
168 *K*₁	0 1			0 4	25 2 58
*K*₂	0 2			0 5	
R	1 1			1 2	

(Values in brackets are uncertain)

Of the elements in question, barium, strontium, yttrium, zirconium form oxides stable at high temperatures with the vapour pressures decreasing in this order Cæsium, molybdenum, tin, antimony and tellurium form volatile stable oxides or are volatile in elemental form From these properties it can be expected that the material condensed at an early stage is enriched in mass-chain 95 and impoverished in 103, 131 and 140, whereas 141 is somewhere between If it is assumed that the large particles in average consist of early condensed material the observed fractionation factors are thus qualitatively explained

From Table 3 it is also found that the fractionation in the *R*-fractions seems to be small

If most of the activity is bound to small particles (< 1μ diameter) at the condensation, the fractionation in the *R*-fraction may well be small although it is

Table 4 Calculated Composition of the Mass-chains 17 sec after Fast Fission of Uranium-238

Mass-chain	
95	20 per cent Sr + 70 per cent Y + 10 per cent Zr
103	5 per cent Nb + 65 per cent Mo + 30 per cent Tc
131	2 per cent Sn + 95 per cent Sb + 3 per cent Te
140	40 per cent Xe + 50 per cent Cs + 10 per cent Ba
141	30 per cent Cs + 70 per cent Ba

appreciable in the K-fractions It should be noted that the particle spectrum in a sample collected a long time after the explosion is quite different from the original due to the change in settling rate with particle size Thus the fact that the K-fractions sometimes constitute quite a large part of the samples does not contradict the explanation given above

A NEW SERVICE FOR NATURALISTS

By R S R FITTER

Director, Intelligence Unit, Council for Nature

THE Intelligence Unit of the Council for Nature, which was set up in May 1959, with the aid of a grant of £5,000 a year for three years from the British Broadcasting Corporation, is now ready to deal with requests for information about field natural history in the United Kingdom The Unit has a staff of four and maintains contact with active field naturalists and natural history societies in all parts of the United Kingdom, and is especially interested in their field work Some two hundred of these societies are already members of the Council for Nature, and the Unit hopes, before long, also to extend its intelligence system to those societies which are not members

The Unit will act as a clearing house rather than an information bureau and primary source of information It will aim to pass inquirers on to the best sources of information and works of reference, rather than give direct answers to factual queries, though, of course, these will be given whenever possible The sort of queries the Unit hopes to be asked are of the type "Who are the leading experts on the otter or the peregrine falcon in the British Isles ?" or "Who is an authority on the effects of toxic sprays on bird and insect life ?", or 'Who can say what is likely to be the effect on wild life in the vicinity of a nuclear power station on the coast of Suffolk ?' Questions that can be looked up in a work of reference, such as "How long can an otter live ?" or "What is the breeding season of the peregrine falcon ?", will, it is hoped, not be directed at the Unit in too great numbers, as this will stultify the real aim of the service the Unit seeks to provide The Unit will also not expect to be asked to identify specimens (though it will advise on where such help may be obtained), or to give advice relating to pets, domestic animals or cultivated plants

The broader aims of the Intelligence Unit are to build up a picture of the field work being carried out by naturalists all over Britain, ascertain what gaps there are, and put naturalists working on similar problems in touch with each other Among other services which the Unit provides for the Council is the editing of the Council's half-yearly bulletin, "News for Naturalists", the second issue of which is being published in December This bulletin is not for sale, but is available free to member societies and their individual members

The work of the films officer, Stanley Jeeves, covers the whole field of still and ciné photography by amateurs interested in natural history, but to start with is mainly concentrating on the ciné aspects Recently, a most successful experimental beginners' course of instruction for amateur cinematographers was held at the offices of the Council for Nature, in South Kensington Twenty-three 'students' attended and heard talks on technique and equipment by Stanley Jeeves and on the work of the British Broadcasting Corporation Natural History Unit at Bristol, by Tony Soper Afterwards, they watched films taken by three of their number, on vole damage, by Oliver Hook, on waxwings, by J W Carr, and on terns, by F G Hollands

The experimental course was so successful that the Unit plans to organize another one on similar lines in the north of England, perhaps at Manchester, early in the New Year, and possibly also in Scotland There will probably also be a two-day course, with a slightly more advanced syllabus, in London in the New Year, and this may also be repeated in the north A still more ambitious scheme is planned for next May, when the Unit will hold a week's course for amateur cinematographers at Brantwood, Ruskin's Lake District home, which is now run by the Extra-Mural Department of the University of Manchester as an adult education centre. At this course it will be possible to give instruction actually in the field, and to make and edit one or more short films

Another activity of the Films Section of the Unit is the organization of two competitions for amateur cinematographers interested in wild life The first, for 35 mm (and 16 mm at 24 frames) films, is being organized jointly by the Council for Nature and the British Broadcasting Corporation, which has generously offered two prizes, £500 for a full-length 20–30-min film, and £50 for a 3–8-min sequence This competition is not open to those who have already had more than 10 min of consecutive film shown on television The aim of the competition is to stimulate new talent in the field of natural history cinematography, of which, of course, the British Broadcasting Corporation, and especially its Natural History Unit at Bristol, are big consumers

The second competition is for 8 mm (and 16 mm at 16 frames) film, and is primarily for the many amateurs who cannot yet aspire to a 16 mm camera The prizes are being presented by manufacturers of equipment, the first prize being a Paillard Bolex reflex camera worth about £400 Further information about both competitions and the instructional courses can be obtained from the Films Officer, Council for Nature, 41 Queen's Gate, London, S W 7

A further activity on the films side is the compiling of a comprehensive list of natural history films, and more especially those available for public showing. This is being carried out in collaboration with Mr Michael Gwynne and the Botany Department of the University of Oxford

NEWS and VIEWS

Ministry of Aviation Appointments

Dr C H Johnson, C B E

Brief notes referring to promotions in the Ministry of Aviation were printed in *Nature* of November 7, p 1448 , further information is now available

Dr C H Johnson, who has been promoted to chief scientific officer and appointed director of the Explosives Research and Development Establishment, Waltham Abbey, Essex, in succession to Dr W H Wheeler, on the latter's acceptance of an industrial post, graduated from University College, London, with first-class honours in chemistry in 1925 and a Ph D and the Ramsay Medal in 1927 for work under Prof W E Garner concerned with explosive reactions in gases The next two years were spent on research (the chemical and biological effects of ultrasonic energy) and teaching at the University of California He rejoined Prof Garner at the University of Bristol in 1930, initially as assistant lecturer in physical chemistry In 1937 he was appointed senior lecturer in inorganic chemistry in the University of Birmingham, where he continued his researches, begun at Bristol, on co-ordination compounds, particularly those showing optical activity He was awarded his D Sc (London) in 1940 Commencing some months prior to the outbreak of the Second World War, in association with members of the Department of Chemistry of the University of Birmingham, under the late Sir Norman Haworth, Dr Johnson took part in a survey of volatile compounds of uranium and in attempts to isolate uranium metal in bulk In 1942 he joined Shell Refining and Marketing Co , Ltd , and became manager of the Lubricating Oil Laboratory, then in process of formation at Thornton, Cheshire, and later, also, of the Diesel Fuel Laboratory, built in 1946 These laboratories were afterwards incorporated (with two others) in Shell Co 's Thornton Research Centre Dr Johnson entered Government service in 1948 as superintendent of propellant research at the Explosives Research and Development Establishment and became chief superintendent in 1950 Since 1954 he has been director of materials and explosives research and development at Ministry of Supply headquarters in London

Mr W H. Hill

Mr W H Hill has been promoted to deputy chief scientific officer and appointed to the post of deputy director of air armament in the Ministry of Aviation Since 1954 he has been superintendent of the Weapons Assessment Branch of the Armament Research and Development Establishment, where he has been responsible for important advances, particularly in the application of modern techniques to a field of increasing complexity and importance in armament development Mr Hill obtained his degree at the University of Cambridge Following some four years on the academic staff of the University College of the South West, lecturing in applied mathematics, he spent the period 1941–46 in war service, retiring with the rank of major in the Royal Electrical and Mechanical Engineers, and in 1946 joined the scientific staff of the War Office, serving first with the Army Operational Research Group and later on the staff of the Scientific Adviser to the Army Council He was transferred to the Ministry of Supply in 1952 and spent some eighteen months in the Guided Weapons Department of the Royal Aircraft Establishment before his promotion in 1954

Mr S A Hunwicks, O B E.

Mr S A Hunwicks has been promoted to deputy chief scientific officer and appointed director of Atomic Weapons (Development), Ministry of Aviation He started his career in 1930 in the Department of Engineering at the National Physical Laboratory, where he worked mainly on the strength of materials at high temperatures and lubrication problems In 1934 he graduated in engineering at London In early 1939 he joined the Armament Department of the Royal Aircraft Establishment and gained a wide experience on research, development and design of airborne weapons From 1943 he was responsible for full-scale trials on airborne rockets, including development of techniques for measuring air and underwater ballistics During this period he initiated and carried out the establishment of several Royal Aircraft Establishment ranges, including Lake Alwen in North Wales In 1946 Mr Hunwicks was one of the Ministry of Supply scientific team seconded to the Department of Supply, Australia, for the setting up of the Long Range Weapons Establishment at Salisbury, South Australia, and the Woomera Range His special responsibilities were air facilities, the bomb ballistic range which was the first range operating at Woomera, and staff recruitment On returning to Great Britain, he rejoined the Armament Department, Royal Aircraft Establishment, in 1949, becoming section head responsible for the design and development of special weapons In 1954 he attended the Administrative Staff College, and shortly afterwards was promoted to superintendent in the Armament Department responsible for the co-ordination of all Royal Aircraft Establishment work on free-falling weapons

Mr A N Christmas

Mr A N Christmas has been promoted to deputy chief scientific officer and appointed director of Guided Weapons (Techniques) at the Ministry of Aviation Headquarters Mr Christmas graduated with first-class honours at the University of London in engineering in 1933, and after a period of research in industry joined the government service in 1937 as an assistant engineer in the Radio Branch of the General Post Office Engineering Department In 1946 he was attached to the Ministry of Supply for work at the Royal Aircraft Establishment on control systems for guided weapons In 1947 he transferred to the Ministry of Supply and continued his work on guided weapons at the Royal Aircraft Establishment until 1951 when he was posted to the United States and for three years was a member of the Ministry of Supply staff at the British Joint Services Mission in Washington During this time he was responsible for liaison work covering the whole field of guided weapon research and development in the United States In 1954 he was promoted to senior principal scientific officer and returned to

Great Britain to take up the post of superintendent of the V.T. Fuze branch of the Armament Research and Development Establishment. In his new post Mr. Christmas will be responsible for directing research and development on guided weapons techniques, including guidance and control, propulsion and advanced engineering techniques specially applicable to guided weapons.

British Contribution to High-Altitude Research

IT was decided at a meeting of the International Committee on Space Research in the spring that great scientific value was to be gained from the simultaneous, or nearly simultaneous, firing of many rockets in different parts of the world carrying identical or related experiments. It was hoped that all countries participating in high-altitude research with rockets would launch one or more, the elucidation of atmospheric structure being a particular aim of the experiments. The British contribution has been developed jointly by the British National Committee on Space Research set up by the Royal Society and the Royal Aircraft Establishment of the Ministry of Aviation, and consists of experiments carried by the upper-atmosphere research rocket *Skylark*. This rocket is powered by the Raven solid-propellant motor designed by the Rocket Propulsion Establishment, Westcott. The rocket is launched with the co-operation of the Weapons Research Establishment at Woomera in Australia. The programme was to launch three rockets, and these were all fired in the space of 36 hr. on November 30 and December 1.

The first *Skylark* carried the sodium vapour experiment devised by the Queen's University of Belfast. Sodium vapour, ejected from the rocket at heights greater than about 40 miles, gives a resonance glow when observed under the correct twilight conditions. Optical observations of this glow, made with an interferometer and with ballistic cameras, can give data leading to both atmospheric temperature and wind structure. The second *Skylark* was to measure the atmospheric temperature and horizontal and vertical wind speeds up to heights of 90 miles using a sound-ranging method. This is based on the optical and acoustical observations of explosive grenades, ejected from the rocket at regular intervals. This experiment is the responsibility of a group at the Physics Department, University College, London. In addition, metal foil was ejected from the rocket and observed by radar, enabling an independent estimate of wind speed and direction to be made by a group at the Department of Meteorology, Imperial College of Science and Technology, London. The third *Skylark* carried three experiments: measurement of atmospheric temperature and horizontal and vertical wind-speeds using the grenade sound-ranging method (University College, London); measurement of wind characteristics by using radar observations of metal foil ejected from the rocket (Imperial College, London); and measurement of electron densities in the ionosphere (Department of Electron Physics, University of Birmingham).

New Australian Botanical Laboratory

THE new Australian Commonwealth Scientific and Industrial Research Organization's Cunningham Laboratory, which was recently opened by the Prime Minister of Australia, Mr. Menzies, occupies a three-acre site in the grounds of the University of Queensland at St. Lucia, a suburb of Brisbane. It was completed this year at a cost of £180,000. The Government of Queensland provided the site, contributed £15,000 towards the cost of the building, and built the access roads at a further cost of £10,000. The work of the Cunningham Laboratory is particularly concerned with pasture improvement in four regions known as the Wallum, the Spear Grass Zone, the Brigalow Scrubs, and the Darling Downs. These regions constitute an area of about 70 million acres, which is considerably larger than the State of Victoria. Officers of the Division of Tropical Pastures (the main group housed in the Laboratory) hope to introduce a number of new grasses and legumes into Queensland pastures. Plant collection officers who understand Queensland conditions have already collected promising species from South America, Africa, Hawaii, the United States, India, Ceylon, Mexico, the West Indies and Central America.

Preservation of Cornish Scenery

THE Minister of Housing and Local Government has confirmed an order made by the National Parks Commission under the National Parks and Access to the Countryside Act, 1949, which designates about 360 square miles of Cornwall as an "area of outstanding natural beauty", and not as a national park. The designated areas include some of the finest and best-known coastal scenery in Britain, and Bodmin Moor. A large part of the Land's End peninsula, a coastal strip from St. Michael's Mount to Porthleven, and the whole of the Lizard peninsula, including the beautiful Helford Estuary, to the outskirts of Falmouth are covered by the order, while other parts of south Cornwall included are the territory between St. Mawes and St. Austell, the Fowey Estuary to West Looe, and Rame Head to Mount Edgcumbe, overlooking Plymouth Sound. In north Cornwall, the whole of the coast between the Devon–Cornwall county boundary, at Marsland Mouth, and Bedruthan Steps, north of Newquay, is included, apart from an area around Bude and part of the Camel Estuary between Polzeath and Padstow. The order also covers the coast from Perranport to south of St. Agnes Head, and between Portreath and Godrevy Towans. The responsibility for preserving and enhancing the natural beauty of the landscape rests with the local planning authority, Cornwall County Council. Government grants can be made at the rate of 75 per cent towards the cost of treating derelict land, tree-planting and preservation, and removing disfigurements. Grants are also available towards expenditure incurred in making agreements or orders for public access to open country and in appointing wardens. Designation does not provide any right of access to land not already open to the public; nor does it affect the existing use of land, for example, the use of War Department land for military purposes.

Darwin Centenary

FOR the first time, a number of the *Notes and Records of the Royal Society of London* has been devoted to a single topic (14, No. 1; June 1959). Its main purpose is to celebrate the centenary of the publication of "Origin of Species", and this has been done most adequately. It contains a fascinating collection of unpublished letters of Charles Darwin as well as an article on A. R. Wallace which, *inter alia*, directs attention to his essay of 1855; this hitherto appears to have escaped notice. There are also biographical sketches of the four men who probably had most influence on Darwin—Erasmus Darwin, Lyell, Hooker and Malthus The essay on Malthus by Prof H J Habakkuk is of special interest and shows how, with his writings on population, Malthus provided the clue to the origin of the species both for Darwin and for A R Wallace This special copy of *Notes and Records* was designed to pay tribute to Darwin, and in itself is a tribute both to him and the Society which sponsored it

Education as a Career

THE Ministry of Education has published a pamphlet intended to give university students a picture of the opportunities which exist for men and women to follow a career in education ("A Career in Education for University Graduates" Revised edition Pp 15 London Ministry of Education, 1959) It describes the training and types of work open to university graduates who become schoolmasters and schoolmistresses, with particular reference to work in grant-aided schools It also refers to the financial aid available towards the cost of training The appendixes which follow give up-to-date facts about teachers' salary scales in schools and about teachers' pensions They also include some information about opportunities for teaching in establishments of further education and training colleges, and for work in local educational administration and H M Inspectorate There are also opportunities for educational work in a variety of other spheres, both in Great Britain and abroad, and some of these are described.

Handicapped Children

THE thirteenth in a series of special subject booklists prepared for the Library Association deals with handicapped children in Britain ("Handicapped Children in Britain—Their Problems and Education" Books and Articles published in Great Britain from the 1944 Education Act to 1958 Compiled by Mrs W A Axford Pp 53 London . Library Association, 1959 4*s*) The compiler, Mrs W A Axford, of the University of Birmingham Institute of Education, deserves the warmest praise for a painstaking task well done , the list includes details of books and articles published in Great Britain from the 1944 Education Act to 1958 The bibliography covers all types of physical and mental handicap, but not psychological or social handicaps Articles of a purely medical nature are excluded unless they are of general interest For easy reference the items are arranged in alphabetical sequence of subject headings

Film Strips for Schools

DESPITE the exciting potentialities of moving films and television as means of evoking interests in schoolchildren, the teaching profession as a whole regards the still picture as an even greater aid to teaching The moving picture awakens interest and captures attention , teachers use still pictures to ensure that factual knowledge is retained For this reason, they will once again be grateful to the enterprising firm of Educational Productions, Ltd , for adding four more attractive and inexpensive coloured film-strips to its wide range One, showing a variety of common garden insects, has been prepared by the well-known photographer, George Hyde, and would be of interest to horticultural clubs as well as in school biology classes "Resident British Birds" has been prepared in collaboration with the Royal Society for the Protection of Birds , the photographs are by Eric Hosking and the script by Philip Brown "Grasses" would be of particular use in sixth form and university botany classes, while "Seed Germination" should find a warm welcome in secondary modern, secondary grammar schools and others where biology is taught to the General Certificate of Education, 'Ordinary' level (Educational Productions, Ltd Filmstrip No 5260 Insects in the Garden 28 frames 16*s* 6*d* Filmstrip CX 6290 Seed Germination 23 frames 27*s* 6*d* Filmstrip CX 6332 Grasses 27 frames 27*s* 6*d* Filmstrip CX 6208 Resident British Birds 33 frames 27*s* 6*d* East Ardsley, Wakefield Educational Productions, Ltd , 1959)

Evolution of the Human Brain

THE James Arthur Lecture on the Evolution of the Human Brain, given by Prof D P C Lloyd, entitled "The Discrete and the Diffuse in Nervous Action", has now been issued (pp ii+28 New York Amer Mus Nat Hist , 1959) His central theme is Cajal's concept of "les réflexes unilatéraux circonscrits" and "les réflexes unilatéraux diffus" Much of Prof Lloyd's work has been concerned with the functional implications of the anatomical distinction made by Cajal , and in this lecture he elaborates the idea that the circumscribed monosynaptic reflex is an accurate, rapid and discrete functional arrangement of advanced evolutionary status On the other hand, the diffuse reflexes involving interneurones constitute an organized, although more plastic, system for synergic mass actions The latter are to be distinguished from the primitive mass action systems of many invertebrates by the 'local sign' they exhibit in performance There is little in this theme that is controversial, and much that can now be considered as consolidated in physiological thought but Prof Lloyd, as the author of a substantial part of the experimental evidence, develops the theme with great clarity and point

Fodder Beet, Mangels and Swedes

REVISED leaflets describing varieties of fodder beet and mangel and of swedes have recently been issued by the National Institute of Agricultural Botany at Cambridge In each of these crops the Institute has tested very large numbers of varieties, and these leaflets give details of the important root characters, the size of top and percentage bolters of the varieties which have proved most successful in the trials These leaflets give the farmer the information he needs to make an intelligent choice from the bewildering range available Copies can be obtained by sending a stamped addressed envelope, saying which leaflet is required, to the Secretary, National Institute of Agricultural Botany, Huntingdon Road, Cambridge

Announcements

THE honorary officers and members of Council of the Association of Consulting Scientists for 1959–60 are *Chairman* Dr J G Davis , *Hon Treasurer* Dr G W Ferguson , *Hon Secretary* Mr W H Stevens, Park House, Hawthorne Road, Bromley, Kent , *Members* Dr M Barent, Dr H H Chambers, Dr J Grant, Dr J H Oliver, Mr. O W Roskill and Mr F. G Sarel Whitfield

ERRATUM In the communication entitled "A New Crystalline Salt of Oxytocin" in *Nature* of September 26, p 981, par 3, line 4, for "33 mμ" read "353 mμ"

PROGRESS IN COKE RESEARCH IN GREAT BRITAIN

AN established annual event is the joint meeting of the Coke Oven Managers' Association, the Institution of Gas Engineers and the British Coke Research Association These three institutions cover the technical interest of the carbonizing industries in all its facets This annual gathering has become noteworthy for the fact that some matter of absorbing interest is discussed at the meetings

It will be recalled that in the autumn of 1958 the Duke of Edinburgh opened the new Coke Research Centre of the British Coke Research Association at Chesterfield A special feature of this research station is that it contains, besides chemical and physical laboratories, a large workshop laboratory for pilot-scale plant, an excellent information centre, and a full-scale plant for making coke and its by-products This last feature was a bold venture, which had been in the minds of the practical men of the industry for upwards of a decade

At this year's tripartite meeting, held recently, the director of the Research Association, Mr G W Lee, gave an encouraging account of the work that had been carried out during its first year at the Coke Research Centre Naturally, everyone was interested to hear how the full-scale plant had operated in practice, for the coke-oven manager knows full well the teething troubles that may be expected to be encountered in such an undertaking Mr Lee was able to unfold a story of quite substantial success

The coke oven is to be used for producing sufficient coke to enable performance trials to be made of the resultant cokes in production blast furnaces One cannot use less than a hundred tons of fuel for trial on an industrial unit of such magnitude There is also a by-product plant to deal with the collection of tar and other products distilled from the carbonizing coal in the oven To overcome all the teething troubles successfully in the coldest period of the year when there was 17° F of frost—and incidentally seventeen coke braziers required—was no mean achievement To train also the composite team of operators, having both technical ability and practical experience of plant operation, to run the plant had been a problem in human relations It has to be remembered that the plant was quite unique, and the carbonizing of each charge of coal a huge scientific experiment calling for accurate instrumentation, measurement of numerous values and precise analysis In the upshot, the standard of repeatability of yields achieved was good, and in the final runs reported 'very good', in Mr Lee's modest claims, we should say, in such demanding conditions, excellent

Perhaps the most satisfactory outcome of these trials was to prove that the results of full-scale trials confirmed the usefulness of trials in smaller experimental ovens, a range of which the Association has for long been using Such a situation makes for accelerated progress in the matter of producing still better qualities of coke from coals of diminishing suitability for the purpose, as the reserves of coking coal of good quality become depleted

The Coke Research Association has established, as have other research associations in Britain, a world-wide reputation for the quality of its research In the new Research Station the equipment and the staff are such that the good work can be continued at an accelerated pace 40 per cent of its research effort is devoted to improvement in the quality and yield of coke, and 11 per cent to the thermal behaviour of coal and the fissuring of coke The remainder is concerned with a wide range of fundamental and applied studies that the future welfare of the industry demands

The layman is rightly concerned about the pollution of the air and of the rivers which industrialization carries in its train These subjects have not been overlooked The effluent problem in the coking industry has many features in common with that of the gas industry, and accordingly these industries have joined forces in tackling the water pollution problems that arise from their activities The Coke Research Association is supporting both financially and technically the work of the Joint Research Committee and the University of Leeds through its Ammonia Effluents Sub-committee

As regards the field of atmospheric pollution, investigations of the Coke Research Centre have included preliminary studies of the chemical and physical nature of the smoke emitted from a coke oven Naturally, problems of suppression are also being studied

All these matters that concern the future prosperity of the coal industry contain reassuring features of particular interest to those enlightened sections of the British public which already recognize that the future of coal must depend upon the technological effort put into its utilization

SOIL SALINITY COURSE IN TUNISIA

FOLLOWING an invitation of the Government of the Republic of Tunisia and with its sponsorship, Unesco's Middle East Science Co-operation Office organized a Regional Training Course on Diagnosis, Improvement and Management of Salt-affected Soils as a part of the Arid Zone Project The course was held in Tunis during September 7–October 3, 1959 It consisted of one week of lectures, followed by two weeks of laboratory work and a field trip to the arid regions and saline soils in Tunisia

The chemical aspects were treated by Dr A D Ayers, formerly with the U S Salinity Laboratory, Riverside, California, now with the Agricultural Research Service U S Department of Agriculture, Rome, the geological and pedological aspects by Prof G Aubert, Institute of Tropical Soil Investigations, Office for Technical and Scientific Research for France Oversea, Bondy, France , and the physical aspects by Prof W R van Wijk, Agricultural University of Wageningen, Netherlands Dr Ayers served as general technical director

Reclamation of saline soils and use of saline water for irrigation are problems of primary importance in Tunisia This was stressed by the President of the Republic of Tunisia, Habib Bourguiba, who opened the conference and welcomed the group Prof Kovda, director of the Unesco Department of Natural Sciences and one of the foremost Russian soil scientists, thanked the president on behalf of Unesco Prof Kovda stayed at Tunis during the first week of the course He and several French scientists, consultants to the Tunisian Government, gave lectures on special subjects as capillary rise of saline ground water, genesis of saline soils, Tunisian soils, plant associations in Tunisia, crop research in Tunisia, distribution and quality of surface and underground waters in Tunisia The Secretary of State for Education, Mahmoud Messadi, the Secretary of State for Agriculture, Abdessalam Kenani, and many other Tunisian authorities attended at one or more lectures

The lectures and laboratory work were held in the Ecole Supérieure d'Agriculture (director Prof Haffani), where also the participants were housed There were thirty-two participants from ten Middle East countries Of these, fifteen were from Tunisia, the others from Iran, Iraq, Jordan, Lebanon, Lybia, Morocco, Sudan, Turkey and the United Arab Republic Most of the participants were graduate staff members of universities or research institutes and several held responsible positions in their countries The enthusiasm and interest of the participants contributed much to the success of the course

The field trip was offered by the Tunisian Ministry of Education Leaders were Prof G Aubert and Mr Roederer, head of the Pedological Service of the Ministry of Education First the Medjerda valley was visited where an ambitious and magnificent project of reclamation, land amelioration and irrigation is in progress Thereafter the arid and desert areas in the south were visited where a variety of soils of different degrees of salinity were studied The capriciousness of the weather and the statistical meaning of the concept of climate were convincingly demonstrated on that occasion A heavy thunderstorm caused a delay of several hours before the 'Landrovers' could cross the flooded parts of the route Kairouan–Gafsa (annual precipitation between 4 in and 8 in) and the main road Gafsa–Tozeur was badly damaged From Tozeur the field trip went to Kebili and Gabes, crossing the famous salt marsh of Chott el Djerid The plans were to visit the fast saline area around Gabes Again, however, a heavy thunderstorm interfered The expedition was practically isolated for two days in Gabes as the environments were flooded, and then had to return to Tunis

This note on the Salinity Course would be incomplete if no mention were made of the hospitality which the participants and in particular the Unesco instructors received from officials and private persons, Tunisian as well as French On such visits the impressive achievements but also the still remaining problems of the young Republic in the fields of education, public health, organization and employment of labour were frankly discussed

W R van Wijk

THE NATIONAL CHEMICAL LABORATORY

THE Report of the National Chemical Laboratory for 1958 follows the same general lines as previous reports (Department of Scientific and Industrial Research Report of the National Chemical Laboratory, 1958 Pp iv+97 London H M Stationery Office, 1959 5*s* 6*d* net) After a preliminary statement that the name of the Laboratory has been changed to indicate more precisely its true functions and that a steering committee is now responsible for the research programme, the Report sets out the various lines of work on which the Laboratory has been engaged Broadly speaking, these fall into six main groups the extraction of metals, the preparation of pure elements and compounds and the determination of their properties, the corrosion of metals, the development of new materials, analytical research and services, and microbiology Some at least of these divisions have been represented by work in the Laboratory over a period of years, that on the corrosion of metals being a special case in point Each year, however, new problems have come forward and as a result it appears that the staff of the Laboratory is now much larger than it was formerly

In addition to its own work the Laboratory has for some years maintained an advisory service Each year numerous inquiries are received for advice and assistance on all topics related to its own work, particularly such as concern the corrosion of metals and the purification of organic compounds In addition, the Laboratory is often approached for advice on topics quite outside the scope of its researches One example mentioned in the field of corrosion is that of the pitting of domestic copper piping in a housing scheme, and others show that this advisory service must be a valuable feature of the general activity of the Laboratory and that the problems coming in through it may sometimes prove very suggestive and important in relation to its own work

The parts of the Report dealing with corrosion show that some fundamental work on the mechanism of corrosion is proceeding alongside investigations on various aspects of more directly practical interest, such as those on inhibitors Work on the extraction of metals included studies of the extraction and recovery of uranium from a variety of ores, which is of interest to the United Kingdom Atomic Energy Authority, and on the separation of the rare earths Of special interest is the section of the Report dealing with the preparation and properties of pure elements and compounds In the case of metals it has long been known that the presence of even minute traces of impurities, sometimes so small as to prove extremely difficult to detect by ordinary analytical procedures, can lead to profound changes in properties such as hardness and chemical activity The increasing importance of pure metals in modern metallurgical technology makes this part of the work of the

Laboratory of great interest The zone-refining technique has necessarily played an important part

The section of the Report dealing with the development of new materials is largely concerned with ion-exchange resins and the permeability of membranes This part is written up in rather greater detail than the rest of the Report and hence makes interesting reading The underlying ideas are more carefully presented, and there are good graphs of the results As a general criticism it might be said that a good deal of the rest of the Report is presented so briefly that it cannot arouse much interest except among specialists, but the part on new materials does seem to have achieved something in this direction It would be unfair to contrast with this the eleven-page catalogue of strains of bacteria at the end, but the different parts of the Report vary quite considerably in appeal to the non-specialist scientific reader, and perhaps in future greater attention could be given to this aspect It has obviously been a difficult problem for the director and his staff to compress their material into pre-ordained limits, but a tendency to produce information as from one specialist to another has cramped the style in some cases

The general work in the Laboratory now includes emission and infra-red spectroscopy, micro-analysis and polarography The first two might seem to encroach to some extent on the field of the National Physical Laboratory, but the researches are evidently directed towards chemical problems Some work on various compounds of boron is of interest although it seems to have been limited to organic compounds The immediate aim, it is said, has been to provide background knowledge of the chemistry of the boron–nitrogen system and to prepare a range of intermediates from which thermally stable and other useful materials may be made The general impression conveyed by the Report is that inorganic chemistry, which has now become of extreme importance, has perhaps received less attention than it should do, and the metals have, perhaps understandingly, monopolized a large share of the interest in the field

The Report as a whole is a record of work of great value, but with the extension of staff and work the question must arise whether it is now possible to cover the results in an interesting and understandable way in less than a hundred pages It is true that much of the work will ultimately be published in a more extended form, but it will then tend to be lost in the enormous field of specialist literature It might be worth considering whether the Report could be enlarged to double its present size (and, of course, at greater cost to the purchaser) and an attempt made at the same time to deal with topics of wider interest in a way which would attract the general scientific reader J R PARTINGTON

MUTATION OF BACTERIA AT HIGH LEVELS OF SURVIVAL BY ETHYL METHANE SULPHONATE

By ANTHONY LOVELESS
Chester Beatty Research Institute, London, S W 3

AND

SHEILA HOWARTH
Guinness-Lister Research Unit, Lister Institute of Preventive Medicine, London, S W 1

ETHYLATION was first described as a mutation-inducing process ("alkylation of the gene molecule") by Rapoport[1], who used diethyl sulphate as the reagent and *Drosophila melanogaster* as the test material Subsequent work has revealed that ethylating agents appear to have unique properties as mutagens in a number of systems Thus, treatment of phage *T*2 *in vitro* by either diethyl sulphate or ethyl methane sulphonate results in a considerably increased yield of both plaque-type and host-range mutants in the first cycle of infection by the treated phage of untreated cells of *Escherichia coli* strain *B* (ref 2) and strain *B*/*r* (Loveless, unpublished) No other alkylating agents have so far been reported as sharing this property Heslot *et al* [3] have reported that the yield of mutants afforded by barley seeds treated with ethyl methane sulphonate much exceeds that of seeds treated with a wide variety of other alkylating agents , diethyl sulphate, also, was found to have unusual properties[4] Kølmark[5] found that diethyl sulphate provoked an appreciable number of reversions at an inositol locus of *Neurospora* which had proved relatively intractable to other reagents There is no evidence from the results of the Fahmys[6] of any dramatic mutagenic effect of ethyl methane sulphonate in *Drosophila* in comparison with its homologues, but it is probable that this compound was not tested at the high doses which its low toxicity, as measured in other organisms, might be expected to permit D M Green (personal communication) has reported confirmation of the results with *T*2 phage and an extension of the finding to *T*4

There was thus reason for supposing that the unusual genetic effects of ethylation were widespread in the organic world, and we were accordingly prompted to investigate the mutagenic effect of ethyl methane sulphonate upon bacteria We wish now to report the production, consequent upon treatment with this compound, of high yields of revertants of a cystine-requiring mutant of *Salmonella typhimurium* strain *LT*2 and of mutations to phage *T*6-resistance in *Escherichia coli* strain *B* and *B*/*r* In addition, preliminary experiments yielded five auxotrophic mutants of *S typhimurium* strain *LT*2 out of 1,090 colonies tested, each having a different nutritional requirement

(1) *S typhimurium* strain *LT*2, *cysA*-21 [7] (requiring cystine) was grown in synthetic (*M*-9) medium plus cystine at 40 µgm /ml from a 1 100 inoculum from an overnight culture in the same medium At approximately 2 × 10^8 cells/ml the culture was spun, washed in *M*-9 medium lacking cystine and resuspended at *c* 10^{10}/ml in a small volume (*c* 3 ml) of 0 4 *M* ethyl methane sulphonate for 15 min treatment at 37° C (Survival tests carried out independently showed that this treatment left about 70 per cent viable cells , in the mutation experiments the actual recovery was only 10–20 per cent owing,

at least in part, to losses in centrifugation Since the treatment was given by re-suspending a centrifugal pellet with residual buffer, the final concentration of ethyl methane sulphonate was probably nearer 0 35 *M* Care must be exercised in the use of ethyl methane sulphonate and some other alkylating agents[8] at concentrations nearing saturation since toxic effects other than those due to alkylation may become pronounced (Ethyl methane sulphonate is saturated at about 0 5 *M*) At the end of the treatment the suspensions were diluted tenfold into phosphate buffer to minimize further action, re-spun and re-washed to remove ethyl methane sulphonate, and plated on minimal medium enriched with 0 01 per cent dehydrated 'Difco' broth (*c* 1 5 × 10^8 or 1 5 × 10^7 cells per plate), and at appropriate dilutions on minimal-plus-cystine medium and on broth agar Control plates were made similarly from the re-suspended cells before the last centrifugation prior to treatment

Revertant colonies, that is, colonies non-exacting for cystine, were of two main types large colonies assumed to be due to back-mutation, and small colonies attributable to partial reversion, phage grown on the latter was able to transduce the mutant strain *cysA*-21 and other mutants of the same group to a 'small-colony' form By analogy with similar revertants of this strain previously analysed[9], they may be interpreted as being due to suppressor mutation The results are given in Table 1

Table 1

	Total viable cells plated	Large-colony revertants	Small-colony revertants
Untreated	5×10^8	5	18
Treated	10^9	1,094	47,110

The counts were made after four days incubation The total viable cell value is based upon colony counts on minimal-plus-cystine plates, since these were higher than upon broth agar

(2) *S typhimurium* strain *LT*2 (wild type) was handled as above except that it was grown in minimal medium without cystine and plated ultimately on nutrient (broth) agar Replica plating on to minimal medium revealed 5 auxotrophic colonies out of 1,090 printed These were checked by re-streaking on both media and by testing for sensitivity to phage *PLT* 22 strain *H*5 All five were transducible to prototrophy by phage *PLT* 22 grown on wild-type cells Four of these have been identified as requiring histidine, adenine, cystine and glutamic acid respectively The fifth is not yet identified

(3) *E coli* strain *B* or *B/r* was grown in broth from an overnight culture to *c* 5 × 10^8 cells/ml and concentrated to 2 × 10^9/ml for treatment in *M*-9 buffer (It is necessary to use phosphate buffer since the reagent hydrolyses, albeit slowly, to give methane sulphonic acid, which is not adequately buffered by broth) Strain *B* was treated with a 0 1 *M* solution for times ranging from 8 min (100 per cent survival) to 15 min (20 per cent survival) and strain *B/r* with a 0 2 *M* solution for 10 min (70 per cent survival) Treated cells were diluted tenfold, washed, re-suspended in broth at *c* 10^8 viable cells/ml and aerated at 37° C Samples were withdrawn immediately and after various times of aeration for determination of total viable count and for assay of *T*6-resistant mutants (*B*/6) For the latter purpose, samples were mixed with phage *T*6, affording a multiplicity of between 10 and 50 for 5 min and then spread on plates each pre-spread with 10^9 phage particles, and incubated overnight at 37° C After each 2-hr aeration, the cultures were diluted 1 20 to preserve logarithmic growth The genuineness of the putative *B*/6 colonies was confirmed in a representative number of cases by replica-plating on to agar spread with 10^{10} *T*6 particles/plate The results are given in Table 2

The experiments with strain *B* were repeated a number of times, varying the conditions, including the subdivision of the control and treated cells into a number of parallel cultures, but in all cases the result was similar At 100 per cent survival the result was less dramatic but the yield of mutants always rose to between 5 and 20 times the control

Demerec[10] distrusted the procedure of growing the cells in fluid medium after treatment, on the ground that it did not permit discrimination between the progeny of early or pre-existent mutants and newly emerging mutants Our controls indicate that there is no difference between the time of generation of wild-type and mutant, nor selection effect of a sufficient order to invalidate the procedure adopted here

The main purpose of this article is to direct attention to the unusual properties of ethylating agents as mutagens Their apparent uniqueness could be attributed to their extremely low toxicity which permits the use of much higher doses (from the point of view of the amount of chemical reaction sustained) than is the case with other alkylating agents From this point of view the genetical observations present a problem to the chemist and biochemist Our

more exclusively chemically-minded colleagues have tended to regard alkylating agents in the capacity of anti-mitotic substances as mere destroyers of deoxyribonucleic acid and have, indeed, adduced much evidence of this potentiality. In their capacity as mutagens, however, assuming, as we know to be the case with phage, that this is mediated by reaction with deoxyribonucleic acid, extensive degradation of the genetic material can play no part unless one assumes that the ultimate mutagen is a breakdown product of deoxyribonucleic acid. This is unlikely since we know, for example, in the case of bromouracil[11] that incorporation of unnatural components into deoxyribonucleic acid is itself only a pre-mutational step. The possession of a mutagen which is active at high survival-levels provides an opportunity of identifying the reactions constituting the premutational step unobscured by lethal side-effects. In the case of bacteria we would like to establish whether in fact the ultimate mutation arises as a consequence of a primary reaction with deoxyribonucleic acid, leading perhaps to faulty replication at the actual site of reaction, and are considering the use of bacterial conjugation or transduction for this purpose.

From a different point of view, we feel that ethylating agents may raise chemical mutagenesis from the level of a laboratory trick to that of considerable practical importance, for example, in the field of plant breeding and industrial microbiology, and can fully agree with the words of Heslot *et al.*[3] " . . . nous considérons que ce corps peut avoir une utilisation pratique immédiate pour l'induction expérimentale de mutations chez les plantes cultivées". A method of preparation of ethyl methane sulphonate has been described by Ross[12].

In respect of one of us (A. L.), this investigation has been supported by grants to the Chester Beatty Research Institute (Institute of Cancer Research: Royal Cancer Hospital) from the British Empire Cancer Campaign, the Jane Coffin Childs Memorial Fund for Medical Research, the Anna Fuller Fund, and the National Cancer Institute of the National Institutes of Health, U.S. Public Health Service.

Note added in proof. The sharp increase in toxicity of the ethyl methane sulphonate at concentrations nearing saturation reported above has now been shown to have been due to an impurity. We are unable to state the nature of this impurity, or whether it was present in the freshly prepared ester or developed on standing. It is certain, however, that the contaminant was neither an alkylating agent nor a mutagen in the systems studied. The yields of mutants given above are, therefore, valid but do not represent the maximum obtainable at the survivals indicated.

Using a more highly purified specimen it was possible to treat B/r with a 0.3 M solution for 30 min., namely 4.5 × the dose employed previously, while retaining virtually 100 per cent viability. The yield of $B/r/6$ colonies obtained after such a treatment rose to $10{,}740/10^7$ cells plated after 15 divisions of the treated cells; controls behaved as previously.

FOSSIL POLLEN FROM SEYMOUR ISLAND, ANTARCTICA

By LUCY M. CRANWELL*

Auckland Institute and Museum, Auckland, New Zealand

DUSÉN[1], Gothan[2] and Halle[3], who worked on plant fossils collected by the Swedish Antarctic Expedition of 1901–3, make no mention of microfossils in the material. Halle[3] explained that the mode of deposition of the plant layers in the dark, slaty Jurassic beds of Hope Bay, near the northern tip of Graham Land, precluded study of the sporangia on the fronds of a species of *Todites*, for example. Dusén[1] and Gothan[2] do not seem to have looked beyond their poorly preserved leaf and wood fragments, respectively, when dealing with the younger deposits of Seymour Island and its environs. It is from this area that I have now found pollen grains and spores—the most durable and most conservative of plant organs, as well as the most eloquent indicators of past vegetation and possible climates.

The following notes on the microflora of a small rock sample from Seymour Island are thus, so far as I can discover, among the first published records of fossil microspores from the Antarctic. Sir Albert Seward provided the first with the type of *Pityosporites*; the second has just come to hand as a list in the September report of the Australian National Antarctic Research Expeditions. These important contributions are discussed more fully at the end of this article.

Bunt[4], in his preliminary report on Macquarie Island lignites, deplores the fact that so little use has been made of pollen in studying these southern deposits. I agree with Dr. Bunt, but I do not think, as he does, that the microfossil approach has been ignored; rather, I would suggest that some of the matrices have proved recalcitrant. Where I once failed to find recognizable remains in a Kerguelen sample, Cookson[5] isolated evidence of a flora particularly rich in conifers from 'coaly' and other materials from this subantarctic island. Again, although I have just had some success with Seymour Island material, I failed in 1939 to recover either pollen grains or spores from the same rock sample

---

* Present address: Geochronology Laboratories, University of Arizona, Tucson.

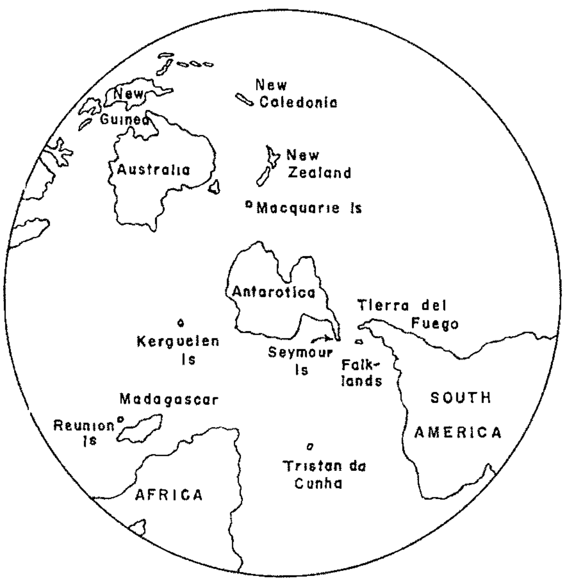

Fig 1 Map showing position of Seymour Island in relation to Palmer Peninsula, formerly known as Graham Land

In view of the considerable age of the parent deposits, on which Dusén[1] and Halle[3] did not agree, and because of the dearth of information about antarctic and subantarctic plant fossils in general, it seems worth while to present a brief account of the most striking components so far noted A fuller report will follow after further study and an exchange of opinions with others interested in plant distribution in these regions

On Seymour Island (Fig 1) sandstones lie at the surface, or are partly covered by huge angular blocks of basalt, whereas on nearby Ross Island and on the mainland they are hidden by the volcanics Dusén[1] writes of coarse-grained tuff and calcareous sandstone, of some fine-grained material, and of the extreme rarity of richly calcareous material In deciding that these fossiliferous layers are not of early Tertiary age he seems to have been most influenced by the likeness of his fossil leaves to their living counterparts, as also to magellanic fossils he had already dated as Upper Oligocene or Lower Miocene In addition he believed strongly that a subtropical element occurred in the lowlands of Antarctica and that this antedated the spread of the Fagaceae northwards to form the so-called Fagus Stage in South America For fifty years the Seymour Islands beds have thus been referred to as Eocene or Oligocene Harrington[6] does not mention the area in his summary of recommended names for antarctic rock units, as his committee dealt only with East Antarctica, but he has informed me, after reading part of my manuscript, that recent work by British geologists with the Falklands Islands Dependencies Survey has shown conclusively that there is an angular unconformity on Seymour Island the beds in the south-west are Cretaceous (Lower to Middle Campanian) while those in the north-east are probably Lower Miocene This clears up the long-standing confusion and makes it clear that no early Tertiary deposits have been discovered

My sample was collected by the Swedish Expedition and it is numbered 260/39 in the collections of Auckland Museum Before sampling it looked most unpromising, being a very small, pale grey, fine-grained and weakly laminated fragment, quite unlike most of the material handled by Dusén Only the faintest flecks of carbonized remains showed before the lamina were separated to reveal a few larger but excessively macerated leaf traces As the matrix called for further examination, I submitted it to Prof John W Anthony, University of Arizona Geology Department, who describes it as "essentially a tufaceous limestone" (personal communication) A thin section showed the following minerals after leaching calcite, quartz, plagioclase and orthoclase feldspars, and amphibole (probably hornblende), and a fairly large percentage of curved glass shards Of this association of minerals Prof Anthony adds "Apparently this glass was ejected from a volcanic vent at the time the limestone was forming and it settled through water to become incorporated into the unconsolidated limestone The other mineral fragments, together with a few of what appear to be igneous rock fragments, settled in the same way" An extremely small faunal component was noted in this section

The attrital component, treated with a modified Schulze's solution, comprises pollen grains, pteridophyte spores, fungal teleutospores, mere traces of algae and fragments of cuticle Preservation is sometimes excellent, but most of the pollen grains are broken or eroded, and wood and cuticles are macerated almost beyond recognition, although occasional hairs persist Some of the larger and seemingly more fragile grains, 50μ and more in diameter, are also the best preserved This contrast suggests a history of abrasive water-carriage, on one hand, and gentler sifting down through the air of wind-blown types to the rendezvous in coastal sediments

As these notes will show, there is sufficient mixture of familiar floristic types to suggest derivation from varied communities, probably mainly from forest at different elevations The high percentage of unfamiliar pollen grains in particular suggests that some types may have been washed in from older deposits

The dominants, as indicated by the pollen, are conifers and southern beeches (species of *Nothofagus*) a similar assemblage occurs to-day all around the southern hemisphere (with the exception of the African–Madagascar region) and in montane New Guinea and New Caledonia, as Dr van Steenis's reports[7] on the results of the Archbold Expedition recently showed In New Zealand it has been traced as far back as the Cretaceous[8–10]

GYMNOSPERMS mainly podocarps and araucarians *Araucaria* grains are mainly smaller than those described by Cookson[5] from Kerguelen deposits *Agathis* and other furrowless coniferous types appear to be present, in a crumpled condition Bisaccate and trisaccate grains are fairly common, ranging through the *Podocarpus – Acmopyle – Dacrydium – Phyllocladus* complex[8,11], together with allied but distinctive forms foreign to those of the living species The phyllocladoid component is varied, the grains often being less than half the size of known living and fossil types[5,8,10] In Fig 2(4) is shown a *Phyllocladus*-like grain (to be described elsewhere) about 17μ in length, which has the 'spunky' bladders reminiscent of some living dacrydia No tuberculate grains were seen Most larger grains tie in with *Podocarpus*, *Acmopyle* and the *Dacrydia* seemingly most nearly allied to *Podocarpus*[8] [Fig 2(2,3)] the smaller grains seem to suggest some meeting ground between *Phyllocladus* and the second pollen group in *Dacrydium* (typified by *D cupressinum*, *D bidwillii*, etc), both of which have radially strengthened bladders Where grains are small, smooth, furrowed

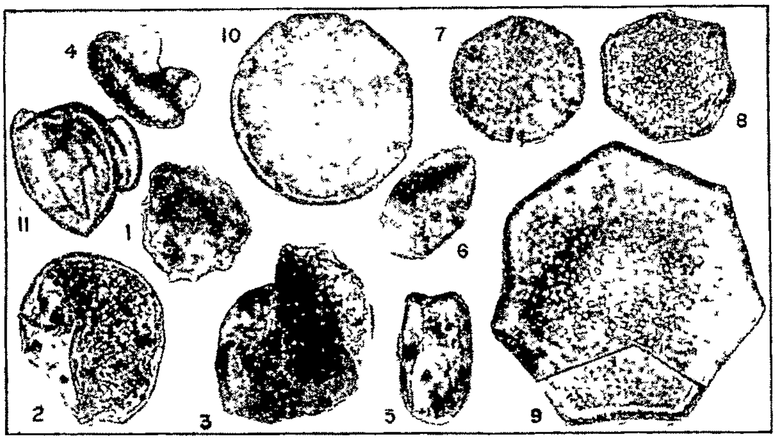

Fig 2 Microspores fossil from Seymour Island (1–7), living types (8–11) (*A*) *Cyathea*-like fern spore, 25μ (1) (*B*) Pollen grains (*a*) coniferous of *Podocarpus*-type (folded, showing one bladder, 2, 3), *Phyllocladus*, 17μ, focused on lower bladder (4), *P alpinus*, 28μ New Zealand, (11), (*b*) palmoid, 25μ (5), (*c*) dicotylous (6–10), *Nothofagus* pollen grains of *fusca* group, 24μ, folded in half (6), living *fusca*, 37μ, New Zealand, *N whenua* n sp, 18 5μ (7), *N bernhardi*, 23μ of *brassi* group, New Guinea (8), of *N menziesii*, 55μ, New Zealand (9), with inset showing fissurable points on equator (× 660–840)

and variously folded along the furrows, it is impossible at this stage to tell whether they belong to gymnospermous or palmoid types [cf Fig 2(5)]

ANGIOSPERMS All the fagaceous pollen recognized falls into the first two of the three known *Nothofagus* pollen groups, as exemplified by the following living species[10,12,14] (1) *fusca*, grain rounded in outline, exine firm, scabrate, pore rims strongly thickened, pore membranes sunken, (2) *brassi*, seemingly an intermediate type grains usually strongly angled, often embayed between angles, rim-thickening and pore membranes reduced or lost, and (3) *menziesii*, which has larger, thinner-walled, sharply scabrate (spinulose) grains, and only vestiges of pores, their function being taken over by wide furrow-like areas (as in most species of *Quercus*) which rupture characteristically under pressure All members of these pollen groups are anemophilous forest-formers to-day, and some form low scrub under adverse conditions The *fusca* group is important in southern South America, Tasmania and New Zealand, in New Zealand, at least, hybridism between its members is rife[15] Pollen of the *brassi* type was first isolated from Miocene deposits in New Zealand[12] living species in New Guinea and New Caledonia are now known to produce pollen of this type exclusively[14]

The *menziesii* group is found to-day in cool forests of South America, and in Australia, Tasmania and New Zealand Its fragile pollen grains occur in low frequencies in peats, etc I have not found any in the Seymour Island material, although Dusén[1] compared fossil leaves with those of *N obliqua*, a South American member of this group It is to be expected that some trace of its pollen will be found somewhere between these western and eastern limits, possibly in even older deposits than those of Seymour Island In New Zealand, Couper[10] has recorded pollen closely allied to that of *N menziesii* as far back as the Upper Cretaceous, and he considers that his *cranwellae* type (*brassi* group of Cookson and Pike[14]) goes back to the Lower Cretaceous This type has its oldest Australian record in the Tertiary

All the antarctic beech pollen is small, ranging from about 14μ to 24μ This puts it at the lowest range of *brassi*-group pollen[14] Some grains approach the *brassi* type, but all that I have seen lack embayment of the intercolpar areas

One very small and distinctive type, which I am naming *N whenua*[15], may be compared with *N bernhardi* of New Guinea, as figured by Cookson and Pike[14] However, it has features that lead me to surmise that the *menziesii* group, despite its large size, could be a lineal descendant of this or an earlier small, sturdy, star-like grain

Both the gymnosperms and the angiosperms of Seymour Island, therefore, suggest antiquity through their pollen record

Various families are represented in lower frequencies, for example, Cruciferae, Myrtaceae, Proteaceae (aff *Lomatia*, as figured by Auer *et al*[16]), Loranthaceae (aff *Loranthus micranthus*), Oenotheraceae (badly eroded *Fuchsia*-like grains, comparable with those of *F magellanica*), and perhaps Winteraceae of unrecorded type Various very small grains (9–20μ) are fairly common, they may belong to the Cunoniaceae (cf *Weinmannia*) or the Elaeocarpaceae Even with sub-fossil material of this nondescript type identifications are not easy

PTERIDOPHYTES Spores occur sparingly and are usually well preserved The Cyatheaceae is represented by weakly trilete verrucose spores, and the Schizaeaceae by a very rare and small spore with striations reminiscent of the massive *Schizaea laevigata* spore described by Selling[17] from New Caledonia Halle[3] reported both families from his Jurassic material

The perfect condition of some of the very small pollen grains is of interest it may be that abrasion is most severe when grains are greater than 10–15μ in size

No spores of lycopods or pollen grains of Compositae, Centrolepidaceae, Restionaceae Pandanaceae, Gramineae or Cyperaceae have been recognized These absences seem significant Among the unidentified types were tetrads and spiny grains, a few heavily reticulate grains, and a palmoid group already mentioned It should be noted that the total number of microspores or fragments, per slide, is exceedingly low

DATING Redeposition of microspores from older beds has been noted as a possibility This older component may well be Cretaceous a Senonian (for example, Campanian) date does not seem excessive to me For the younger component an upper Tertiary limit cannot as yet be hazarded it contains types represented in early Tertiary deposits elsewhere in the southern hemisphere and seems to lack others, such as grasses, sedges and composites, which are usually present by the Miocene

These records enrich the antarctic lists derived from megafossils They give no evidence of the presence of *Fagus* (as reported by Dusén[1]) but emphasize instead the importance of *Nothofagus* in the antarctic background As pollen evidence accumulates in the southern hemisphere so shrinks the *Fagus* empire postulated in the writings of von Ettingshausen, and is replaced by a condominium of southern beeches and conifers, which are still, in very similar form, compatible in cool areas to-day

PITYOSPORITES ANTARCTICUS I referred earlier to Seward's controversial note of 1914[18], in which he described a small plant body as a two-winged pollen-grain This object was lodged in a partially decayed stem of *Rhexoxylon priestleyi* found by Sir Raymond Priestley in a boulder of Beacon Sandstone on the medial moraine of the Priestley Glacier, behind Terra Nova Bay, in Victoria Land

Seward's interpretation of this inclusion met with such opposition, except, perhaps, from Dr H Hamshaw Thomas and Dr and Mrs Harry Godwin, that by 1933 [19] he was writing wistfully of "my unfortunate pollen grain", and pleading for his "fancy" that "Fancy with fact is just one fact the more" The opposing camp held to its view that he was probably dealing with a crushed pith cell

Seward had instituted the genus *Pityosporites* to receive the new material (of which two examples were found), thinking that it could include other pollen grains of similar size belonging to "*Pinus* and other Abietineae" He soon decided, however, that he had over-stressed likeness to this northern group · on geographical grounds such pollen grains were more likely to have been produced by some member of the predominantly southern Podocarpaceae Florin[20] accepted this reasoning as he writes of the grains as "possibly podocarpaceous" in his valuable paper on conifers of Chile and other southern lands Seward, however, had pointed out that other groups known to have occurred in Antarctica could have produced these two-winged grains The question of their identity, as of the age of the boulder, was thus left open

If we grant, as I am happy to do, that Seward really discovered pollen grains, it is interesting to dwell further on the characteristics supplied by, or suggested by, his description and illustrations In size (80μ) the objects are comparable with pollen grains of some living species of *Pinus* and *Podocarpus,* but come closer to the latter in the outline of the thick-walled cap, the strongly rhomboidal body, and the rather large distinctively reticulate wings, which show up best in the 1914 photomicrograph If the sandstone in which the stem was embedded proves to be beyond the time-range of known members of the Podocarpaceae, other possibilities must be considered, and Seward has already mentioned *Glossopteris* and the Caytoniales Concerning the former, Balme and Hennelly[21] hold that there is still inadequate proof of the discovery of microspores Those of the Caytoniales differ from the antarctic type in their strikingly smaller size (less than 36μ, as a rule, including the wings), rounder, smaller bodies, narrower furrows, and a tendency, at least in some shown me by Dr Jane Gray, to develop radial ("dacrydioid") wing thickenings In addition, the body is little overlapped, if at all, by the wings On the other hand, the antarctic grain is matched for size by microspores of *Pteruchus,* produced by pteridosperms (seed-ferns) and first described by Thomas[22] (see also Couper[23] Pl 26, Fig 9) from possible Middle Triassic beds in Natal, and, among other localities, from Australia as well in the southern hemisphere by Balme and Hennelly[21] In some examples the body is seen to be partly hidden by the wings Illustrations have been presented in distal view, the wings appearing flat this appearance is also characteristic of certain living species of *Dacrydium* and *Podocarpus,* the apparently flaccid wings of which are nevertheless seen to be more or less turgid if a lateral view can be obtained Thus, after acknowledging very strong similarities to podocarpaceous grains, we come full cycle to consider whether the bodies in the pteridosperm stem (*Rhexoxylon*) may not have been pteridosperm pollen grains

PERMIAN RECORDS Thanks to the co-operation of Dr H J Harrington (personal communication October 19) I am able to summarize the results of very recent microspore studies of carbonaceous shale and coal from the Amery Formation, which Crohn[24] states is "regarded as the equivalent of the lithologically and structurally similar beds of the Beacon Formation" Dr Crohn reports thirteen types and is able to assign a Permian age to these deposits · his identifications were supplied by Permian specialists at the Coal Research Section, Commonwealth Scientific and Industrial Research Organization, Sydney Trilete spores amounted to 9 per cent, while 11 per cent were monocolpate and unwinged, and 80 per cent bisaccate, or with an encircling wing, as in the two forms of *Florinites* Bisaccate types included high frequencies of *Lueckisporites* (distinguished by striations on the proximal (cap) side of the grain) but only 2 per cent of *Pityosporites* sp Fuller reports will be awaited with great interest Strong Australian and Indian affinities can be assumed from comparison with other work on Gondwanaland forms by Dr C Virkki in India, and by Balme and Hennelly in the Australian region

I wish to thank Prof Terah L Smiley and Dr Jane Gray of the Geochronology Laboratories, Prof John W Anthony of the Geology Department, and Mr Dick Shutler, jun , all of the University of Arizona, for help of various kinds Mr Shutler gave me much laboratory assistance, including the running of this sample, during the past year I have received pollen samples from Dr George Taylor and Dr R A Howard, directors of the Royal Botanic Gardens, Kew, and of the Arnold Arboretum, respectively, and I am indebted to Dr Gilbert Archey, director of the Auckland Institute and Museum, for unfailing support of my work

In addition I wish to thank Dr Harrington of the Geology Department, University of New England. N S W , for his summaries of recently published British and Australian work, to which I could not otherwise have paid tribute in this article

FORTHCOMING EVENTS

*(Meeting marked with an asterisk * is open to the public)*

Tuesday, December 29

Radar and Electronics Association (at the Royal Society of Arts, John Adam Street, Adelphi, London, W C 2), at 7 30 p m —Dr K R Sturley "High Quality Sound Broadcasting" *

Wednesday, December 30

Royal Society of Arts (at John Adam Street, Adelphi, London, W C 2), at 2 30 p m —Dr J D Carthy "Animal Senses and Reactions" (First of two Juvenile Lectures Further lecture on January 6)

Institution of Electrical Engineers (at Savoy Place, London, W C 2), at 3 p m —Mr G G Gouriet "Colour Television" (Christmas Holiday Lecture To be repeated on Thursday, December 31)

Friday, January 1

Plastics Institute (in the Lecture Theatre of the Institution of Electrical Engineers, Savoy Place, London, W C 2), at 2 30 p m —Dr N A de Bruyne "Sticky Plastics" (Sixth Lecture for Young People)

APPOINTMENTS VACANT

Applications are invited for the following appointments on or before the dates mentioned

Lecturer in the Department of Veterinary Pathology—The Secretary, The University, Edinburgh (December 31)

Lecturer (preferably an experimental physicist with an interest in low temperature physics, electron resonance, or some other branch of solid state physics) in Physics—The Registrar, Queen Mary College (University of London), Mile End Road, London, E 1 (December 31)

Scientific Officer (with a first- or second-class honours degree in civil engineering or physics, or equivalent qualifications) at the Hydraulics Research Station, D S I R , Howberry Park, Wallingford, Berks, for studies of hydraulic problems in the field of civil engineering, including scale model investigations—The Ministry of Labour and National Service, Technical and Scientific Register (K), 26 King Street, London, S W 1, quoting E 489/9A (December 31)

Senior Scientific Officers/Scientific Officers (suitably qualified in physics, engineering and mathematics) in the Aerodynamics Division of the National Physical Laboratory, Teddington, Middlesex, for a programme of fundamental research on problems of flight at high speeds—The Ministry of Labour and National Service, Technical and Scientific Register (K), 26 King Street, London, S W 1, quoting A 535/9A (January 1)

Senior Lecturer in Clinical Biochemistry at the University of Melbourne, Australia—The Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W C 1 (January 4)

Advisory Officer (with a degree in agriculture or in pure science, a sound knowledge of poultry husbandry with experience of experimental work and advisory work among poultry farmers) in Poultry Husbandry—The Secretary, The North of Scotland College of Agriculture, 41½ Union Street, Aberdeen (January 9)

Physical Chemist (with a good honours degree and suitable research experience, preferably industrial, but not necessarily in the sugar industry) in the Department of Sugar Technology, Imperial College of Tropical Agriculture, Trinidad, West Indies—The Secretary, Imperial College of Tropical Agriculture, 40 Norfolk Street, London, W C 2 (January 18)

Chief (with high academic qualifications and research experience) of the Division of Entomology, Commonwealth Scientific and Industrial Research Organization, Canberra, A C T , Australia—Chief Scientific Liaison Officer, Australian Scientific Liaison Office, Africa House, Kingsway, London, W C 2, quoting Appointment No 180/157 (January 23)

Babcock and Wilcox Fellow in Nuclear Engineering—The Registrar, Queen Mary College (University of London), Mile End Road, London, E 1 (January 30)

Lecturer in Anatomy in St Salvator's College, St Andrews—Joint Clerk to the University Court, College Gate, St Andrews (January 31)

Librarian at the University of the Witwatersrand, Johannesburg, South Africa—The Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W C 1 (January 31)

Senior Lecturer/Lecturer in Chemical and Extraction Metallurgy at the University of New South Wales, Australia—The Agent General for New South Wales, 56–57 Strand, London, W C 2 (Australia, January 31)

Albright and Wilson Research Fellows in Chemistry (one at Pembroke College and one at Worcester College)—Dr C J Danby, Worcester College, Oxford (February 1)

Chair of Morbid Anatomy in the London Hospital Medical College—The Academic Registrar, University of London, Senate House, London, W C 1 (February 1)

Chair of Physiology in the London Hospital Medical College—The Academic Registrar, University of London, Senate House, London, W C 1 (February 1)

Lecturer in Veterinary Anatomy at the University of Sydney, Australia—The Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W C 1 (Australia, February 27)

Assistant Lecturer or Lecturer in the Zoology Department—The Secretary and Registrar, The University, Southampton

Cell Biologist (with a degree and research experience (preferably a Ph D.) in biology, microbiology or biochemistry), to take part in a research project on the fundamental biology of fibroblasts—Dr J M Mitchison, Department of Zoology, The University, West Mains Road, Edinburgh 9

Chair of Meteorology—The Secretary, McGill University, Montreal, Canada

Programmer (with good mathematical qualifications, and preferably either statistical or programming experience), to work on statistical problems arising from agricultural research and surveys—The Secretary, Rothamsted Experimental Station, Harpenden, Herts

APPLICATION OF SCIENCE IN INDUSTRY

WITH their third report, written for the Science and Industry Committee set up by the British Association in 1952 and re-constituted in 1954 with the additional sponsorship of the Royal Society of Arts and the Nuffield Foundation, Prof C F Carter and B R Williams complete the greater part of their work on the terms of reference of that Committee*. Their analysis of, and broad conclusions on, the factors governing the speed of application of science were reported in their first book, "Industry and Technical Progress", in 1957 In a second volume, in 1958, "Investment in Innovation", some of the earlier material was re-examined to elucidate factors which influence industrial investment in new plant and equipment Some of that material is again discussed in this concluding volume, which is concerned to outline a policy for action

The proposals set forth are grouped broadly according to whether the action required is by industry or by Government, and at the present moment, in view of the recent establishment of a Minister for Science, the second part of the book, in which various important aspects of public policy are examined, is of special interest The reader is left in no doubt that some conditions of technical progress are created by Government action, though he may be surprised at the limitations of existing knowledge as to the extent and effect of such action There is still, in fact, a very considerable field calling for further inquiry, especially perhaps on the financial side, as was particularly emphasized in "Investment in Innovation" On numerous points the facts on which public policy should be based have still to be determined, and while, like its predecessors, this third volume should stimulate as well as guide thought, there is nothing in it to urge hasty decision or action upon Lord Hailsham as Minister for Science

Profs Carter and Williams begin their consideration of the instruments of policy by which the Government can support and assist technical progress with a broad discussion of the strategy of Government aid—a discussion which is surely as broad as Lord Hailsham himself or Sir Hugh Beaver has already given, although it touches on some matters of Government policy directed at other objectives which may incidentally affect the advancement of technique This Government help may be provided by many different departments and State-sponsored bodies, for example, the National Research Development Corporation In some Departments, however, affairs may be involved in such instruments as purchase tax, which may incidentally hinder the adoption of new techniques Without entering on any analysis of the actual organization for Government assistance to research and development even, to the extent to be found in the survey made by a study group of the Royal Institute of Public Administration and published in 1957 in "The Organization of British Government", Profs Carter and Williams suggest that some re-assessment is needed of Government aid to research and development, designed to make it more likely that it will give help to industry at the points where, in the long run, help is most needed

This re-assessment would require separate consideration of the needs for advice, for assistance to research and for assistance to development, and at present Profs Carter and Williams doubt if it can be said that a Government policy on the application of science really exists The facts on which such a policy should be based, they assert, have never been collected or assessed Substantial research is needed, and the problem is both technical and economic, requiring extensive and continued study by a group containing both scientists and economists They do not think that such a group exists at present, but without it policy-making tends to go no further than a statement of generalities

It appears to be to the Advisory Council on Scientific Policy that the Science and Industry Committee looks for progress here, although it is implicit in what is written in the present report that the Advisory Council has been, particularly of recent years, too preoccupied with comparatively minor matters It is believed that Lord Hailsham intends to make increasing use of the Advisory Council, and he may well look to the Council for help in seeking answers to some of the more fundamental questions, such as the proper place and the right limit for Government action in speeding the application of science, the scale of Government effort, the extent to which it should be concentrated or widely diffused and, if concentrated, the points of maximum effort, to which answers must be sought and found before a national policy is formulated

Besides this emphasis on the need for much more patient fact-finding, stress is laid on the importance of 'cost- and profit-mindedness' in planning national research policy, as in planning research in an individual firm, and this aspect must be given due weight in making the inevitable choice between fields of effort It is duly noted that the Council for Scientific and Industrial Research appears to have this question of priorities very much in mind, but it is also clear that the Science and Industry Committee is somewhat reserved as to whether sound decisions can yet be made The report, in fact, goes no further than to suggest a few principles

The Committee hesitated, for example, to recommend more than occasional use of the policy of 'reinforcing success', helping industries which are already showing signs of lively innovation to advance still faster, although the principle deserves examination On the other hand, these studies support the policy of concentration at weak points, not indeed to the extent of helping weakness wherever it is found, but rather of helping industries unlikely to achieve rapid technical progress with their own resources, and especially those industries which have great promise of change or development There is no support for the practice, too common already in British industry, of bolstering the inefficient

---

* "Science in Industry Policy for Progress" By C F Carter and B R Williams Pp ix+186. (London Oxford University Press, 1959) 21s. net

Such a policy is not easy to apply, but obviously it is one which must be carefully considered in determining State policy towards the research associations in Britain Here the further suggestion is made that assistance for advisory services, including educational services, should be provided separately from that for research and specifically earmarked Such a step would have certain advantages in assessing the magnitude of the national effort in research, and the recognition of the educational work of the research associations is in keeping with the view that the Government's fundamental contribution to technical progress is in its support of training facilities Beyond that the question of balance between research and development is all-important

In this matter of development, some extension of the practice of establishing development companies by the research associations is recommended, as well as extension of sponsored research facilities The studies made for the Science and Industry Committee suggest, however, that existing facilities for the finance of development through the National Research Development Corporation are not fully used, and that Government support may need to go beyond the financing of development contracts While Government Departments as well as research associations should make full use of the experience and funds of that Corporation, it may occasionally be desirable to create State development companies to manage development in a defined field Nevertheless, every effort should be used to make the National Research Development Corporation an effective instrument of development on behalf of all Government-aided research bodies which cannot achieve adequate development from their own resources, and its powers to stimulate research (as well as development) should be used with vigour to fill in gaps which may appear in the structure of industrial research, or to recommend action for filling them to the national research councils

On this view there is a strong case for placing the National Research Development Corporation within the authority of the Minister for Science, and probably within the responsibility of the Advisory Council on Scientific Policy Its responsibility to the Board of Trade is obviously anomalous, and although Profs Carter and Williams do not commit themselves as to whether they regard the Corporation as sufficiently in direct touch with the economic as well as the technical problems of industry, they are in no doubt as to the value of its present work No evidence is presented as to the advantage which any new type of body would offer in assessing Government aid to industry as a problem in the joint use of economics and technology

On educational policy the report makes numerous sound and sensible comments, few of which are new, but some of which are still badly needing attention Such, for example, are the reminder of the waste of highly trained man-power which follows from an insufficient supply of technicians, and the clear warning that, unless corrective measures are taken immediately, a swift rise in the numbers of scientists and technologists available in the mid-1960's will be unmatched by an equivalent rise in the number of technicians and craftsmen, and the existing lack of balance will be made worse Again, while no evidence was found that industry in general is failing to get its fair share of first-rate men, the inquiry pointed to the desirability of further study of the cost of additional years of education in relation to the benefits to be expected. Here the evidence indicates that a higher scientific content in the education of most citizens would promote technical progress, partly by removing the obstacle which 'scientific illiteracy' offers to the communication of ideas, and partly because a greater reserve of people with some grounding in science would assist industry to meet demands, perhaps unexpected, for new types of technical skill

There are also sound comments on the importance of increased training for craftsmen and apprentices, increased attention to the education of technicians, and, by the universities, to the finding of the best form of education for managers , and the bearing of a better provision for laboratory technicians in schools on the supply of science teachers is duly noted Some of the points made in regard to the supply of science teachers have already been considered by the Advisory Council on Scientific Policy, but they are presented here in a way which shows very clearly their direct bearing on the responsibilities now entrusted to Lord Hailsham The educational implications of his task could not easily be summarized better, and he can scarcely overlook the emphatic suggestion that effective research in the use made of scientists and technologists would make the planning of educational facilities much more reliable

On taxation policy the report does not add substantially to the conclusions outlined in "Industry and Technical Progress" , and it gives little support to the view that high taxation discourages technical advance, although it concedes that it could do so It urges that it is difficult to devise reductions in taxation which will stimulate technical progress without also giving large benefits to firms in which progress is unaffected by taxation, or to firms which would be unprogressive whatever the level of taxation A lowering and equalization of taxes on expenditure, and a reduction in surtax rates would, however, probably favour technical progress, and when increases of taxes are necessary, widely spread increases are least likely to affect technical progress What matters most, however, is that changes in taxation should be as infrequent as possible, the Committee's studies confirm the conclusion that the uncertainty created by such changes and the expectation of tax changes have an unsettling effect on planning technical advance, and while the report recommends specifically the consideration of special investment allowances for development costs and also of a scheme by which firms would be allowed to write off their assets for tax purposes at any rate they chose, subject to adoption of the same rate in their accounts, these suggestions are subject to that over-riding consideration

Here again the importance of Lord Hailsham's recent appointment is evident If this consideration is to be given due weight at Cabinet level, it is important that the implications should be put to the Cabinet by a Minister whose responsibilities for scientific and technical progress are as unequivocal as are those of the Chancellor of the Exchequer in the financial field Moreover, there are other proposals advanced regarding the effect of taxation on technical progress which have far-reaching political implications, and can accordingly only be considered at a level where those political considerations can also be given due weight Likewise, the report rejects the idea that there is any general principle that protection favours (or retards) technical progress, and doubts are expressed as to the wisdom of abolishing independent review by the Import Duties Advisory Committee in applying the Import Duties Act, and as to whether issues of technical progress will be of regular substantial importance in arguing cases before the Restrictive Practices Court No changes are recommended in the legislation against restrictive trading agreements and monopolies, but strong support is lent to all that has been urged elsewhere as to the importance of management giving more attention to overcoming the fear of redundancy This is the most hopeful means of meeting the restrictive practices of labour, which do occasional damage to technical progress

So far as can be judged, therefore, the recommendations of the report are in line with the current trend of opinion in Britain and with much evidence that Lord Hailsham has now before him He has already, for example, declared his intention of strengthening the voice of the Advisory Council on Scientific Policy, though what is most wanted here is the authority which would ensure that due heed is paid to the findings and recommendations of that Council The stress once again laid on the importance of provision for research and technical education should also encourage proposals already in train, and, no less important, direct fresh attention to the question of balance and phasing. Lastly, the emphatic opinion expressed as to the serious handicap which insecurity of capital programmes can impose on technical progress is valid far more widely than in the nationalized industries, on which it is primarily based, and with a Minister for Science there is perhaps a better prospect of representations being made at a high enough level and an early enough stage to check excessive change.

THE HISTORY OF WESTERN THOUGHT

Wisdom of the West

By Bertrand Russell Edited by Paul Foulkes Pp 320 (London Macdonald and Co (Publishers), Ltd , 1959) 63*s* net

THIS is Lord Russell's second brilliant venture into a comprehensive history of Western (mainly philosophical) thought Again there is the freshness of style, the attempt to relate scientific, logical and sociological issues, though it should be said that, as in the earlier work, the selection of material on the whole is conventional Little attempt has been made, for example, to include more recent research into the medieval foundations of scientific thought, or again, if the relations of science and seventeenth-century philosophy are touched upon, the philosophical contributions of later centuries are given rather more in isolation from contemporary scientific currents None the less, the range is encyclopædic, stretching from the glory of Athens (which comprises almost one half the book) to Frege, Bergson, Freud, Wittgenstein, Jaspers and Sartre

The most fascinating aspect of the new book, however, is its illustrations historical sites and the great thinkers of the past mingle with reproductions of historical scientific apparatus, and these again with diagrams meant to illustrate the trend of an abstract argument, the whole capped by a number of compositions by John Piper an exciting excursion into the field of 'visual aids' No brief review could do justice to the mere pleasure with which the interested reader will turn over the pages, to be dazzled by the variety of the contents

Of course, despite the brilliance and apparent novelty of presentation, it should be realized that on the whole this is old wine poured into new bottles To be sure, many of the harsher value judgments of Russell's past writings have been toned down, and there is a generous inclusion of views with which Russell may not always have sympathized, like those of Vico, Bergson, Kierkegaard and many others But there are still the rough and ready divisions into the Continental rationalists (who are rather wicked) and the more virtuous British empiricists, supported arbitrarily by the quite unproved suggestion that the diagrams representing these two types of philosophical systems are, respectively, a pyramid standing on its head. as against the other, standing on its feet (p 219) If anything is true, it is that *any* theory of knowledge which claims to be based on a specific limited 'basis' on which all the rest is said to depend (whatever the nature of the basis) should be represented by a pyramid standing on its head . which is an example of the general criticism that the apparent plausibility of a diagram representing an abstract argument could be a dangerous tool in the hands of an unscrupulous teacher Bacon, as usual, is charged with completely ignoring deductive procedures, the use of hypothesis, and the notion of an underlying 'invisible' structure of matter, though so far as the evidence goes it is more likely that this was a matter of emphasis rather than omission Peirce (late nineteenth century) is credited with the foundation of the hypothetico-deductive method, a statement which only emphasizes the (usual) omission of earlier writers such as Whewell and Jevons, not to mention three centuries of medieval contributions to the subject Kant's thing-in-itself is made a condition of inter-subjective experience (p 241), which is (to say the least) a misleading appraisal , Mill's immensely subtle argument about the foundations of inductive reasoning is dismissed with the usual hackneyed remark that it is 'circular' These examples (though they could be argued) suggest that despite the undoubted sharpness and accuracy of most of the accounts to be found here, the author's authority is no substitute for caution on the part of the reader, particularly when it is remembered that the best of the histories of philosophy are those that are deeply felt and take up a certain position This becomes obvious when the discussion centres around the more recent of Russell's philosophical interests, such as pragmaticist theories of truth, when the argument, though still as lucid as ever, becomes rather more heated

But these are minor criticisms Certainly this new excursion into our cultural heritage is another astonishing venture testifying to the brilliance and almost legendary energy of its author

GERD BUCHDAHL

A HISTORY OF IRON AND STEEL IN CHINA

The Development of Iron and Steel Technology in China

By Dr Joseph Needham (Second Biennial Dickinson Memorial Lecture to the Newcomen Society, 1956) Pp xii+76+31 plates (London The Newcomen Society for the Study of the History of Engineering and Technology, 1958) 57*s* , 8 15 dollars

THIS book, an expansion of a lecture founded in memory of Dr H W Dickinson, who was educated at the Manchester Grammar School and at Owens College, is beyond doubt a first-rate contribution to scholarship. In the field of Chinese science and technology the author speaks with a unique authority based on both wide and deep knowledge

That China had an ancient and, for the times, an advanced metallurgical industry has long been known, but isolated as it was, the exact nature and chronology of this have been largely matters of conjecture So far as iron and steel are concerned, we now know how and when it developed, and a most astonishing story it is Although in Europe it was the end of the fifteenth century A D before molten cast iron was first produced except by accident, Dr Needham adduces the most cogent evidence to show that this was being done in China on a by no means insignificant scale two thousand years before How this was done, the product obtained, and the probable reasons —the existence of ores high in phosphorus producing highly phosphoric irons of increased fusibility and the invention of really effective double-acting bellows —are all referred back to the literary sources and illustrated The fifty-odd illustrations, ranging from cast iron moulds of the fourth century B C to photomicrographs illustrating modern investigations of the processes described, are all of great interest and value

From the second century B C , if not before, this cast iron was used to produce steel by a most carefully controlled decarburization in an air blast, the method of the 'hundred refinings' Rather later, much of the Chinese steel was made by a 'co-fusion' technique in which wrought and cast iron were heated together in crucibles, the pasty lumps of the former being bathed in the high-carbon liquid By a gradual diffusion of carbon a steel of approximately eutectoid composition can be produced In connexion with this production of steel one is inevitably reminded of the work of Réaumur of the very early eighteenth century A D The basic correspondence of these processes with those of Huntsman, Bessemer and Siemens and Martin is clearly very much in the mind of Dr Needham Indeed, so far as the Bessemer process is concerned, he points out that immediately before the work of William Kelly in the United States, four Chinese workers were imported as experts at his furnaces at Kuttawa

Many other topics are discussed, from magic swords and human sacrifices to assist the furnace produce the required product, to early Chinese tilting furnaces, and the abundant footnotes are often a sheer delight

This book on the development of the iron and steel industry has a special interest in view of the present-day small-scale production of iron in China, often by processes which cannot differ essentially from those here described We must now await even more impatiently a corresponding treatment of the non-ferrous metals

F C THOMPSON

USE OF ISOTOPES IN ORGANIC SYNTHESES

Organic Syntheses with Isotopes

By Arthur Murray, III, and D Lloyd Williams Part 2 Organic Compounds labelled with Isotopes of the Halogens, Hydrogen, Nitrogen, Oxygen, Phosphorus, and Sulfur Pp ix+1147–2096 (New York Interscience Publishers, Inc , London Interscience Publishers Ltd , 1958) 188*s*

MURRAY and Williams have produced a valuable contribution in this second part of their compilation of organic syntheses involving the use of isotopes While Part I dealt with the synthesis of nearly 500 compounds labelled with carbon-13 and carbon-14, Part 2 is devoted to a similar treatment of syntheses involving the isotopes of 8 other elements, compounds of bromine, chlorine, iodine, nitrogen-15, oxygen-18, phosphorus-32, sulphur-35, deuterium and tritium occupying 30, 15, 65, 151, 33, 30, 82, 400, and 54 pages respectively The book provides full practical details, in a format rather like that employed in "Organic Syntheses", for the preparation of several hundred individual compounds Each preparation is headed by the reaction scheme laid out with full structural formulæ, together with the reference from which it has been abstracted Then follows the "Procedure", a section of explanatory "Notes" and finally "Other Preparations" in which the literature dealing with the preparation of the compound is briefly reviewed

The compounds are classified under the element concerned and sub-classified according to the chief functional group, for example, acids and acid derivatives, amines, heterocylics, hydrocarbons, etc With this arrangement rapid scanning of particular sections is feasible, and the book thus provides a ready source for the chemist searching not only for possible recipes to prepare isotopically labelled compounds but also for high-efficiency, small-scale syntheses for 'unlabelled' compounds. The largest single section is that describing the preparation of compounds containing deuterium, which is in itself a useful collection of experiments in view of the current interest in mechanistic studies. The sixty or so pages of tables listing the hydrogen-deuterium exchange data culled from the literature are most valuable. The less extensive exchange data for other isotopes are also presented in tabular form. Tables of physical constants for isotopically labelled compounds are given where appropriate.

It has evidently been decided that the reader must buy Parts 1 and 2 and use them in conjunction for the joint index is in Part 2 and the "Introduction" is in Part I. This is doubly inconvenient and seems false economy, as the inclusion of a repeat introduction and separate index could surely not have added much to the cost of these already expensive volumes. The "Introduction" (30 pages) in Part I explained the layout and scope, the new system of isotopic nomenclature used, the special experimental techniques employed, and has short sections on several other important topics. It is annoying to have constantly to refer to Part I for this information. Apart from this question and some minor errors, for example, on p. 1455, ethynyl benzene is consistently referred to as vinyl benzene, this book is an excellent one which should be invaluable both in the library and the laboratory. It should have something of value for all chemists. G. EGLINTON

PHARMACEUTICAL RESEARCH IN THE U.S.S.R.

Soviet Pharmaceutical Research. Vol. 1: Pharmaceutical Chemistry. Pp. ii+447. 95 dollars. Vol. 2: Pharmacognosy. Pp. ii+401. 90 dollars. Vol. 3: Medicinal Chemistry. Pp. 556. 100 dollars. (New York: Consultants Bureau, Inc.)

RESEARCH into subjects of a pharmaceutical interest is being actively pursued in the U.S.S.R., but communication, due to language difficulties, is virtually non-existent. Workers in this and allied fields will appreciate the enterprise of those responsible for the three-volume translation into English of 'Soviet Pharmaceutical Research". Most of this work seems to have been originally published in the U.S.S.R. during the period 1949–1953, but nevertheless it contains much of interest to present trends in pharmacy generally.

Being an American-inspired translation, British readers should not be misled by the title of Vol. 1, "Pharmaceutical Chemistry". This would be better entitled "Physical Chemistry applied to Pharmaceutics", since it contains reports on 74 research papers covering such topics as solubility, stability, ion exchange, emulsions, suspensions and gels, as well as such diverse topics as conditions for preparing crystalline glucose and an investigation of the causes of granulation of powders. Subjects worthy of note in this volume are the influence of organic additives on crystal solubility; patterns of solubility change; the thermal stability of collagen in the dry state; and the decomposition of the binary compound of glucose with sodium chloride. There are interesting investigations into several aspects of emulsion technology utilizing gelatin and also a classification of pigments by their behaviour in suspension. In the analytical field, papers describe the application of infra-red absorption spectra to an investigation of the intermediate products of vitamin A and carotene syntheses.

In Vol. 2, entitled "Pharmacognosy", the papers are merely classified under the headings alkaloids, oils and glycosides, there being no attempt to provide any further subdivision. Provided that the publishers' selection of material is representative of pharmaceutical research being undertaken in the U.S.S.R., it would appear that the isolation of new alkaloids, their proof of structure and possible synthesis are the main preoccupations. No work is included on the chemical constituents of well-known drugs with the exception of some studies on the alkaloids of aconite. Chemical investigations are reported on the alkaloids of *Delphinium*, *Senecio*, *Orobanche* and *Leontice* as well as on the alkaloids of lesser known plants. Some work is reported on the chemical analysis of a few little known essential oils, and there is a paper on the polarographic estimation of some cardiac glucosides, including strophanthidin.

Vol. 3, 'Medicinal Chemistry", consists of translations of 91 original research papers on various aspects of this field of chemistry. One group of papers deals with the structure and activity relationships in antimalarials of the quinoline and acridine series. One paper deals with the production of nicotinic acid from the heavy bases in coal tar (236.5–247° C. fraction), and the yield of commercial nicotinic acid is stated to be in the region of 25–35 per cent of the fraction employed. Syntheses of several anti-tubercular drugs like opianic acid derivative of isonicotinic acid hydrazide and several homologs of *p*-aminosalicylic acid have appeared for the first time. The syntheses of several alkaloids like papaverine and emetine have been elegantly described. The synthesis of compounds with antithyroid activity and the preparation of amino-alcohols similar to ephedrine are presented in two papers which will attract the attention of synthetic chemists. The synthetic work in the field of anthelmintics of the coumarin series, and the investigations into the reactions of mercapto-amino-acids will be appreciated by those who are engaged in this type of work. The work on the synthetic studies of methylene-*bis*-5-alkylbarbituric and *spiro*barbituric acids has met with partial success.

The synthetic work in the field of amino-acids such as the synthesis of B-alanine, tagged ^{35}S-methionine and ^{14}N-sulphanilamidolysine, will attract the attention of biochemists. The research work carried out in the chemistry of chloromycetin analogues should be noticed, as the compounds prepared have been found to be active. There are three papers which describe the structural chemistry of gramicidin *C*. A theoretical paper by Nazarov deals with the nomenclature of synthetic steroids and related substances.

In general, this compendium of translations of selected papers from Soviet chemical and pharmaceutical journals gives a fairly good idea of the modern trends of pharmaceutical research in that country. The editors and the publishers of the volumes deserve thanks for compiling and reproducing this mine of information, even at the moderately high price, for those connected with pharmaceutical research. D. TRAIN

Theoretical Physics

Thermodynamics, Electromagnetism, Waves, and Particles By Prof F. Woodbridge Constant (Addison-Wesley Physics Series) Pp xiii+364 (Reading, Mass Addison-Wesley Publishing Company, Inc , London Academic Books, Ltd , 1958) 64*s*

THIS excellent book is the second of two volumes on theoretical physics by Prof Constant The first volume treats mechanics and vector analysis and the second, thermodynamics, electromagnetism, waves and particles Vector methods are used throughout the second volume and frequent references to the earlier volume are made For these reasons, it is probably best to use both books together The vector equations in both volumes make use of the operator ∇ only, the shorthand terms grad, div and curl not being used The main disadvantage of the second volume for students in the honours schools of physics in English universities is that it does not go quite far enough , the level reached approximating to two-thirds of the way along an honours course On the other hand, students taking a general science degree would find the approach rather sophisticated as such students are not usually brought up to the use of vector algebra It would appear, therefore, that such an expensive text will not find favour with students at English universities Nevertheless the book is well planned and the consistent use of vectors seems to make for a logical presentation It is a book that will probably be used more by teachers of physics than by students of physics in Britain Text and diagrams are admirably clear and the binding is excellent Examples are given at the end of every chapter and answers to alternate questions provided

R M TENNENT

High Speed Computing

Methods and Applications By Dr S H Hollingdale (Applied Physics Guides) Pp xii+244 (London English Universities Press, Ltd , 1959) 25*s* net.

IN recent years the automatic digital computer has become available to a wide field of potential users, either directly or through the agency of various computing services It is to these users rather than to the computer engineer that Dr Hollingdale's book is addressed

After a brief introduction to the binary system and to the representation of numbers in a computer, the author devotes nearly one-half of the book to the problem of how a computer obeys a programme This theme is elaborated with special reference to *Edsac* and to *Deuce*, which are examples of a typical single-address machine and a rather less typical multi-address machine The circuit techniques of digital computing are confined to two short chapters on storage devices and the logical design of computing circuits

It is the final chapters of this book that many will find of greatest interest A valuable chapter on the operation of a computing service, written mainly from the author's experience of such a service at the Royal Aircraft Establishment, is followed by four chapters on applications In addition to general topics, these cover the Monte Carlo method, the control of industrial processes and the machine translation of languages

This book is thus in the main concerned with the operation of machines as a whole rather than of their component parts, while the mathematics assumed is not above ordinary level of the General Certificate Examination This approach provides an ideal introduction to the subject for potential user and non-specialist alike

E M DEELEY

The Chemistry of Vegetable Tannins

A Symposium (Being the Papers presented at a Symposium held in the University, Cambridge, on April 12th–13th, 1956, under the auspices of the Society of Leather Trades' Chemists) Pp 160 (Croydon Society of Leather Trades' Chemists, 1956) 30*s* net

IN view of the efforts made in the last decade to bring order to the vast and complex arena of tannin chemistry this volume of collected papers by leading authorities in this branch of organic chemistry is particularly welcome A general paper on vegetable tannins (T White) is followed by a detailed account of estimations of components of vegetable tannin extracts (H G C King and T White) Descriptive papers on gallotannins and ellagitannins (D Burton and H G Munster), polyphenols of tobacco (W W Reid) and paper chromatography of polyphenols of tea (E A H Roberts) together with an account of the work on the constitution of chebulinic acid (O T Schmidt) and a summary of aromatic biosynthesis leading to tannins (Hathway) complete the first section The second part of the symposium is devoted to papers on leuco-anthocyanins (T Swain and E C Bate-Smith ; W E Hillis), catechins of oak and sweet chestnut (W Meyer) and dihydroflavonols (J E Gowan, E M Philbin and T S Wheeler) The final paper (W B Whalley) consists of an account of the stereochemistry of chromans and related compounds I feel that another instalment of this symposium would now be most welcome, especially in view of the intense activity in the subject

A I SCOTT

Handbook of the Petroleum Industry

Edited by G Sell and H A Dossett Pp viii+213 (London George Newnes, Ltd , 1958) 25*s* net

AS the editors are at pains to stress, this is not a text-book on petroleum, but rather a guide to those of the younger generation who contemplate a career in this vast industry It proves of interest, too, to those oil technologists and others so engaged because of the modern overall picture it presents of the manifold ramifications of the industry Besides the editors, ten specialists have contributed sections, devoted to geology, history, exploration, drilling and production, world oil resources, distribution, refining, oil shales, tar sands, petrol from coal, oil as fuel, petroleum chemicals, uses and future prospects, careers in the industry and the industry surveyed as a whole Generally, in the larger oil organizations, the recognized inter-related divisions to-day comprise (*a*) exploration and prospecting, (*b*) drilling and production (*c*) transport and storage, (*d*) refining and petroleum chemicals, (*e*) research, (*f*) marketing and distribution Thus a candidate for a career in oil has a wide choice for his or her talents, depending largely, apart from educational attainments and bias, whether overseas travel and work in the more remote parts of the world make fundamental appeal "Oil is where you find it" , this little handbook tells much about this, as it does about what is done, once found, to make it of universal service to mankind

THE ROYAL SOCIETY

ANNIVERSARY ADDRESS*

By Sir CYRIL HINSHELWOOD, P.R.S.

AWARD OF MEDALS, 1959

Copley Medal: Sir Macfarlane Burnet, O.M., F.R.S.

BURNET is among the most outstanding workers in the field of the viruses. Since 1925 he has made a long series of contributions to knowledge of the bacteriophages and he has elucidated the phenomenon of lysogenesis. He has shown how study of the range of activity of phages against various bacteria can be used to classify not only the phages but also the bacteria themselves.

He has studied many viruses pathogenic for vertebrates. He has shown how psittacosis is endemic in wild Australian parrots, and has thrown light on the epidemiology of herpes and poliomyelitis. He is well known for his development of several techniques for cultivating viruses in living chick embryos and their application in immunological studies of viruses. He has also made studies on the agglutination of mammalian and avian red blood cells by a number of viruses and virus-products, thereby throwing fresh light on the reactions taking place between viruses and the surfaces of susceptible cells. He found that an enzyme produced by cholera vibrios has an action on blood cells similar to that of influenza viruses.

From 1947 until 1951 Burnet worked on the reaction between influenza viruses and the muco-proteins on cell surfaces, and considered the mechanism whereby a virus can infect a cell. Between 1949 and 1958 he and his collaborators occupied themselves with the theme of genetic recombination between influenza virus particles carrying different, recognizable, marker characters. The possibility of a sort of hybridization between two virus strains was established. Burnet has applied these ideas in an attempt to understand how changes in virulence are brought about.

During the past few years he has turned to the study of fundamental aspects of immunity and has offered in a recent book on the 'clonal selection theory' a novel explanation of antibody production based on the idea of somatic mutation. His ideas about the body's ability to recognize 'self' and 'non-self' to a large extent predicted later findings on immunological tolerance. He applies the new ideas to tentative explanations of auto-immune diseases, of cancer and of ageing.

While so prolific of work and ideas, he has been of outstanding value in the councils of Australian science.

Royal Medal (A): Prof. R. E. Peierls, C.B.E., F.R.S.

Peierls's earliest work was on the theory of the solid state, a field in which he remains a leading authority. He has played an outstanding part in the development of 'fundamental theory', that is, in the formulation of what are believed to be the most basic laws of physics from which all other laws of Nature should ultimately be derivable. The subject-matter of fundamental theory changes over the years. In the late 'twenties and early 'thirties the term was practically synonymous with the relativistic theory of electrons and photons, and even as a very young man Peierls, with Landau, made an important contribution to one of the deepest problems in this subject, that of the limits of observability of physical quantities. When in the mid-thirties Yukawa initiated meson theory and so brought nuclear physics into relation with fundamental theory, Peierls's predominant interest was also in this field. His work with Bethe on the deuteron and that with Kapur on the theory of the compound nucleus are important landmarks of the period.

More recently, Peierls has directed his main, though not exclusive, attention to the general theory of quantal fields and of elementary particles. His best-known single contribution to this rapidly developing topic is a paper on the general derivation of commutation relations for arbitrary field theory, the idea of which has since been built into a great deal of modern work.

For many years Peierls has been a leading exponent of fundamental theory in Great Britain and an outstanding leader in theoretical physics as a whole. In Birmingham he has created a large and extremely active school, and if to-day young British and British-trained theoretical physicists enjoy a great reputation and occupy leading positions, this is largely due to Peierls's work.

Royal Medal (B): Prof. P. B. Medawar, C.B.E., F.R.S.

Medawar's research has been on the biology of senescence, the problems of tissue grafting and the effects of cells upon each other. To these difficult and fundamental subjects he has brought order and clarity, and experimental approaches of great originality.

In some of his earliest work he measured for the first time a property that can be called the growth energy of the chicken's heart, by determining the amount of an inhibitor needed to stop growth. He showed how the rate of decline of growth energy can be interpreted to provide a measure of senescence, and in this and subsequent work he explored with great penetration and caution the various concepts of ageing.

Study of problems of differentiation led him to the hypothesis (with R. E. Billingham) that cells of the adult skin may actively transfer hereditarily transmissible characteristics to their neighbours. In spotted guinea pigs the dark areas may gradually encroach on the light areas, which contain pigment cells lacking the enzymes necessary for melanin formation. The encroachment was shown to be due to the 'infection' of the light cells by the genes of their neighbours

---

* Delivered at the Royal Society on November 30.

Still more fundamental analysis of the problems of tissue inheritance and differentiation followed in Medawar's main work on tissue grafting A graft from one individual to another will not in general survive (except with identical twins) He showed that this was due to the fact that the graft induces the formation of an immune reaction by the host The power to react against homografts was, however, found to be prevented from developing if the host animal was injected very young with cells from the donor strain A mouse, 'tolerant' in this sense, could be made sensitive again if injected with cells from a live mouse of its own strain

Very recently Medawar and his colleagues have discovered ways of disintegrating cells ultrasonically without destroying their antigenic power By fractionation it was then shown that this power resides in the nucleus and not the cytoplasm and may be associated with compounds of deoxyribonucleic acid and proteins

These discoveries have thrown new light on the nature of the differences between individuals and open up important possibilities for their chemical analysis

Davy Medal · Prof R B Woodward, For Mem R S

Woodward is by general consent among the leading organic chemists of the world to-day His most important work has been in the field of natural products, and he has made major contributions to the elucidation of the structures of cantharidine (1941), penicillin (1945), strychnine (1947), sempervirine (1949), santonic acid (1949), patulin (1949), terramycin and aureomycin (1952), cevine (1954), magnamycin (1956), rauvomitine (1956) and gliotoxin (1958)

In the course of these studies he has contributed significantly to our understanding of biogenetic pathways, especially for strychnine and in steroid-triterpene relationships Characteristic features of his structural work have been the clarity and penetration of his reasoning and the extensive application of modern physical methods It was by his correlation of ultra-violet spectra with substitution patterns in unsaturated compounds (1941–42) that he made his first important contribution to chemistry The resultant 'Woodward Rules' have been invaluable, and his own subsequent use of ultra-violet and infra-red methods has been a model to organic chemists

Woodward's achievements in the field of synthesis are among the most spectacular features of organic chemistry in recent years His synthetic studies have included work on morphine (1951), and have resulted in the first syntheses of many other important natural products including quinine (1944), sempervirine (1949), patulin (1950), cholesterol and cortisone (1951), strychnine (1954), lysergic acid (1954), lanosterol (1954) and reserpine (1956) Not only are these syntheses notable for their elegance in conception and execution but also they have done much to bring stereospecific reactions into general use in the synthesis of complex molecules and have greatly influenced all recent work in this field

The scope of his work is further indicated by his demonstration of the aromaticity of ferrocene (1952), his work on reaction mechanisms, especially of the Diels–Alder additions, and most recently his contributions to our understanding of the theory of optical rotatory dispersion

Hughes Medal Dr A B. Pippard, F R S

Pippard has made outstanding contributions to low-temperature physics, and he must be considered one of the leading experimenters in this field He has combined first-rate experimental work with a mastery of theory

Starting with superconductivity, Pippard introduced an important modification to the London theory, a phenomenological description of the electromagnetic properties of a superconductor, which for many years has been an important guiding light in the subject He was led to this modification by his own experiments on the depths of penetration of currents in superconductors These were explained by the postulate of long-range wave-functions and thus non-localized effects, the current density at a point depending on the integral of the vector potential over a region (of about 10^{-4} cm) Later developments in the fundamental theory have tended to confirm the correctness of Pippard's conception

He also studied the anomalous skin effect in non-superconductors and gave a simple but complete picture of what happens when the mean free path of the conducting electrons is large compared with the skin-depth of penetration of high-frequency currents

More recently Pippard has carried out detailed measurements, again at high frequencies, on the surface resistivity of single metal-crystals, analysing the variations which occur in different directions related to the crystal axes In his work on copper, he has shown how such measurements can lead to a plot of the 'Fermi surface' of the metal By this is meant that a contour can be plotted of the way in which the positions of the valence electrons of highest energy are woven into the crystal-lattice structure This adds to our knowledge from X-ray crystallography of the lattice structure of the nuclei in a crystal, fundamental information about the geometrical pattern of the electrons

Pippard's work is characterized by deep originality, coupled with experimental ingenuity and a profound theoretical insight into his subject

THE INTERNAL AND THE EXTERNAL WORLDS

There has been no slackening in the flow of significant discoveries from the world of science The most spectacular event of the recent past has been the transmission from the Russian *Lunik* of photographs showing the remote face of the Moon, an achievement acclaimed equally by the layman and the man of science In a more recondite way interest has been aroused by an electrostatic theory of cosmological expansion, and in contrast with these escapes, in action or thought, beyond the bounds of the Earth, plans have been made for unprecedentedly deep drilling into its interior Syntheses such as that of coenzyme A and of 6-amino penicillanic acid have further strengthened the alliance of organic chemistry and biology, and the production of specific forms of deoxyribonucleic acid outside a living cell but primed by the presence of existing deoxyribonucleic acid has been another step towards the understanding of the material basis of life

Any of these things, and indeed many others, might well form themes for a presidential discourse, but with a special end in view I shall single out for mention one or two isolated and indeed rather specialized samples. These are chosen because they not only involve fascinating discoveries but also because they lead us to ponder once again on deep questions which should not be ignored by the contemporary man of science. They relate, in fact, to the concomitance of the inner world of conscious experience and the outer world of Nature. This extraordinary problem is always with us; but the unexpectedness of the new observations, though it does not really disclose new kinds of mystery, does reawaken us to awareness of something, the strangeness of which familiarity tends to dull.

The social life of insects cannot but fill the onlooker with wonder, and arouse speculation about the conscious elements which may lie behind the behaviour manifest to an observer. Nobody intimately acquainted with individuals among the higher animals can seriously doubt that they possess some inner life, perhaps not entirely unlike our own. But that of the insects is by our standards likely to be very peculiar indeed; yet there is in all probability an intelligible pattern to it. The Rothamsted work on the 'queen substance', transmitted from the queen bee to the other members of the hive, shows how this chemical compound regulates the whole reproductive process of the bee community and dominates the organization of their lives.

The inward concomitants of the observed behaviour we can scarcely imagine, and indeed the control of highly complex individual and communal actions by a chemical substance could easily suggest a purely behaviourist view of living creatures, and lead to the denial of the internal world altogether. This I believe to be philosophically wrong.

Another recent research provokes us to think about the matter, as it were in the reverse order. We are familiar enough with human colour vision and can scarcely doubt the existence of this as a personal experience. The external conditioning of it has recently been stated by Land to differ very surprisingly from what had been supposed, and to be of a quite extraordinary character. The essential experiment is made in the following way. A coloured scene is photographed by means of a split-image camera simultaneously through two filters, one of which cuts off the upper half of the visible spectrum and the other the lower half. Two black-and-white positive transparencies are thus prepared. These are projected separately each with a different monochromatic light, for example, two yellows differing in wavelength by a few hundred angstroms, and the images are recombined. The resultant produces in the observer the whole gamut of colour sensations. Thus information can be supplied to the brain so that, as Land puts it, "the eye functions to see full colour in a universe involving only a narrow wavelength band".

The question of the relation of the internal to the external world is again brought into sharp relief by these remarkable findings.

The topics I have mentioned can, of course, be treated without specific reference to these problems, but they lose a great deal of their interest if the implications about consciousness are ignored or denied. There is indeed one group of researches, carried further during the past year, in which these implications cannot possibly be evaded, namely, those in which physiological stimulation of the conscious brain is correlated not only with the behaviour of animals but also with the psychological experiences of a human subject.

The central problem of mind and matter is not always thought worthy of their attention by men of science, yet it was given profound consideration several decades ago by Sir Charles Sherrington, and we are vividly reminded of it in the most recent book of one of our senior Fellows, Lord Russell. At a moment, too, when Darwin is again very much in our minds, there are certain aspects of the whole matter about which it is highly important to think clearly. The question raises a still more general issue which I should first like to consider. There are few worse condemnations of a theory than to label it metaphysical, a term suggesting the attempt to arrive at truth by speculation divorced from experiment or to interpret reality by statements empty of scientific sense. Little enough enlightenment is afforded by such an assertion as that the orbit of a heavenly body has a given geometric form because this constitutes the perfect figure. Scientific theories are properly expected to account for many things in terms of few, to predict new phenomena or to yield verifiable, quantitative results. Yet too austere an application of this principle can segregate the world of science from the general world of intelligent appreciation, an unfortunate event at a moment when there is growing realization of the interest of science to the community at large.

Most men of science would disclaim any great concern with philosophy and especially with metaphysics. But what is metaphysics ? In the last resort it is the search for a statement subsuming the ultimate nature of all reality. Science has more modest hopes, and modern physics led the way to a considerable renunciation in this respect which has had a profound influence on philosophy itself.

Yet in science the total neglect of philosophical aspects may be unfortunate. It can lead, on one hand, to statements which are sensational but unsound, and, on the other, to an unhealthy indifference to the relationship of science to existence in general, and in any event, even though science may seem to decline metaphysical statements, it not only throws out challenges to philosophy but also is frequently itself confronted with problems inescapably philosophical in nature.

Scientific theories, though less ambitious than the systems of the older philosophers, and though claiming neither universality nor finality, do aim to be comprehensive and do hope to stand the test of time as long as possible. Moreover, we do judge them by a criterion in which it would be hard to disclaim every metaphysical tinge, namely, by the degree of mental and æsthetic satisfaction they afford. However much we may protest, utility is not enough. There is, undeniably, in the law of gravitation some quality distinguishing it from a set of empirical formulæ, however convenient. Men of science do, unconsciously at least, place hypotheses about Nature in a sort of hierarchy of esteem, where the conservation of energy and the second law of thermodynamics rank high and mere working rules rank low.

The difficulty of complete aloofness from philosophy is illustrated by parts of physics. The theory of relativity dominates cosmology and defines the relationship between matter and energy. The quantum laws and the Pauli principle provide the foundations of chemistry. Yet these powerful and productive generalizations involve distinctly metaphysical elements Although it seems to have been relatively late in the development of thought that a clear distinction between subject and object, between the external world and the observer was recognized at all, for most men of science there was not much question about it at the beginning of the present century Einstein, however, asserted the meaningless character of space and time abstracted from operations with measuring instruments and clocks and thus established the observer as an indispensable participant, whose status was increased by the 'uncertainty principle'

According to the Pauli principle, observability becomes identifiable with the very possibility of existence Thus the foundations of inanimate Nature can scarcely be discussed without recognition of the inadequacy of earlier spatio-temporal descriptions of reality, and without admission that subject and object had been in some respects too crudely separated

The fundamental laws of quantum physics can be summarized in the wave equation and in a set of rules for its operation Some people, it is true, say that they are content to accept these without deeper inquiry But in fact every one, whether he admits it or not, seeks something which he calls understanding The professed empiricism about wave mechanics is half-hearted, and more often than not the abstract mathematical formulation is given a metaphorical translation in which symbol and reality become very much confused 'Waves of probability' are created, electrons become 'clouds', potential barriers are 'tunnelled through'

When sound metaphysics goes, the seven devils of bad metaphysics soon enter to fill the gap and give an illusion of clarity Metaphors which may be helpful in illustration easily take control when the abstractness of the mathematical formulation becomes too austere, a fact which bears witness to the insistent demand of the mind for satisfaction by something beyond utility

Incidentally it may be remarked that if the more serious and responsible men of science remain aloof from the task of relating their subject to its philosophical background, the less serious and responsible will do it for them, and will startle the uninitiated with fantastic paradoxes which may impress the layman, but do science real harm The discovered facts of Nature are mysterious and impressive enough in their own right That light seems to recede from relatively moving observers at the same rate that the universe may look much the same from anywhere that measured mass may vanish into energy of radiation that states of energy form a discontinuous series that indistinguishable particles cannot co-exist that in the world of small enough dimensions particles and waves lose the significance suggested by macroscopic analogies none of these needs dressing in sensational form to make its impact on the thoughtful mind

Nor, on the other hand, are they merely to be made the basis of formulæ for the sole purpose of computations In the last resort what men of science search for is the vision of Nature, and this must be expressed and communicated in those terms which provide the nearest approach to real understanding

If this is true of the physical sciences, it is equally so of biology One of the transitions from physics to biology is illuminated by a remark of Heisenberg "The mathematical formulæ indeed no longer portray nature but rather our knowledge of nature"

The question, then, of the relation of the internal and the external worlds cannot and should not be ignored by men of science

It is surprising that biological discussions often under-estimate human consciousness as a fundamental experimental datum In science we attach no value to unverifiable deductions, or to empty qualitative statements, but nobody defends the neglect of experimental data Among these we cannot validly disregard those of our own consciousness except by a deliberate abstraction for which we must assume responsibility, and which we should not forget having made

It is tempting to ignore observational facts when they seem intractable, since we rightly abstain from the attempt to arrive at the truth by speculation But in this we are not always consistent, and indeed very important philosophical conclusions are sometimes propounded by men of science Moral and æsthetic qualities in man, for example, are not infrequently said to be explained by the operation of natural selection Again, it is sometimes asserted that suitable combinations of machines could, in principle, produce results indistinguishable by any operational test from animal or even human behaviour

The mind–matter relation is quite often dismissed as non-existent or meaningless But moral qualities are not explained by natural selection, human behaviour is not machine-like and the mind–matter relation cannot be ignored in an intelligent consideration of existence

The approach to the problem of consciousness must admittedly be egocentric I have to begin logically with the, to me, indisputable fact that I have a wide range of conscious experiences (which are indeed more important to me than anything else) The significance of this fact can be questioned in two ways first, by the objection that so far as any operational test goes other people may well be behaving simply as machines, and secondly, by the assertion that my consciousness is a more or less irrelevant concomitant of behaviouristic reactions

I am, it is true, not certain that other people have consciousness Neither indeed am I certain that the atomic nucleus exists But I regard its existence as in the highest degree probable I regard consciousness in other people as equally probable and for similar reasons The atomic nucleus is not directly observed It is inferred by elaborate reasoning from many complex experiments, any one of which could probably be given alternative interpretations What carries conviction is the fact that a coherent body of doctrine emerges from large numbers of varied tests

We are all the time trying experiments on our relations with other people, informing, asking, ordering, obeying, resisting, with varying emotions which are correlated with our actions Human evolution has developed an elaborate and sensitive communication system, brought into play in innumerable ways The hypothesis that other people have an interior life not unlike my own enables me to register correspondences at point after point in so intricate a way that I accept the hypothesis, if not as absolute truth, then as something nearly as good And with most of the basic conclusions of science I am in no position to demand more

Thus the content of consciousness must rank as something directly experienced by everyone, and therefore as providing observational data. This conclusion is not changed in the least by the consideration that the development of communication between individuals confers a biological advantage and is favoured by natural selection in so far as mutual assistance and the transmission of acquired knowledge can assist survival. The communication mechanisms exist and one of their uses is to enable us elaborately to test the coherence of predictions from the hypothesis that conscious life is on the whole much the same for different people. People like poets and novelists describe this inner life: their writings serve little enough biological purpose, but they are (sometimes at least) intelligible to the rest of us, and evoke memories of our own experiences, which check as significantly as those coincidences of calculations and dial readings on which we base our views about the physical world.

Nor can the observational data of consciousness be relegated on the ground that they are on the whole qualitative rather than quantitative. Science has to come to terms with qualities, and indeed Weisskopf has pointed out that the quantum theory itself introduced fresh qualitative distinctions into a region where classical physics expected only quantitative differences.

The conscious experience is sometimes set aside as supernumerary and irrelevant, on the ground that a machine can perform actions indistinguishable from those of a man (or with greater technical perfection could do so). The answer that machines like the so-called electronic brains work only to a 'programme' brings the rejoinder that a set of machines could itself be programmed by another machine. But the master machine would itself need a programme. This would have to be provided by another machine, and so on in an infinite regress, there being no way in which the sequence could be closed to a self-contained cycle.

The contention that a human being is a system of self-programming mechanisms seems to depend upon the error of neglecting relevant observational facts, those of consciousness belonging to precisely this category. In its higher functions the human brain is programmed, not by other mechanisms, but by æsthetic and moral elements which somehow have their seat in the consciousness, by elements, that is to say, which belong to the half of reality concerned with the observer rather than the observed. Of the concomitance of consciousness with brain processes there is no doubt, but concomitance does not mean identity. Changes in the electron-levels of an atom are associated with the emission of light quanta, but a photon is not a difference of quantum states. Nor in a concomitance of A and B is it justifiable to assert that A is the cause of B without admitting the possibility of a reciprocal relation. In particular, if we assert that physical happenings in the brain can affect consciousness, we must admit in principle that physical happenings in the brain may be consciously caused.

But it is an abstraction to speak of either category in isolation. For many purposes the two may be separated as a legitimate approximation, but this does not mean that they can be regarded as independent.

In parts of biology questions of consciousness are not of direct importance but cannot in general be set aside. Behaviourism might give a good approximation in describing the actions of intercommunicating individuals in a group, but it ignores the experimental datum, known to each individual about himself, and, by the coherence argument, about others, that in their conscious minds what men individually think or feel is of far more importance to them than any mechanical part which they may play in the biological community.

There is, of course, a clear enough meaning in the statement that consciousness and moral and æsthetic feelings are developed by evolution and natural selection. The power of conscious reasoning increases the chance of individual survival: social instincts favour the survival of the community, and are related to moral feelings. Æsthetics enter deeply into intellectual activity. There need be no difficulty in agreeing that these things have selective advantage. But the recognition that something present will be selected gives no clue whatsoever to its actual nature or genesis. For the purposes of natural selection a purely unconscious reaction of the brain and nervous system would have sufficed. Beneficial reactions indeed need have no conscious counterpart, as is widely evident in human physiology. But behaviouristic descriptions in general are models and abstractions ignoring data which, so far from being trivial and irrelevant, are the only things which make us *inter alia* concern ourselves with science at all. In any event, if free will, moral feelings and other conscious elements are illusions superposed on a behaviouristic background, wherein can lie their selective advantage?

There is at present no obvious answer to the question of what kind of advance can possibly be hoped for in the problem of psycho-physical concomitance. This, however, is no reason for giving up thought which at least helps to avoid the kind of errors so easily made both about physics and about biology when the problem is ignored.

It would, moreover, be a mistaken policy for men of science to withdraw from the inquiry. Lucretius might well have been asked how any real knowledge of his primordial particles could ever be obtained and would have been unable to answer. Before Galileo and Newton there were no appropriate concepts in terms of which to understand the flight of a projectile. At one time the rusting of iron must have seemed a process *sui generis*. The discoveries of science and the evolution of its grammar go hand in hand. Negative predictions are discredited by the famous pronouncements of Comte: "Toute recherche qui n'est point finalement réductible à de simples observations visuelles nous est donc nécessairement interdite au sujet des astres. . . . Nous concevons la possibilité de déterminer leurs formes, leur distances, leurs grandeurs, et leurs mouvements ; tandis que nous ne saurions jamais étudier par aucun moyen leur composition chimique."

In the earliest times the description in rational terms of physical Nature was not so much an unsolved problem as one which people did not even conceive.

Human knowledge will not be in a satisfactory state until the dichotomy of the internal and the external is somehow removed.

In one way the man of science, because he starts by demanding least of an explanation, is the most likely to succeed in finding it. The question might be asked: What happens when an atom emits light? The more naively this is considered the less is an answer possible. But the laws governing various correlations, change of atomic state with quantum emission, or quantum with field have been formulated in terms of concepts appropriate to the problem, and they yield satisfaction not only by making possible quantitative predictions but also by an inherent elegance Eddington once discussed the way in which the terms of physics link together in endless cycles and pointed out that in one way Newtonian mechanics constitutes a vast tautology This is often true in so far as physical theories create, as it were from nothing, a series of definitions and concepts by the aid of which things previously intractable are brought together into order and intelligibility

In the light of this analogy, the further exploration of the concomitance of the internal and external worlds appears less permanently hopeless The right grammar and language need to be evolved In the process the present bounds of science may expand, but they have never been established by a firm decree Chemistry and physics have united with biology and penetrated regions once thought inaccessible Physiology is already allied with psychology and together they may search in strange and hidden places There will no doubt be difficulties of which Freud's struggle for acceptance provides a warning example, but it may be recalled that chemistry and physics themselves arose from a welter of charlatanry magic and surmise as the correct language in which to describe their phenomena grew up There are so-called para-scientific aspects of biology and psychology, which to-day show all too often the discouraging characteristics of the worst days of alchemy Yet the history of chemistry warns against a final condemnation

In the meantime those numerous studies are to be welcomed which, without solving the central problem, keep it constantly alive observations on individual and communal behaviour in animals, on perception and illusion investigation of the processes of learning and memory, construction of machines which imitate the mental functions, search into the phenomena of sleep Above all, there lies hope that sooner or later to the eye of genius some quite ordinary phenomena will reveal, like the fall of Newton's apple, an undreamt of but thenceforth obvious significance

THE SHAPE OF PROTEIN MOLECULES SUGGESTED BY ELECTRON MICROSCOPY

By DR. R. C. VALENTINE
National Institute for Medical Research, Mill Hill, London, N W 7

THE weights of most of the important protein molecules are now known with a fair degree of certainty Apart, however, from some of the fibrous proteins such as collagen, speculation about their shapes and sizes is less surely based The weight of a protein molecule when multiplied by the readily determined value for its partial specific volume gives the volume of the anhydrous molecule Therefore, if protein molecules were compact spheres, their diameters would be known, and values calculated in this way from available data[1] are listed in Table 1 for various proteins But a diameter can also be calculated[1], again on the assumption of a spherical molecule, from the hydrodynamic behaviour of the protein, in particular from its rate of diffusion and sedimentation in the centrifuge and the viscosity of its solution In almost every case this diameter comes out to be significantly larger than that indicated by the molecular weight, the ratio of the two values giving the frictional ratio for the molecule There are three possible explanations for the discrepancy, that is, for frictional ratios greater than unity (1) the molecules may carry water either internally or as a surface layer, and thus behave in solution as larger objects than the calculated compact anhydrous size , (2) the molecules may be elongated rather than spherical , (3) the hydrodynamic formulæ involved in the calculations may not be strictly applicable to protein molecules

The third explanation is not always considered, but in fact there is no compelling evidence that molecules behave like smooth, rigid bodies, as theoretically required , nor indeed any direct evidence that the formulæ used are valid for objects as small as a molecule The two other possible explanations are usually both taken into account and lead in the following way to a picture of the molecular shape The extent to which proteins are hydrated is not easily measured, but 0 3 gm water bound per gm protein is thought in most cases to be a good estimate Assuming some such figure, one can next calculate from theory[2] the ratio of the length to the width of the molecule that would then account for its behaviour Table 1 shows the results of these calculations The molecules are assumed to be ellipsoids—either prolate (cigar-shaped) or oblate (disk-shaped)—but provided the structure is rigid, the length-to-width ratios are not critically dependent on the exact model Except for ferritin, all the proteins listed come out to be distinctly elongated, and it is as long prolate ellipsoids that these protein molecules are usually visualized

The electron microscope, with its limit at a resolution of 15 A , ought now to be capable of confirming these theoretical deductions by showing the shape of the anhydrous molecules directly on a photographic plate That it does not do so is due to the low electron-scattering power of proteins, and in practice no untreated molecule with a molecular weight less than about 2 million can be detected at all However, the contrast is greatly increased by metal shadowing and in this way Hall has obtained some fine pictures, for example, of catalase[3] and fibrinogen[4] But such pictures require exceptional technical skill, and as usually employed the metal coating is too grainy to give a reliable picture In addition, the structure of the supporting film is inevitably brought out and can cause confusion But even allowing for these difficulties, it is curious that in every attempt so far published the electron microscope has failed to show the expected elongated forms of the protein molecules

A method that shows very fine detail on the surface of virus particles has recently been developed by Brenner and Horne[5,6] and which they have termed

Table 1

Protein	Molecular weight	Volume of compact anhydrous molecule ($A.^3 \times 10^{-6}$)	Diameter of molecule if a compact sphere (A.)	Ratio length/width of molecule to account for behaviour if 30 per cent hydrated	Hydration required to account for behaviour if molecules are spheres (per cent)
Glutamate dehydrogenase	$1·0 \times 10^6$	1·25	134	3·5	95
Thyroglobulin	$6·3 \times 10^5$	0·76	113	4·2	120
Urease	$4·8 \times 10^5$	0·59	104	3·2	85
Ferritin	$4·7 \times 10^5$*	0·59*	110	1·0	30
Legumin	$3·8 \times 10^5$	0·46	96	7·0	230
Catalase	$2·5 \times 10^5$	0·31	84	3·4	90
γ-Globulin	$1·6 \times 10^5$	0·20	73	5·9	190
Serum albumin	$6·6 \times 10^4$	0·08	54	3·4	95

* Figures refer to the protein component of ferritin which in addition contains 20 per cent iron.

'negative staining'. Using spray droplets, they partly embed the virus in a layer of neutralized phosphotungstic acid and the relatively transparent objects appear with great contrast against a nearly opaque and structureless background. This is the reverse of the usual appearance and 'negative contrast' is perhaps a better description of the effect achieved. It seemed that a similar method might also be useful for showing up the larger protein molecules. For this application the original procedure was modified as follows. The protein at concentrations of between 0·1 and 1·0 mgm. per ml. was made up in 0·02 *M* phosphate buffer *p*H 7·8 and an equal volume of 1 per cent sodium tungstate added. The technique depends essentially on avoiding any interaction between the tungstate and the protein, and for this reason the *p*H was maintained well above the isoelectric point. It was found helpful for the electron microscopy to add polystyrene latex spheres of 0·2μ diameter[7], which can be seen easily on the screen in negative contrast (that is, bright on a dark background), if the preparation has been satisfactory. The protein solution is sprayed on to the specimen supports exactly as described by Williams and Backus[8]. When the electron micrographs of the preparation are examined, the protein molecules appear as clear points in 5–20μ droplets of dark structureless material. The procedure is rapid and some of the risk of distortion by surface forces is avoided since the drops set rather than dry. The molecules should be well preserved, and in fact simple tests have shown that proteins dried in the droplets and then re-wetted are still largely undenatured (for example, enzymes remain active).

Experiments with purified preparations of the larger proteins soon showed that while some gave pictures of high contrast, demonstrating convincingly the power of this new technique, others were almost equally disappointing. This was not related to molecular size, for in fact some of the smaller molecules appeared with the greatest clarity. The difference may possibly lie between proteins that are internally hydrated and those that are not. The tungstate can penetrate very small holes (this sort of technique was first used to demonstrate the 15 A. hole along the axis of the tobacco mosaic virus rod[9]) and any molecule having an open sponge-like structure may fill with tungstate and be almost obscured. Although preventing good pictures of some interesting proteins from being obtained, this penetration may indicate which molecules have extensive internal hydration.

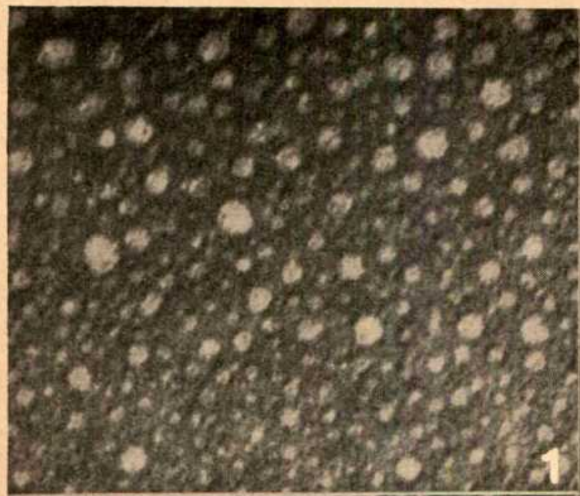
The proteins listed in Table 1 were all examined by this negative contrast technique, and some of the pictures obtained are shown in Figs. 1–6. Points particularly noted about each are now discussed.

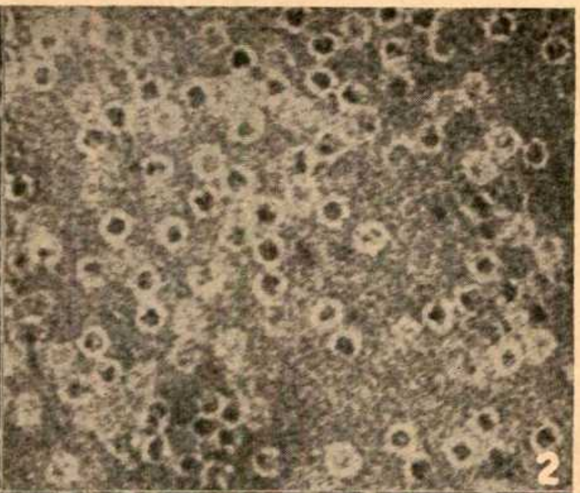
L-*Glutamate Dehydrogenase* (*Glutamic Acid Dehydrogenase*). The unusual behaviour of this protein in the ultracentrifuge[10] has suggested that the molecule can dissociate reversibly on dilution into smaller units. Similar dissociation has also been observed in the presence of substrate[11], while in the presence of coenzymes re-association occurs[12]. The molecular weight of the undissociated molecule has been measured as 1,000,000 (ref. 10), and it is suggested[11] that this represents a tetramer that can split into a dimer and then a monomer. Our electron micrographs lend support to these ideas. The objects seen varied in size, depending on the concentration at which the protein was sprayed. At suitable dilutions (about 0·5 mgm. per ml.), three sizes of roughly spherical objects could be seen (Fig. 1) measuring 125 A., 90 A. and 75 A. The cubes of these numbers (which give a measure of volume) are almost exactly in the ratio 4 : 2 : 1. Smaller debris was also usually present. The largest objects appeared slightly smaller than the size of 134 A. calculated for a molecule of the molecular weight reported, but the difference might not be significant. While these electron micrographs certainly support the picture of the molecule as a tetramer, they do not suggest a simple aggregate of 4 units. On dissociation, the molecule appears as if it has broken into two or four equal pieces which have re-formed into round irregular shapes. Thus although dissociation is said to be accompanied by a fall in axial ratio[11], there is no obvious change in shape to account for this.

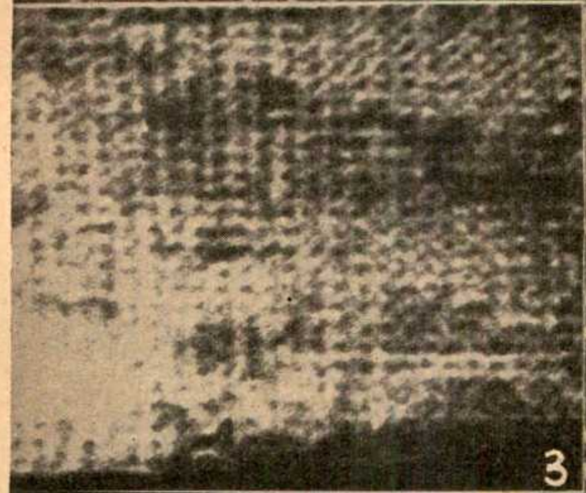
Thyroglobulin. Despite its large molecular weight, the molecules of this protein were almost indetectable by the negative-contrast technique. Vague round objects measuring about 140 A. across could just be made out, and objects of similar size were seen in metal-shadowed preparations. It may be that this molecule has an open structure that is easily penetrated by the sodium tungstate and occupies a volume roughly twice that calculated for a compact molecule of this weight.

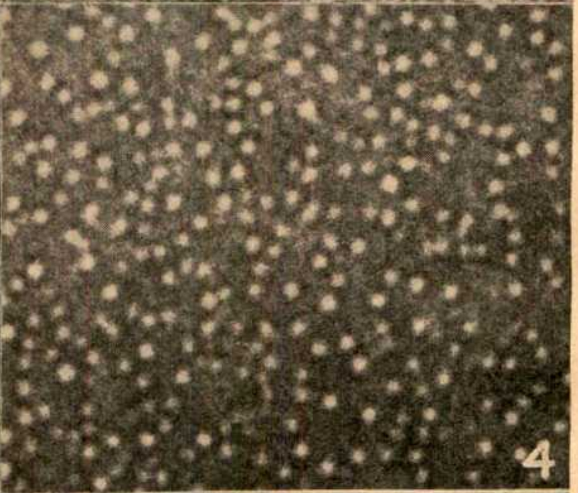
Urease. The molecules were similarly scarcely detectable. A diameter of about 130 A. was suggested, again giving a volume almost twice that of a similar compact molecule.

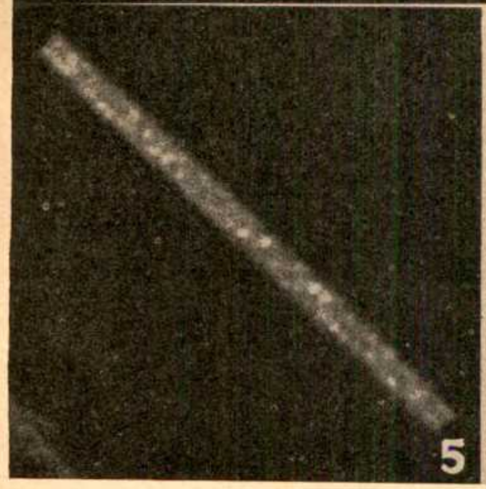
Ferritin. The structure of this molecule deduced from X-ray scattering has been described recently[13] and the findings correlated with previous work. The molecule contains 20 per cent iron (as ferric hydroxide) at its centre, this iron being free to move in and out











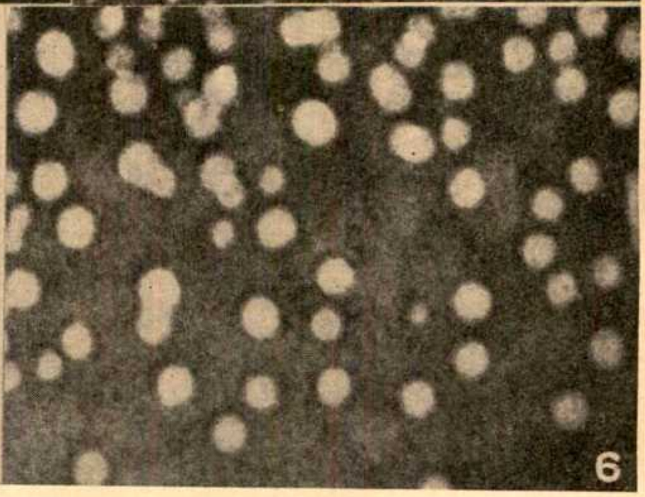


Fig. 1. Molecules of L-glutamate dehydrogenase. × 400,000

Fig. 2. Molecules of ferritin. × 400,000

Fig. 3. Molecules of catalase in a small crystal. × 400,000

[Fig. 4. Molecules of γ-globulin. The centre to centre spacing of molecules that touch is 70 A., but the extreme edge of the molecules is not clearly shown on the print. × 400,000

Fig. 5. Tobacco mosaic virus rod with molecules of γ-globulin antibody on its surface. × 250,000

Fig. 6. Molecules of macroglobulin. × 400,000

without disarranging the protein shell The form of the iron core has already been studied with the electron microscope[14] and its varying appearance interpreted as differing aspects of four closely spaced micelles The negative contrast pictures (Fig 2), while still clearly showing the central masses of iron, give a better picture of the outline of the surrounding protein Some of the molecules can be seen to be partly or completely deficient of iron The protein shell is about 25 A thick and the diameter of the molecules measures 110 A

Legumin A sample of this plant globulin was kindly supplied by Dr P Johnson (Department of Colloid Science, Cambridge) and the full physical data and findings will be presented elsewhere The negative-contrast technique showed the molecule as a short cylinder 85 A in diameter and 85 A high A hole 15 A wide was seen to run along the axis from one end of the molecule to the other The volume of such a solid corresponds closely with that calculated from the molecular weight, but the electron microscope again completely fails to show the asymmetrical shape required to fit the hydrodynamic data

Catalase The molecules of catalase appeared as slightly elongated rings or as two parallel lines, suggesting end-on and side-on aspects of a hollow approximately cylindrical shape The identification of such objects as catalase molecules was confirmed by obtaining pictures of the surface of small crystals of the protein (Fig 3) The same ring-like forms can be seen in orderly array, the molecules measuring 60 A across their short axis and 85 A across the long one The molecules in the crystal appear to interlock almost completely, not just to touch , thus the width is very little greater where two rings meet in the crystal than it is in a single ring in isolation This may suggest that the molecule has some sort of helical form that allows the surfaces to interlock The height of the molecules cannot be deduced from the electron micrographs of the crystal, but measurements of isolated molecules seen on their sides suggest a height of 70 A From metal-shadowed pictures of catalase crystals, Hall[3] has deduced a height of about 60 A The thickness of the ring when the molecule is seen end-on is about 20 A and this figure with a height of 70 A fits well with the molecular weight of 250,000 The suggested shape is also consistent with Hall's pictures of catalase molecules[3], but the granulation in the metal shadowing partly masks the appearance of rings, and as a result he interpreted the electron micrographs differently

γ-Globulin The molecule is traditionally pictured as cigar-shaped with a length-to-width ratio of about 5 : 1 The negative-contrast technique shows a perfectly round molecule of diameter 70 A (Fig 4) Similar molecules were seen attached to viruses after treatment with specific antiserum Fig 5 shows a tobacco mosaic virus rod after such treatment and a number of γ-globulin molecules (antibodies) can be made out on its surface

Serum Albumin Repeated attempts to show the molecule of albumin in the same way have failed All that has appeared are vague round forms 70 A in diameter and objects too small to be the intact molecules measuring 30 A A possible suggestion is again that this molecule has an open structure largely penetrated by the sodium tungstate

Macroglobulin A sample of globulins from a pathological serum was examined In the ultracentrifuge this had shown, in addition to the usual γ-globulin peak, other peaks at 16 2 *S*, 22 5 *S* and 29 6 *S* The electron micrographs of this material (Fig 6) showed various sizes of spherical molecule with diameters close to 70 A (normal γ-globulin), 100 A , 125 A and 150 A

This preliminary survey of protein molecules with the electron microscope has clearly shown two points The first is that the negative-contrast technique is a valuable method for showing the shape of many molecules, and the possibility of studying molecular interactions in the same way is opened up Secondly, the question that has frequently been raised of late as to the significance of the frictional ratios calculated for molecules is now even more in dispute In the case of ferritin, the values obtained[15] for the sedimentation and diffusion constant fit well with the observed nearly spherical shape (the axial ratio calculated was originally given as 3 4, but this seems to be an error) The nearly symmetrical but not spherical shapes found for catalase and legumin would have an undetermined effect on the frictional ratio, but could scarcely give values as high as those actually found The loose open structures proposed for thyroglobulin, urease and albumin might, however, have high frictional ratios But in the case of γ-globulin a perfectly spherical form behaves as an ellipsoid five times as long as it is wide , to account for this a hydration of almost 200 per cent would have to be proposed and this will generally be considered an impossibly high figure If one is not to conclude that frictional ratios bear little relation to shape and merely indicate the degree to which classical hydrodynamics is inapplicable to the molecules, only one alternative seems to remain It is possible, as Hall has suggested for fibrinogen[4], that the symmetrical objects seen with the electron microscope are only units of the molecule and are joined in pairs or trios by undetectable links Thus γ-globulin could possibly be a dumb-bell-shaped molecule with its spherical ends linked by perhaps a single protein chain that would remain unseen if less than 10 A wide Study has, however, so far quite failed to produce any evidence in favour of such pairing of units With all the proteins studied here, the electron microscope in fact suggests various almost symmetrical but not always spherical shapes

I am grateful to various colleagues, Dr A S McFarlane, Dr J R Tata and Dr. A C Allison, for samples of the purified proteins used in this work, to Dr P A Charlwood for ultra-centrifuge data on the macroglobulin and to Miss B Cooling for help with the electron microscopy

OBITUARY

Prof. C. T. R. Wilson, C.H., F.R.S.

At the time of his death, and in relation to date of election, Charles Thomson Rees Wilson was senior Fellow of the Royal Society by four years. He was elected to the fellowship in 1900, and, indeed, of those elected in the decade 1900–10, only three survive him. He received the Hughes Medal in 1911, a Royal Medal in 1922, and the Copley Medal in 1935. Eight years previously he had shared the Nobel Prize for Physics with A. H. Compton. This bare recital of fact tends to obscure the man in the record of history: it closes in the year which followed his retirement from the Jacksonian professorship at Cambridge, and his return to Edinburgh—and Scotland. It obscures C. T. R. the man, who endured, until the end, bright-eyed, nervously alert, long of stride, young of heart, serene through a quarter of a century of conflict and change which passed him by.

His years of retirement were not empty. Soon after his eightieth birthday, he moved from Edinburgh to the village of Carlops, close to his birthplace at the farmhouse of Crosshouse, at Glencorse; but regularly thereafter he made the journey to the city by bus so that he might lunch with friends, physicists and others, many of half his age or younger, once a week in a crowded restaurant. Scientifically, too, his retirement was fruitful: some four or five years ago he began again to write the long-promised account of his theory of thundercloud electricity, and finally, on April 27, 1956, the manuscript was lodged with the Royal Society. It was published in the *Proceedings* in August of the same year: twenty pages of closely reasoned statement—emphatically a work of the present, not of the past. Nor was he home-bound: he attended a dinner in his old college at the time of his eightieth birthday and, when the reactor *Dido* was inaugurated at Harwell in November 1956, he was among the guests. It was my privilege to be his travelling companion on that November day. Rising about 5.30 a.m., he was in Edinburgh soon after seven; we made the return journey to London Airport by B.E.A. *Viscount*; it was nearly 11 p.m. before he was home again. In the meantime, everything that there was to be seen he had seen; he had climbed all the ladders and looked into all the peep-holes; there had been a diffusion cloud-chamber working, and he had seen that too. He was delighted. Only one discontent clouded his joy. Travel by civilian air-liner was not overmuch to his liking. His preference was for the rigours and the excitement of the ancient *Anson* of the weather flight, in which he was flying as a student whenever occasion offered, an honorary member of the meteorology class of the University of Edinburgh. Such flights were a recurring delight of his last years, taking him to the north-west, over the outer isles, in fine weather and foul.

C. T. R. lived to become a legend: for me he was already legendary nearly forty years ago. The headmaster of my Yorkshire grammar school had been head of the science side at Bradford in the 1890's, and there, for a brief spell, C. T. R. had endeavoured to instruct the young, soon after he had graduated at Cambridge in 1892. In later years, when he had retired from Bridlington, Arthur Thornton reminded the authorities of his former school of a forgotten episode of its history, how for a little while it had numbered among its staff a future Nobel prizeman—and had not known his worth.

Wilson's father died when he was four years old. Thereafter his mother moved to Manchester, and C. T. R., intending to become a doctor, entered Owens College to study biology. Balfour Stewart (an Edinburgh man) was professor of physics at the time. A dozen years previously, or thereby, J. J. Thomson had passed through his class on his way to Cambridge. C. T. R. went on to Cambridge, also to Sidney Sussex College, with an entrance scholarship. Not until then did his interest veer to the physical sciences; but once the decision had been taken, that he should abandon medicine, there was no turning back. By the beginning of 1895 he had already started on what was to prove his major work. It was an unlikely beginning for a fundamental research, yet, after thirty years, it was to fill the physical laboratories of the world with an apparatus which, for a generation, did more to speed the progress of experimental physics than any other agency.

In 1895, Wilson was merely attempting "to imitate in the laboratory" the 'glories' which he had seen on the summit of Ben Nevis in the late summer of the previous year. But he had a sharp eye, and a keen mind, and he had been working for no more than a few months before his interest became engaged in the few drops which reappeared time after time continually, as often as he chose to expand a volume of moist, dust-free, air by more than a 5 : 4 ratio. He seized the significant conclusion that in such circumstances condensation nuclei must be being produced continuously throughout the sample of air. This observation could not have been made at a more opportune time—or in a more suitable place. In December 1895 news of Rontgen's discovery startled the world; towards the end of the following month, in Cambridge, Thomson and McClelland discovered the conductivity imparted to air by the passage of X-rays. Old knowledge concerning the slight 'residual' conductivity of the atmosphere now began to fit into place, and it was with 'delight', but scarcely, one imagines, with surprise, that Wilson found his 'rain-like' condensation enormously increased when he exposed his primitive cloud chamber to the new rays. This was in February 1896. The hypothesis that the conductivity was due to gaseous ionization was firmly established by Thomson and Rutherford during the summer of that year. Thereafter no one doubted that gaseous ions could be fixed in this manner—by condensing water vapour on them, through the process of adiabatic expansion.

Characteristically, Wilson did not himself become involved, at that time, in the excitement of the new investigations into the other properties of X-rays or of the Becquerel radiation. Instead, he carried out a full investigation of the details of the condensation phenomenon and with simple apparatus, but sure insight, a thorough study of the residual ionization in air and other gases. Then, in the early years of the century, he turned to different problems, and an increasing load of advanced teaching came to occupy his time. In 1910 a second phase of interest in the cloud apparatus followed, and early in 1911, for the first time, the tracks of individual α-particles and electrons were seen and photographed. The paths of the α-particles were just as W. H. Bragg had drawn them, five years previously, and the tracks of the electrons "little wisps and threads of clouds". This achievement was widely—and justly—acclaimed but, strangely, the literature of the period provides little evidence that others elsewhere sought to emulate Wilson's success.

The situation was entirely different after the third phase of Wilson's own interest. By 1923 he had finally brought to perfection this most remarkable method of experiment. The photographs of electron tracks with which he illustrated two classic papers published in that year were of such quality—and beauty—that the cloud chamber could no longer be dismissed as an amusing toy. All over the civilized world workers built themselves the necessary equipment. In Cambridge, Blackett and Kapitza; in Paris, Irène Curie and Auger; in Berlin, Bothe and Meitner and Philipp; Skobelzyn in Leningrad; Kikuchi in Tokyo—all within a very few years were operating Wilson cloud chambers with signal success. This was but the beginning of the story, and it is pointless here to continue it. Whoever turns the pages of a physical journal of the past thirty years will see for himself something of what the harvest has been: he will appreciate the abundance of it even more clearly if he turns the pages of "An Atlas of Typical Expansion Chamber Photographs" (1954), with its dedication to "C. T. R. Wilson, whose invention of the cloud chamber made these photographs possible", and its frontispiece reproducing his portrait by James Gunn. There could be no better *Festschrift*.

Wilson gave to physicists in general a sharp tool for research, second to none. By contrast, he gave to very few of them his personal guidance, as director of their individual researches: to Wormell, in the general field of atmospheric electricity (in this notice Wilson's contributions to this field have no more than been hinted); to Powell and Dee and J. G. Wilson in cloud-chamber studies; so the list is almost complete. Too much must not be made of this distinction: whether he be of the select few, or of the many, every physicist who has ever operated a cloud chamber must acknowledge his debt. It cannot be measured in words.

C. T. R. Wilson was born on February 14, 1869. He died on November 15 in the midst of his family. Mrs. Wilson, his son and two daughters survive him.

NORMAN FEATHER

NEWS and VIEWS

British Ceramic Research Association:

Dr. A. T. Green, C.B.E.

DR. A. T. GREEN retires from the directorship of the British Ceramic Research Association on December 31, after thirty-eight years service to the ceramic industry, during which time he has established himself as one of the world's leading ceramists. An old boy of Hanley High School, he joined Dr. Mellor at the British Refractories Research Association after the end of the First World War and quickly became associated with work on refractories for the steel and gas industries, and by his incisive attack on the problems he then encountered he laid the foundation for future developments, the benefits of which are still being reflected in the economics of those industries. He was made assistant director in 1931 and succeeded to the directorship on Dr. Mellor's retirement in 1937. After the Second World War, Dr. Green, who had been made O.B.E. for his contribution to the war effort, was charged with the task of uniting the British Refractories Research Association and the British Pottery Research Association to form the British Ceramic Research Association, and he took up the directorship in 1947. The Association's main laboratories in Queens Road, Penkhull, opened in 1951 by the Duke of Edinburgh, were planned under Dr. Green's direction, and the steady output of research papers—more than 400 have been published since 1948—is a tribute to the inspiration with which he has led his team of research workers. Dr. Green has been able to see, before his retirement, the completion of another laboratory block—to be named the Mellor-Green Laboratories—which is to serve the structural clay products branch of the ceramic industry. Dr. Green was made C.B.E. in 1957, and was awarded the degree of D.Sc. *honoris causa* by the University of Leeds in 1949. He is an honorary member of the Institute of Gas Engineers and of the British Ceramic Society, the latter he has served as honorary general secretary for the past twelve years. He was one of the founders of the Institute of Ceramics and was its first president.

Dr. N. F. Astbury

DR. N. F. ASTBURY, who has been deputy director since 1957, will succeed Dr. Green. Dr. Astbury was a scholar of St. John's College, Cambridge, where he obtained first-class honours in both parts of the Natural Sciences Tripos. After leaving Cambridge, Dr. Astbury was for ten years on the staff of the National Physical Laboratory, and at the outbreak of war went to the Anti-Submarine Experimental Establishment. In 1945, he entered industry to become director of research of the firm of Joseph Sankey and Son, Ltd., and then director of research to the Guest Keen Nettlefold Group of Companies, of which Sankeys is a member firm. During this time Dr. Astbury planned the central research laboratory for the group, which has now been established in Wolverhampton for ten years. Since 1949 Dr. Astbury has held two professorships—one, the chair of applied physics in the University of New South Wales and the other in the University of Khartoum, where he was also dean of the Faculty of Science. For a short time before joining the British Ceramic Research Association he was at the Royal Aircraft Establishment, Farnborough. Dr. Astbury was awarded his Sc.D. by the University of Cambridge in 1954. He serves on the Education and Membership Committee of the Institute of Physics and on the Advisory Board of the *Journal of Scientific Instruments* and the *British Journal of Applied Physics*, and he is also a member of the Board of Studies of the National Council for Technological Awards.

Deputy Director of the National Physical Laboratory Dr G Macfarlane

Dr George Macfarlane, a deputy chief scientific officer at the Royal Radar Establishment, Malvern, has been appointed deputy director of the National Physical Laboratory He succeeds Dr Edward Lee, who has occupied the post since March 1958 (see *Nature*, 181, 600 , 1958), and who now becomes director of the Stations and Industry Divisions at the headquarters of the Department of Scientific and Industrial Research

Dr Macfarlane, who is forty-three, graduated with first-class honours in electrical engineering at the University of Glasgow in 1937, and went on to do two years postgraduate research at Dresden, where he gained the Dr Ing degree in 1939 He joined the Telecommunications Research Establishment (now incorporated in the Royal Radar Establishment) in 1939 Throughout the war years he concentrated on mathematical problems in radar and microwave physics In 1945, he became head of the Mathematical Group, and a year later took charge of the Theoretical Physics Division Since 1953 he has been carrying out individual research in the Physics Department of the Establishment

European Organization for Nuclear Research, Cern

In the fourteenth session of the Cern Council which was held in Geneva on December 2 it was proposed that international co-operation should be developed in the field of high-energy accelerators such as those constructed at the European Centre for Nuclear Research in Geneva The contributions of the Member States have undergone some modification as a result of the accession of Austria to Cern and of changes in the national incomes

Country	1960-62 (%)	1957-59 (%)
Austria	1 93	—
Belgium	4 15	4 89
Denmark	1 99	2 23
France	21 22	22 26
German Federal Republic	19 52	18 27
Greece	1 17	1·08
Italy	10 09	10 61
Netherlands	3 85	3 78
Norway	1 61	1 72
Sweden	4 23	4 85
Switzerland	3 29	3 48
United Kingdom	25 00	25 00
Yugoslavia	1 95	1 83
	100	100

The Council approved contributions from the thirteen member States totalling 65,000,000 Swiss francs for 1960 This compares with a budget of 55,000,000 Swiss francs for 1959 Of the 1960 expenditure, 38,500,000 Swiss francs are earmarked for capital expenses, of which 15,000,000 Swiss francs are for new buildings and general site facilities, and 18,000,000 Swiss francs for auxiliary experimental equipment The remaining 26,500,000 Swiss francs will cover general staff and operating expenditure

The following appointments were announced F de Rose (France) and Prof W Heisenberg (Germany) and J Willems (Belgium) were re-elected respectively president and vice-presidents of the Council J H Bannier (Netherlands) was re-elected chairman of the Finance Committee Prof F Perrin (France) takes the place of Prof H Alfvén (Sweden) on the Scientific Policy Committee

Reactor Project at Halden

The second fuel charge for the Organization for European Economic Co-operation Boiling Heavy Water Reactor Project at Halden, Norway, has been ordered by the Norwegian Institutt for Atomenergi from A B Atomenergi of Sweden The order is worth approximately 500,000 dollars The Halden reactor, which is one of the two experimental reactors in the current programme of the Organization's European Nuclear Energy Agency, has been in operation at zero power since last June using a fuel charge of natural uranium metal With this charge, to which it is intended to add a certain number of slightly enriched uranium 'spikes', a maximum power of approximately 5 MW is expected The second fuel charge will consist of approximately 1,500 kgm of 1 5 per cent enriched uranium oxide, made up into 100 7-element assemblies of zircalloy-clad rods This charge is expected to enable powers up to 20 MW to be obtained Delivery of the second charge will be in March 1961, and will include eight extra fuel assemblies, without uranium, for experimental use in the reactor core

Mental Health Problems in Old Age

A new report issued by the World Health Organization (Technical Report Series, No 171. Geneva W H O , London H M Stationery Office *3s 6d*) deals with some of the psychological and social problems posed by the ageing of populations It is the work of a small expert committee which met in Geneva last year to consider the broad psychiatric implications of present population trends In its report, the committee stresses particularly the need for integrated mental health services for the aged which would provide guidance as well as medical care Emphasis is also placed on the need for fundamental research on the psychological assets and disabilities of older people Although this report deals principally with the strictly psychiatric aspects of old age, it deserves careful study by all concerned with the biology of ageing and the care and management of the elderly

Friends of the Lake District

The annual report of the Friends of the Lake District reviews the work of the association since it was founded twenty-five years ago So long ago as 1936 an agreement was reached with the Forestry Commission not to acquire for afforestation any land within the central 300 square miles of the Lake District In 1937 the first proposals for making the Lake District into a national park were put forward, while, in 1937, the association persuaded the Westmorland and District Electricity Co to modify its plans about overhead electricity lines and to put them underground By 1938 membership of the society had reached 2,700 In the same year, a road policy for the Lake District was produced, the society supporting a case against the making-up as motor roads of the remoter mountain passes and urging restraint against the up-grading of Lake District roads generally At about this time measures were first taken to protect the rarer birds which nest in the high fells This work has continued over the years with beneficial effects The society has also taken vigorous action to prevent the silting and discoloration of Ullswater by effluent from the Glenridding lead mine Other matters in this interesting report include accounts of the measures taken to mitigate the effects of war training areas, control of war-time factories, and the building of reservoirs by local authorities The report (Friends of the Lake District 1934–1959 Retrospect and Annual Report, June 1959 Pp 30) may be obtained from the Secretary, 14 Princes Street, Ulverston, Lancs

Freshwater Biological Association

THE now familiar style of the yearly report of the Freshwater Biological Association should be taken as a model of the way in which reports of scientific associations could be presented (Freshwater Biological Association Twenty-seventh Annual Report for the year ended March 31, 1959 Pp 81 (Ambleside Freshwater Biological Association, 1959) 4*s*) Although brief, it gives details of the administrative work of the Association during the year, a statement of its finances, a description of the staffing position, as well as a clear account of the scientific work carried out by the staff during the year supported by a list of all papers submitted by them to learned societies and journals The presentation should be of particular value to lay members of water boards throughout the country Among interesting scientific work was that by Dr Talling on the photosynthetic behaviour of plankton algae, considered in relation to the problems of primary production in lakes Particular attention has been given to the variation of photosynthesis rate with depth, a fundamental relation in calculations of photosynthetic productivity below unit area In the course of work by Dr Willoughby on the distribution of the lower saprophytic fungi (Chytridiales and Blastocladiales) of Esthwaite water, a species of *Blastocladiella* has appeared repeatedly in baitings from the marginal zone The group Blastocladiales is one which has excited a great deal of interest especially in America, but no member of either of the two most important genera, *Allomyces* and *Blastocladiella,* had ever been recorded before in Britain, and no *Blastocladiella* had been reported from Europe The species found in Esthwaite occurred on all three types of bait used, cellulose, chitin and keratin, and its ability to grow on all three has been verified in cultures grown from a single spore Unlike *B emersonii* Cantino, it does not respond to treatment with bicarbonate by producing resting spores The report is available from the Secretary, The Ferry House, Far Sawrey, Ambleside, Westmorland

The Institution of Mining Engineers

IT is announced that Mr R G Baker has been elected president for the year 1960–61 in succession to Mr T A Rogers Ir A Hellemans (director, Staatsmijnen in Limburg) and Dr J Taylor have been elected honorary members of the Institution The tenth award of the Douglas Hay Medal, instituted in 1950 in memory of the late Prof D Hay, past-president, has been made to Mr A E Crook in recognition of his valuable contributions to engineering practice in mining with special reference to haulage and winding and for his papers on these subjects in the *Transactions* The Maskell Peace Scholarship of £70 for 1959, the tenth since the Institution accepted the trusteeship of the fund from the Mining Association of Great Britain, has been awarded by the North of England Institute of Mining and Mechanical Engineers to Mr P Hutchinson, a student at the Department of Mining Engineering, King's College, University of Durham

Trevelyan Scholarships

THE first awards of these scholarships were made in 1958 and the second awards have now been made by the Trust The scheme is sponsored by the following companies Arthur Guinness Son and Co , Ltd , Associated Electrical Industries, Ltd , Courtaulds, Ltd , English Electric Co , Ltd , Guest Keen and Nettlefolds, Ltd , Imperial Tobacco Co , Ltd , John Summers and Sons, Ltd , Peninsular and Oriental Steam Navigation Co , Rolls-Royce, Ltd , Steel Company of Wales, Ltd , Stewarts and Lloyds, Ltd , and the United Steel Companies, Ltd Sufficient funds have been subscribed to permit the award each year of not less than 34 three-year scholarships of £450 a year over a period of five years It was arranged that all applications would first be considered at either Oxford or Cambridge, according to the applicants' first choice, the University panels agreeing upon 'short lists' of candidates for final interview by a selection committee For the second selection 198 applications were accepted, and from these a short list of 58 applicants were interviewed In 1958, 123 applications were accepted and 54 applicants were interviewed The selection committee restricted the awards to 23 in number, of which 12 are tenable at Oxford and 11 at Cambridge In 1958, 19 awards were made 10 at Oxford and 9 at Cambridge

Announcements

COMMENCING January 9, a course of twelve lectures and appropriate practical work on micro- and semimicrochemical methods will be held on Saturday mornings at the Norwood Technical College, London, S E 27 This course has been arranged for teachers, industrial and research chemists, and is designed to survey the principal branches of chemistry in which small-scale methods have been successfully applied Further information can be obtained from the secretary of the College

THE Bradford Institute of Technology has announced that it is holding a symposium on "Recent Developments in Textile Chemistry" and also a short course in "New Techniques in High Polymer Chemistry" The symposium is to be held on February 13 in conjunction with the Bradford Chemical Society and the Yorkshire Council for Further Education The course is to take place during February 26–27 Both are to be held at the Bradford Institute of Technology Further information can be obtained from the Registrar, Institute of Technology, Bradford 7

THE Association of Agriculture has announced that a series of eight evening lectures, the third in its kind to be organized in collaboration with the Extra-Mural Department of the University of London, will be held during January 20–March 9, 1960 The series, "The Land of Britain, is it used to the Best Agricultural Advantage ?", will take place at the London School of Hygiene and Tropical Medicine, Keppel St , London, W C 1 Further information can be obtained from the General Secretary, The Association of Agriculture, 53 Victoria St , London, S W 1

ERRATUM The authors of the communication entitled "Mineral Uptake and Retention in Cottongrass (*Eriophorum vaginatum* L)" published in *Nature* of August 8, p 467, state that the ordinate of Fig 1 was incorrectly printed by them , for "m eq " read "gm "

THE BRITISH COTTON INDUSTRY RESEARCH ASSOCIATION

OPEN DAYS AT THE SHIRLEY INSTITUTE

THE fortieth annual general meeting of the British Cotton Industry Research Association was held at the Shirley Institute on October 22, with the chairman of the Association, Mr N G McCulloch, presiding In his address Mr McCulloch said that he wished to reiterate a view that he had many times expressed, that there was an urgent need in the Lancashire textile industry for a much more concentrated and sustained study of the subject of organization and management than had so far been attempted The Shirley Institute was no stranger to this field of work and had made a number of worthy contributions, but the effort needed intensifying and widening Mr McCulloch also referred to the working party which had been set up to consider the problems involved in the proposed fusion of the Institute with the British Rayon Research Association, and emphasized the importance of this latest move towards rationalizing co-operative research for the Lancashire textile industry

Mr J Lindley, honorary treasurer, in reviewing the statement of accounts for the year, was particularly concerned to emphasize the need for adequate reserves, since expenditure on research could not be turned either off or on like a tap He pointed out that the general reserves at present were in fact only sufficient to pay the Association's outgoings for rather less than nine months

At the end of the meeting, Mr McCulloch announced his forthcoming resignation and tributes were paid both by Mr Lindley and from the floor of the meeting to his great contribution as chairman for the past ten years

Dr D W Hill, director of research, then presented his report on the year's work and stressed the consideration which had been given during the year to the need for a research association to follow up its research work with all possible steps to ensure application in mills and works This was a particular concern of the Institute during the industry's difficult times, and it was reflected, for example, by an increase of 14 per cent in technical inquiries received by the Institute during the preceding year There was also a need to keep abreast of industrial advances in foreign countries, to which end four teams had been sent to the Continent to visit Holland, Italy, France and Western Germany and to report their experiences to members

In selecting a few research and development topics for special comment, Dr Hill mentioned the continuing work for spinners on control of regularity of their intermediate products, and referred to the success of the cop sorting device for condenser spinners A new programme of work was now starting on winding and beaming, with particular emphasis on the variations in the density of various wound packages Results of interest to both spinners and weavers should follow the introduction of a new technique involving the use of a radioactive isotope within the package The work on sizing continued and attention had been paid to, and a device developed for, reducing the hairiness of yarns, particularly those of synthetic fibres Work on the dry-feed attachment of the automatic size box had reached the point of initiating mill trials It was impossible, with the limited resources available, to do simultaneous research on all the widely diverse problems of the industry, and it had been decided to devote attention at intervals to the smaller and more specialized sections At the moment, for example, a fundamental study of the operation of a terry-towel loom was being started

On the chemical side, Dr Hill directed particular attention to past history of work at the Institute on bleaching processes, work which had been recently brought up to date by a thorough examination of the mechanism of sodium chlorite as a bleaching agent, which had also produced very valuable technological results Also for finishers, Dr Hill reported that a long-term physical study of the action of the raising machine had resulted in the introduction of a new kind of instrumentation in this process which should be of great technical benefit

As in previous years, the Institute laboratories were open for inspection for two days, when all members of staff were available for consultation

Spinners were particularly interested in an automatic nep counter, so far only used for research purposes, in which a photoelectric method is used for detecting neps, followed by an electronic counter A new version of the Shirley opener was also shown, as was a recent further improvement to the pressure-point system

In the Weaving Department a large exhibit attracted the attention of members to the widely varied services the Institute could offer them, while another exhibit analysed the major causes of warp breaks during weaving A stretch regulator, the Shirley loom and the new device for reducing hairiness were also operating Most interest in this section, however, was raised by the exhibit showing the range of, and methods used in the investigation being carried out on yarn clearing

Finishers were given working demonstrations of the flash steamer now commercially available and of the new raising action indicator A highly important new programme is that on washing efficiency, with the high cost of water and the expense of effluent disposal becoming increasingly serious Preliminary results already suggest that there will be considerable gains from working in this field

Fundamental work on the mechanism of the burning of cellulose has started and there were demonstrations both of the production of inflammable tars as intermediate products, and also of the behaviour of existing flame-proofing agents The use of infra-red absorption analysis for identification of finishes and contaminants was interesting both fundamentally and as an aid to the technologists

The Institute continues its fundamental investigation of the effect on yarn and fabric properties of blending natural and synthetic fibres, and a general display showed the extent to which it is now possible to forecast many of these properties from a previous knowledge of fibre properties

Old and new instruments were in evidence both for research and control purposes As usual, there was a stand showing the instruments being handled by Shirley Developments, Ltd., which, as a result of rapid growth, now shows in its catalogue 30 instruments and 30 mechanical devices.

New instruments for research purposes included a new photomicrographic apparatus designed and made at the Institute, and also a polarizing lustre meter with which it is hoped to interpret how the eye judges lustre.

It was encouraging that a large proportion of the visitors on the open days came with the definite object in mind of seeing how the Institute's work made an impact on their own mill or works.

AGRICULTURAL INSTITUTE OF THE REPUBLIC OF IRELAND

DIVISION OF PLANT SCIENCES AND CROP HUSBANDRY

THE establishment, under the Agricultural (An Foras Talúntais) Act, 1958, of the Agricultural Institute of the Republic of Ireland, An Foras Talúntais, was announced in *Nature*, July 4, 1959. The Institute now announces major developments in the organization of the Division of Plant Sciences and Crop Husbandry. This will provide a wide coverage in the plant sciences field, catering for research in plant pathology, entomology (including nematology), plant breeding, plant protection, plant quality, weed control, and other general aspects of crop husbandry.

Mr. B. Crombie, at present in charge of the Plant Breeding Station of Cómhlucht Siúicre Éireann, Teo. (Irish Sugar Company), at Thurles, Co. Tipperary, has been appointed chief of this Division. Mr. Crombie, a native of Offaly, gained his B.Agr.Sc. degree with honours at the National University of Ireland in 1934 and was awarded a postgraduate scholarship. In 1937 he gained his M.Sc. degree for a thesis on "The Influence of Various Factors on the Time of Ripening of Wheat Varieties". While working under Prof. M. Caffrey, University College, Dublin, Mr. Crombie was responsible for the breeding of the well-known Glasnevin strains of perennial ryegrass and cocksfoot. He had been responsible for the organization of seed-breeding research and developments with Cómhlucht Siúicre Éireann, Teo., giving to the industry sugar-beet seeds of top quality. Mr. Crombie has published papers dealing with his research work in a number of scientific journals. He comes to his new post with a high reputation not only in plant breeding but also in plant science and crop-husbandry work in general.

By mutual agreement between the Council of An Foras Talúntais and the Industrial Research Committee of the Institute for Industrial Research and Standards, the facilities and equipment of the Cereals Laboratory at the latter Institute have been made available to An Foras Talúntais. This laboratory will devote special attention to the question of baking quality in wheat in relation to soil, manurial, climatic, varietal and cultural conditions, while in addition undertaking research on quality in other cereals. The general supervision of this laboratory for An Foras Talúntais will be in the hands of the director of the Institute for Industrial Research and Standards, Mr. D. T. Flood. Mr. P. A. Spillane has been appointed a senior research officer on the staff of An Foras Talúntais and will be head of the laboratory. Other appointments to this Unit are those of Miss H. McGovern as research officer and Misses K. McGrath and E. Cooper as technicians. Mr. Spillane graduated from University College, Dublin, with honours in physics and chemistry in 1936. He has a wide experience of research and general operational work in the flour-milling industry and is the author of a number of scientific papers dealing with this work.

It has been agreed in principle between the Board of Cómhlucht Siúicre Éireann, Teo., and the Council of An Foras Talúntais that the sugar-beet breeding research facilities at Thurles and the Nematology Laboratory at Carlow of the Irish Sugar Company will be integrated with An Foras Talúntais. These centres have already been placed under the scientific direction of An Foras Talúntais pending the conclusion of arrangements by the staffs of the organizations concerned. This arrangement places at the disposal of the Agricultural Institute the scientific staff and extensive offices, laboratory and greenhouse facilities and equipment which have been developed at these centres over a number of years. While the sugar-beet seed research programme will be continued and expanded at Thurles by An Foras Talúntais on behalf of Cómhlucht Siúicre Éireann, Teo., this centre will also act as headquarters of the Division, with the resulting development of research services in general plant science work apart from those needed for sugar-beet research.

The nematology laboratory at Carlow which provides well-developed facilities for this sphere of research will also be used in the general research programme of the Institute. Dr. J. J. Duggan has been appointed senior research officer in charge of the Nematology Unit of the Institute now located at University College, Dublin. Dr. Duggan is well known for his research work in nematology on which he has published a number of scientific papers, and the Unit at Carlow is now under his scientific direction.

A Plant Pathology Unit has been established. Dr. J. B. Loughnane, Department of Plant Pathology, University College, Dublin, is acting as adviser for this aspect of the activities of the Institute. Mr. P. Cunningham and Mr. C. Comerford are now working under Dr. Loughnane in the Plant Pathology Unit, while Mr. T. E. Mulligan, previously on the staff of the Rothamsted Experimental Station, joined the staff of the Unit on October 1. Associated Seed Growers, Ltd., have generously offered a grant for the investigation of the diseases of a number of crops such as kale and mangels. This offer has been accepted by the Council of the Institute and investigations are already under way.

Arrangements are also being completed for placing an Applied Plant Genetics Research Unit at the Kells Ingram Farm of the University of Dublin, working under the general direction of Mr. G. W. P. Dawson, head of the new Department of Genetics, Trinity College, Dublin. This Unit will deal with some of the more practical aspects of plant genetics. Mr. V. Connolly has been appointed research officer in this Division. Arrangements are proceeding with the organization of the other departments of the Division, and it is hoped to have a full research programme under way during the coming year.

ELECTROPHORESIS OF HUMAN GASTRIC JUICE

By Dr. RAGNHILD GULLBERG and Dr. BÖRJE OLHAGEN
Konung Gustaf V:s Forskningsinstitut, Stockholm 60

ANALYSIS of the macromolecular components of gastric juice has hitherto given varying results not readily comparable[1-5]. This is in all likelihood due to defective control of autodigestion. The proteolytic effect of the pepsin is so rapid at the low hydrogen ion concentration generally prevailing in normal gastric juice that it is not sufficient to neutralize the juice immediately after aspiration. For that reason, we attempted to neutralize the gastric juice already in the stomach by introducing sodium phosphate buffer.

The gastric juice was collected as a fasting secretion or after insulin stimulation. A suction device prevented the admixture of saliva. Samples contaminated with blood or bile were discarded. The juice collected was cooled immediately on ice and treated continuously in the cold. Visible mucus was eliminated by centrifugation or filtration through glass wool. The juice was concentrated by ultrafiltration through collodion membrane. Paper electrophoresis was performed according to Glass *et al.*[1] in borate buffer at a *p*H of 9·0.

Gastric juice which had been neutralized in the stomach with sodium phosphate buffer of varying *p*H and ionic strength 0·2 was compared with further samples from the same individual, one neutralized immediately after aspiration and another not neutralized. In addition, juice that had been neutralized in the stomach was compared with portions of the same sample which after neutralization had been acidified with 0·1 *N* hydrochloric acid to varying *p*H levels at different temperatures and for varying periods and then again neutralized.

Three main components were found to stain with amido black in 20 human gastric juice samples neutralized in the stomach (Fig. 1). The most rapidly

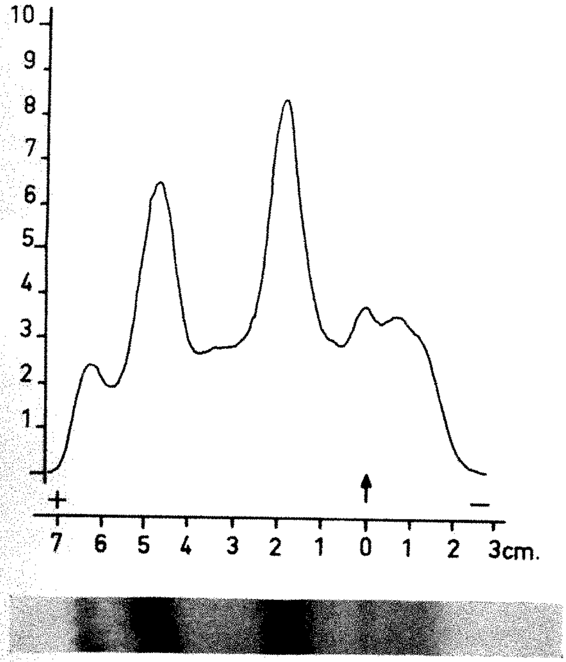

Fig. 1. Paper electropherogram of normal gastric juice neutralized in the stomach with sodium phosphate buffer to *p*H 7·2. Amido black stain

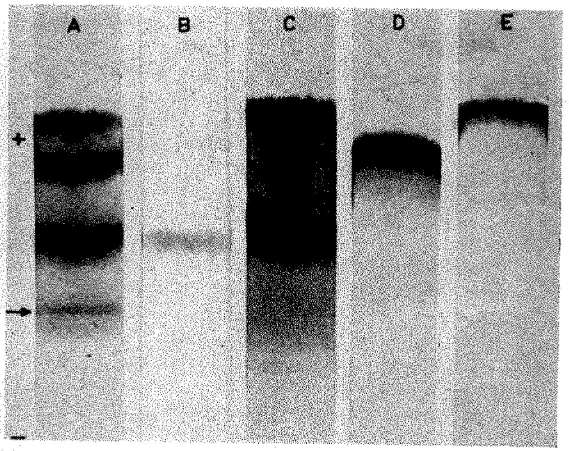

Fig. 2. Electropherograms. *A* and *B*, gastric juice neutralized in the stomach, stained with amido black and periodic acid–Schiff respectively; *C*, same juice aspirated after neutralization in the stomach and acidified with 0·1 *N* hydrochloric acid for 5 min. at 24° C. (*p*H 1–2); *D*, human serum albumin; *E*, crystalline pepsin

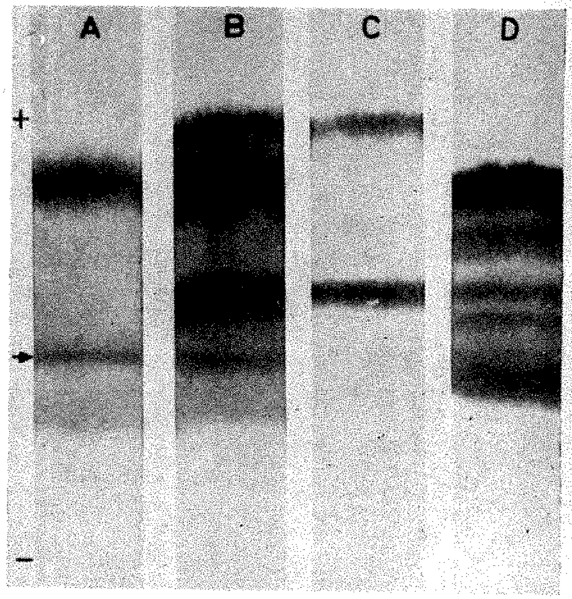

Fig. 3. Electropherograms. Amido black stain. *A*, fasting secretion, *p*H 6. The pepsin band is missing; *B*, gastric juice from the same individual after insulin stimulation, neutralized in the stomach to *p*H 7·2; *C*, juice from the same individual, not neutralized, *p*H 1–2—the albumin is missing; *D*, serum pattern, borate buffer *p*H 9·0

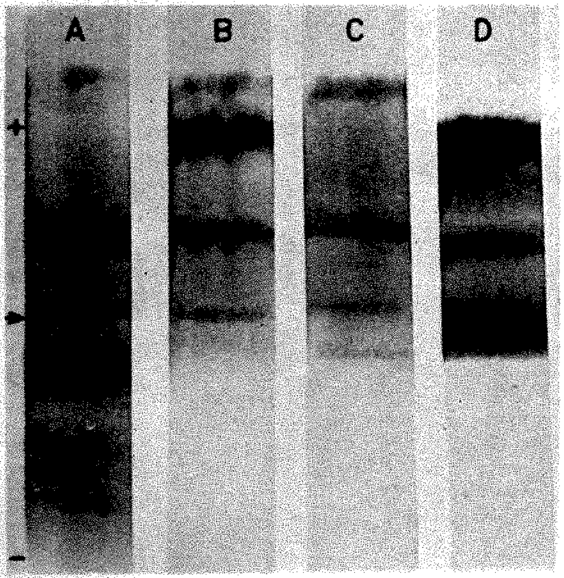

Fig. 4. Electropherograms. Amido black stain. *A*, fasting secretion, not neutralized, pH 2–3; *B*, gastric juice from same individual, neutralized in the stomach to pH 7·2; *C*, same juice aspirated after neutralization in the stomach and acidified with 0·1 *N* hydrochloric acid for 2 min. at 24° C. (pH 1–2)—disappearance of the albumin band; *D*, serum pattern, borate buffer pH 9·0

anodically migrating component has the same mobility as crystalline pepsin (Fig. 2*E*) and has earlier been shown to be a carrier of peptic activity[1]. It is not present in gastric juice from achylia patients (Fig. 5*A*) or in non-acid fasting secretion (Fig. 3*A*); it is occasionally absent in juice which has been neutralized in the stomach to pH 8·0, and is in any event less readily stained than when the juice is neutralized to a pH of 7·2.

The mobility of the second component corresponds to that of pure serum albumin (Fig. 2*D*). This fraction is invariably present also in gastric juice from achylia patients (Fig. 5*A*), while it is absent or found in only small amounts in acid juice not neutralized in the stomach (Figs. 3*C*, 4*A*) and in juice neutralized in the stomach and afterwards acidified (Figs. 2*C*, 4*C*). It persists after acidification of achylia juice to pH 1–2. Gel diffusion analysis according to Ouchterlony[6] exhibited a heavy immunoprecipitate against anti-albumin serum. It is of interest that even normal human gastric juice contains a protein component which seems to be identical with serum albumin, especially in view of recent studies which have shown a leakage of large amounts of albumin into the stomach in so-called idiopathic hypoproteinæmia[2,7].

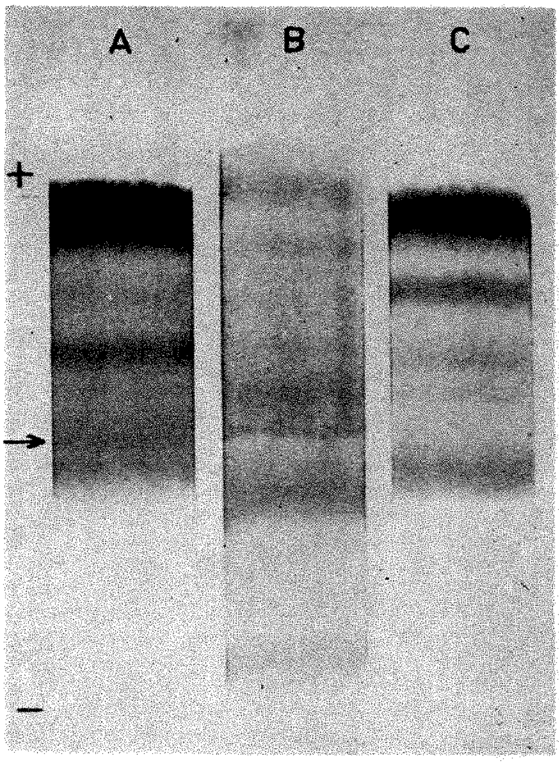

Fig. 5. *A*, Achylia gastric juice; *B*, same juice incubated at 37° C. with crystalline pepsin at pH 1–2 for about 5 min.; *C*, serum pattern, borate buffer pH 9·0

The third component shows a high carbohydrate content with periodic acid–Schiff staining and may, accordingly, represent a mucoprotein complex (Fig. 2*B*).

Acid gastric juice not neutralized in the stomach contains from 2 (Fig. 3*C*) to 8 components, some of which are strongly basic and appear on the cathodic side of the paper strip (Fig. 4*A*). A similar electrophoretic pattern is found in achylia gastric juice incubated with pepsin at a low pH (Fig. 5*B*). Our investigation would indicate that the majority of the many fractions usually found in acid gastric juice, not neutralized in the stomach before aspiration, are breakdown products.

ECOLOGY OF ACRANIATE LARVÆ

By J. H. WICKSTEAD*
Singapore Regional Fisheries Research Station

AND

QUENTIN BONE
The Laboratory, Citadel Hill, Plymouth

LITTLE is known of the habits of acraniate larvæ; the evidence available is conflicting. Willey[1] stated that the larvæ of *Branchiostoma lanceolatum* (Pallas) were entirely planktonic until metamorphosis; van Wijhe[2] suggested that they lived chiefly upon the sea bottom; Webb[3] found that the larvæ of *B. nigeriense* Webb lived part of their life upon the sea bottom, and part in the upper water. It is, therefore, not certain whether the typical acraniate larva spends its life on or near the sea bottom, in the surface layers, or a part in either situation. Moreover, it seems that there may be two different types of larva in the group, each with its own ecology: the 'amphioxides' larva, living for a long period in the plankton and growing to a relatively large size, and the 'amphioxus' type of larva which is smaller, and living partially on the bottom. The 'amphioxides' larva appears to be characteristic of the Epigonichthyidae, the 'amphioxus', of the Branchiostomidae[4]. The present account records observations upon four species of acraniate larvæ found in the Indo-Malayan plankton, which give some indication of the habits of both types of larva, and which show that the 'amphioxides' larva is also found in the Branchiostomidae. These larvæ were taken during a plankton survey made by the Singapore Regional Fisheries Research Station; they occurred at 3 stations only (namely, Permanent Station No. 5; Station *C*3/17, and Station *C*6/18).

---

* Present address: The Laboratory, Citadel Hill, Plymouth.

Station No. 5. (Singapore Strait: 1° 14′ N., 103° 55′ E.) At this station diurnal vertical migration was investigated by taking 16 horizontal samples at four depths (surface, 27, 55 and 82 m.) throughout a year. At the last depth, the net was only 6 in. above the bottom. The samples were taken in full daylight, just before sunset, just after sunset and in darkness.

Acraniate larvæ were found regularly in these samples from the latter half of October up to January. They were at various stages in development; some individuals were metamorphosing. These larvæ had 10–21 gill slits and were 3·6–5·2 mm. long. A single juvenile 17·5 mm. long was also found. All belonged to *Branchiostoma belcheri* Gray. Webb[5] has recorded the adult from this area. Analysis of the samples showed that, while numbers of the larvæ were small, their behaviour was consistent. Fig. 1 illustrates the way in which the larvæ stay on, near, or possibly within the sea-bed during the day, and move upward at dusk, showing the largest concentration at the surface for a short period after sunset; afterwards they disperse. As a rule, the greatest numbers of larvæ were taken at night. Bedford[6] found larvæ in Singapore Strait at night only.

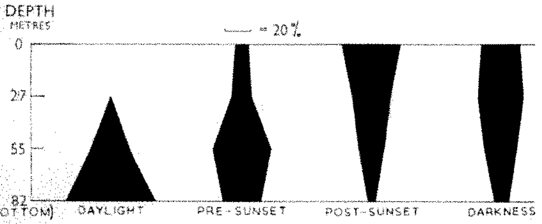

Fig. 1. Percentage vertical distribution of *Branchiostoma belcheri* larvæ

Webb[3] recorded vertical movements of *B. nigeriense* larvæ, and demonstrated experimentally that they reacted to temperature and salinity variations, these responses determining their position in the water layers. At Station No. 5, temperature and salinity variations with depth were negligible, and the larvæ were not being stimulated to move from unfavourable to favourable surroundings as Webb found with *B. nigeriense*. The possibility of passive swirling by up-currents can be discounted. The conclusion is that *B. belcheri* larvæ migrate actively upward through the water, reaching the surface as darkness falls. Twilight at Singapore is short, the two series of samples taken just before and just after sunset being only about 75 min. apart. From this, and the distances involved, it is estimated that the larvæ are capable of moving through a vertical distance of 35 m. in approximately 90 min., equivalent to 6·5 mm./sec.

The actuating stimulus for the migration is not known, but in view of Chin's[7] observations on larvæ of *B. belcheri*, it would appear to be light intensity.

The possibility that the migration is one where the larvæ move into areas richer in food is not suggested by examination of the gut contents. Of the guts examined, 5 (8 per cent) had no discernible food present; the remainder contained food particles in a mucous rope. The following diatom genera were identified: *Coscinodiscus*; *Pleurosigma*; *Nitzschia*; *Melosira*; *Achnanthus*; *Navicula*; *Rhizosolenia* and (?) *Cocconeis*. There were also silico-flagellate skeletons, what are probably small echinoderm spine fragments, and finely divided debris, both organic and inorganic. Most of the diatom genera are normally bottom dwelling; these formed the bulk of the food. No doubt frustules of the two genera *Coscinodiscus* and *Rhizosolenia* would form a natural part of the bottom detritus at this depth.

It seems then that the larvæ feed only when on the bottom; such an intermittent pattern of feeding has been inferred for larvæ of *B. lanceolatum*[8], the cycle taking at least 9 hr. to complete.

A study of the water movements of the area has shown that the diurnal migration would have the effect of distributing the species; it was Goldschmidt[9] who first suggested that each species of acraniate might possess the two types of larva known in the group, and that one would be distributory and pelagic (the 'amphioxides' larva), the other bottom-living; however, the larva of *B. belcheri* is not of the 'amphioxides' type.

Another result of the vertical movement would be the avoidance of nocturnal bottom-feeding predators, for example, penaeid prawns. Mr. D. N. F. Hall (personal communication) informs us that these animals find their food by 'grubbing around' on the bottom, and, although somewhat selective in their feeding habits, many are omnivorous and quite capable of including the larvæ in their diet. These prawns are sufficiently numerous to comb a large area of the sea-bed at night. No doubt other predators behave similarly.

There are other observations that acraniate larvæ of different species rise to the surface at night. Gibson[10] noted that more than three-quarters of his material had been taken at the surface by night. Recent catches of *B. lanceolatum* larvæ in the North Sea have been made at night and just after sunrise at the surface (Cattley, J. G., personal communication, 1957, and Williamson, M. H., personal communication, 1959). It seems, therefore, that the diurnal vertical migrations of *B. belcheri* larva at Station No. 5 are possibly characteristic of acraniate larvæ in general, the behaviour patterns described by Willey and by Webb for *B. lanceolatum* and *B. nigeriense* being perhaps referable to the special environments of each of the populations studied.

*Station C*3/17 (Malacca Strait: 7° 12′ N., 97° 12′ E.). A single sample was collected at this station between 2100 and 2115 hr. (sunset about 1845 hr.), at a depth of 1·5 m. Total depth was 1,005 m. (550 fathoms), the station being about 50 miles outside the 100-fathom line. Larvæ of two species were found; the majority belonged to *Branchiostoma malayana* Webb, but there were also a few of an 'amphioxides' type. The guts of the *B. malayana* larvæ were generally almost empty, but some larvæ had caught relatively large frustules of *Rhizosolenia* sp., which lay along the peripharyngeal bands and at the top of the branchial chamber More common were chain diatoms (probably *Bellerochea* sp), which were sometimes longer than half the entire branchial chamber One gut contained part of a single small crustacean limb appendage and a doubtful small crustacean antenna , these were not lying along the top of the branchial chamber Both forms of diatoms are normally pelagic, suggesting that these larvæ had been feeding in mid-water, and in any event, the depth of water over which the larvæ were caught does not suggest that they can have been feeding near the bottom From the position of the station, the depth of water and the gut contents of the larvæ, it appears that the 'amphioxus' type of larva of *B malayana* is truly pelagic, and that it does not spend the daylight hours upon the bottom as does the larva of *B belcheri* No metamorphosing individuals were found , the larvæ had 12–18 gill slits Only two adults of this species are known, both collected by one of us from the inter-tidal zone of south-east Singapore[5]

The amphioxides larvæ collected at this station belong to the Branchiostomidae, forming the second record of this type of larva from the family (Fuller[11]) They are of a different species from that discussed by Fuller, and will be described in a subsequent publication

Station C6/18 (800 miles E N E Singapore 6° 18′ 25″ N , 115° 36′ 50″ E) Only 3 acraniates were collected from this station, one a post-metamorphic *B belcheri*, the others amphioxides larvæ, probably belonging to *Amphioxides pelagicus* (Gunther), an entirely pelagic form and almost certainly the larva of *Asymmetron lucayanum* Andrews

Goldschmidt[12] stated that doubt remained because the form of the tail fin in his specimens of *A pelagicus* differed from that of the *Asymmetron* adults , it is interesting that the present larvæ show a tail fin more similar to the adult than did Goldschmidt's specimens

Station C6/18 was situated near a steeply shelving bottom in a depth of 64 m , so that it is not surprising that both pelagic and diurnally bottom-dwelling larvæ were found together

ENZYMIC ACTIVITIES OF HUMAN SKELETAL MUSCLE MITOCHONDRIA : A TOOL IN CLINICAL METABOLIC RESEARCH

By Dr. L ERNSTER, Dr. D IKKOS and Dr R LUFT

Wenner-Gren Institute, University of Stockholm, and Department of Endocrinology and Metabolism, Karolinska Sjukhuset, Stockholm

MITOCHONDRIA are the well-established site of cellular respiration and of those enzymic processes by which the energy liberated in terminal electron transport is conserved in the form of high-energy phosphate, notably adenosine triphosphate In intact mitochondria, respiration and the accompanying phosphorylation are coupled together in an obligatory manner, and this coupling is generally considered to constitute the level at which the metabolic rate of the animal organism as a whole is regulated In spite of the vast amount of experimental work with isolated mitochondria which underlies these concepts, relatively few studies are so far available on mitochondria from skeletal muscle, the largest tissue of the vertebrate body, and none, to our knowledge, on skeletal muscle mitochondria from human beings Considering the relative simplicity with which specimens of human skeletal muscle can be obtained by biopsy, such studies were felt to be of some interest, with potentialities of providing information of both biochemical and clinical significance

In the present work, some enzymic properties of normal human skeletal muscle mitochondria were investigated and compared with those of mitochondria from a choice of patients with elevated basal metabolic rates The following well-known characteristic properties of intact vertebrate mitochondria were considered their capacity to catalyse the aerobic oxidation of various Krebs cycle metabolites and glutamate[1] , to carry out oxidative phosphorylation[1] , to adjust their respiratory rate to the availability of a terminal phosphate acceptor[2], that is, to display so-called respiratory control , and to exhibit adenosine triphosphatase activity induced by 2,4-dinitrophenol[3]

For the present study, three cases of hypermetabolism were selected (1) a case of classical thyrotoxicosis of moderate degree (basal metabolic rate + 50 per cent) , (2) a patient with so-called thyrotoxicosis factitia, that is, a subject deliberately consuming large doses of thyroid hormone (basal metabolic rate + 50–80 per cent) , and (3) a patient with an extremely high basal metabolic rate (basal metabolic rate + 150– + 170 per cent) of unknown origin, with no demonstrable thyroid disorder , a detailed description of this unique case will be published elsewhere

Specimens of skeletal muscle from subjects with no evidence of metabolic disorder ('normal' subjects) were obtained in connexion with surgical interventions, and from the patients with hypermetabolism by biopsy In case 3, two biopsies were made, with an interval of sixteen days The form of anæsthesia, general or local, was shown to be of no significance for the mitochondrial properties studied here.

The mitochondria were isolated according to the well-documented procedure of Chappell and Perry[4], using a homogenizing medium containing 0 1 *M* potassium chloride, 0 05 *M tris*-(hydroxymethyl)-

aminomethane buffer, *p*H 7.4, 0.001 *M* sodium adenosine triphosphate, 0.005 *M* magnesium sulphate and 0.001 *M* ethylenediaminetetraacetate ('*tris*-potassium chloride medium'). The conventional sucrose-procedure proved to be unsuitable because of gel-formation during homogenization. The excised muscle-specimens were quickly immersed in ice-chilled *tris*-potassium chloride medium, cut into small pieces and homogenized in 3–4 volumes of *tris*-potassium chloride medium by means of an all-glass Potter–Elvehjem homogenizer. All operations were performed at 0–2° C. The homogenate was diluted with *tris*-potassium chloride medium to contain 1 gm. muscle per 10 ml., and centrifuged in a Model *L* Spinco ultracentrifuge, rotor 30, with 2,500 r.p.m. for 5 min. to remove nuclei and myofibrils. The supernatant was decanted and recentrifuged in the same rotor with 10,000 r.p.m. for 10 min. The resulting sediment, representing the mitochondrial fraction, was resuspended in *tris*-potassium chloride medium and recentrifuged as above. The washing medium was discarded, and the surface of the tightly packed pellet was rinsed several times with 0.25 *M* sucrose in order to remove the last drops of *tris*-potassium chloride medium. The pellet was finally suspended in 0.25 *M* sucrose to contain mitochondria from 1 gram muscle per ml. of suspension.

Respiration was measured by the conventional Warburg method, with air as the gas-phase, and with 0.2 ml. 2 *M* potassium hydroxide in the centre wells. Each manometer-vessel contained mitochondria from 1 gram muscle, 10 µmol. substrate (potassium salt), 50 µmol. potassium phosphate (*p*H 7.5), 3 µmol. disodium adenosine triphosphate, 8 µmol. magnesium chloride, 250 µmol. sucrose, and where indicated, 50 µmol. glucose and an excess of yeast hexokinase, in a final volume of 2 ml. The temperature was 30° C. and the vessels were thermo-equilibrated for 5 min. Phosphate uptake was estimated by the isotope distribution method described by Lindberg and Ernster[5]. The phosphate/oxygen ratio was calculated by dividing the phosphate uptake in µmol. during 25 min. by the 20-min. oxygen-consumption value in microatoms, corrected by extrapolation for the 5-min. period of thermo-equilibration. The test-system for adenosine triphosphatase contained mitochondria from 200 mgm. muscle, 10 µmol. disodium adenosine triphosphate, 10 µmol. *tris*-(hydroxymethyl) aminomethane buffer (*p*H 7.5), 90 µmol. potassium chloride, and 250 µmol. sucrose, in a final volume of 2 ml. 2,4-Dinitrophenol was present, when indicated, in a final concentration of 0.1 m*M*. The samples were incubated in open tubes with gentle shaking at 30° C. for 20 min. After fixation with perchloric acid, inorganic phosphate was estimated by the modified Martin and Doty method[5].

Fig. 1 compares the respiration obtained with various substrates in skeletal muscle mitochondria from a normal and a hypermetabolic (case 3, first biopsy) subject. Both preparations catalysed the oxidation of various Krebs cycle metabolites and of glutamate according to similar patterns. Although the absolute rates of respiration varied to some extent from one preparation to another (Table 1), the relative rates obtained with the various substrates were fairly consistent and independent of the species of skeletal muscle used; moreover, a similar picture was also found with skeletal muscle mitochondria from rat. Pyruvate (in the presence of malate) and α-ketoglutarate were oxidized at relatively high rates, whereas other Krebs cycle metabolites, including pyruvate or malate alone, were oxidized only slowly; the rate of oxidation of glutamate varied between high and medium-high from one preparation to another. Of some interest may be the relatively slow rate at which succinate was oxidized. This finding was in sharp contrast to the case found with mitochondria from other vertebrate tissues, including

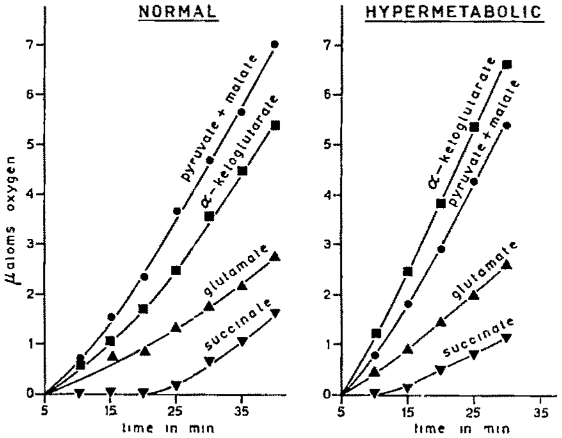

Fig. 1. Respiration of skeletal muscle mitochondria in the presence of various substrates. Muscle specimens (in reference to Table 1): normal subject, case 3; hypermetabolic subject, case 3*a*. For experimental conditions, see text. Hexokinase and glucose were added to all samples

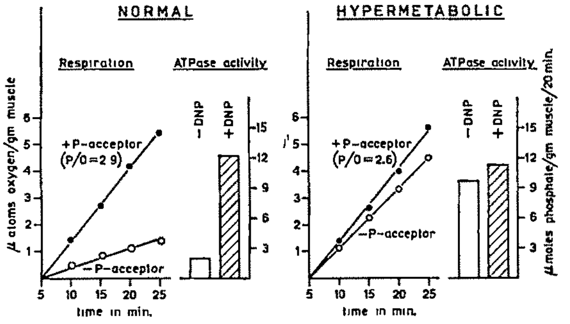

Fig 2 Respiratory control, phosphorylative efficiency and adenosine triphosphatase activity of preparations of human skeletal muscle mitochondria Muscle specimens (in reference to Table 1) normal subject, case 1 , hypermetabolic subject, case 3*b* For experimental conditions, see text Substrate pyruvate + malate Hexokinase and glucose were added to samples marked '+ P-acceptor' DNP=2,4-dinitrophenol

heart muscle sarcosomes Glycerol-1-phosphate, which is oxidized at an extremely high rate in insect flight muscle mitochondria[6], was oxidized only very slowly, if at all, in the present preparations In general, the data presently available give the impression that, in the case of vertebrate skeletal muscle mitochondria, the two α-keto acids are the only Krebs cycle metabolites with a free access to the mitochondrial enzymic sites In none of these respects were there any differences between the mitochondria from the normal and hypermetabolic groups. Furthermore, addition of diphosphopyridine nucleotide resulted in no increase in the respiration (with pyruvate + malate as substrate), indicating that the mitochondria from both the normal and hypermetabolic subjects had an adequate complement of bound diphosphopyridine nucleotide

The capacity to respiratory control was tested according to Lardy and Wellman[2], by measuring the increase in respiratory rate occurring upon the addition of an excess of yeast hexokinase and glucose in the presence of a catalytic amount of adenosine triphosphate Glucose serves in this system as a terminal phosphate acceptor, removing, by way of the hexokinase-reaction, the adenosine triphosphate formed during respiration, and thus continuously regenerating adenosine diphosphate In carefully prepared mitochondria from most vertebrate tissues, respiration is tightly coupled to phosphorylation, and therefore, a continuous supply of adenosine diphosphate is necessary to maintain a maximum level of respiration As seen in Fig 2, the skeletal muscle mitochondria from a normal and a hypermetabolic (case 3, second biopsy) subject revealed a marked difference in this respect In the normal case, the respiration obtained in the absence of a terminal phosphate acceptor was relatively low and was increased to a considerable extent—by more than 300 per cent—by the addition of hexokinase and glucose The hypermetabolic mitochondria, on the other hand, exhibited a nearly maximal rate of respiration even in the absence of a terminal phosphate acceptor, and hexokinase and glucose stimulated it only by about 20 per cent By sharp contrast, both mitochondrial preparations revealed normal phosphorylative efficiencies, the phosphate/oxygen ratios in the presence of hexokinase and glucose being 2 9 in the normal and 2 6 in the hypermetabolic case, as compared with the theoretical maximum of 3 This, it appears that while both preparations were capable of coupling respiration to phosphorylation to a normal extent, this coupling was markedly looser in the hypermetabolic than in the normal mitochondria.

Another means of demonstrating this difference between the two preparations with respect to the tightness of the coupling of respiration to phosphorylation has been to investigate their adenosine triphosphatase activities in the absence and presence of 2,4-dinitrophenol. It is a well-established fact that carefully prepared mitochondria exhibit a very low adenosine triphosphatase activity and that this activity can be greatly stimulated by a concentration of dinitrophenol that uncouples phosphorylation from respiration[3] As shown in Fig 2, the mitochondria from the normal-metabolic subject followed this pattern in exhibiting a relatively low endogenous adenosine triphosphatase activity, which could be stimulated 5 7-fold by 0 1 m*M* dinitrophenol , this value is in good agreement with that reported by Chappell and Perry[4] for pigeon breast muscle mitochondria The mitochondria from the hypermetabolic subject, on the other hand, exhibited a relatively high endogenous adenosine triphosphatase activity, and the stimulatory effect of dinitrophenol was only 1 1-fold It is noteworthy that the endogenous adenosine triphosphatase of the hypermetabolic subject's mitochondria did not require magnesium ions as an activator, in contrast to the adenosine triphosphatase that can be elicited in isolated normal mitochondria by exposure to conditions which cause structural alteration, for example, ageing[3] That the activity of adenosine triphosphatase was truly endogenous and not due to contaminating myosin could be ascertained by showing that it was greatly inhibited, to the extent of 85 per cent, by 3 5 m*M* atebrin As recently shown by Low[7], this compound, in the concentration mentioned, almost completely inhibits the endogenous mitochondrial adenosine triphosphatase but leaves myosin-adenosine triphosphatase unaffected

In Table 1, cumulative data are shown regarding respiratory rate, phosphate/oxygen ratio, respiratory control, and dinitrophenol-stimulability of adenosine triphosphatase, from a number of normal cases and the three hypermetabolic cases previously described Pyruvate + malate was used as substrate throughout these experiments The two groups differed consistently with respect to the extents of respiratory control, the stimulation of respiration by hexokinase and glucose varying between 4 1- and 16 3-fold in the normal, and between 1 2- and 2 4-fold in the hypermetabolic group Significant, though less marked, was the difference in the dinitrophenol-stimulation of the adenosine triphosphatase, which was 2 7- to 5 7-fold in the normal group and 1 1- to 3 4-fold in the hypermetabolic group The phosphate/oxygen ratios were, as an average, somewhat lower in the hypermetabolic than in the normal cases, but, as cases 1 and 3*a* show, virtually normal phosphate/oxygen ratios could definitely be obtained in mitochondria with a markedly low respiratory control Finally, the respiratory rates per gram muscle varied somewhat from one experiment to another, and so did also the maximum (dinitrophenol-stimulated) rates of the adenosine triphosphatase reaction The reasons for these variations, which were equally present in the normal and hypermetabolic cases, are being investigated

The concept that the mitochondrial respiratory control may constitute the biochemical basis of thyroid hormone action was first formulated by

Lardy[8] This effect has often been interpreted as a secondary consequence of a lowered phosphorylative efficiency[9], a deficient complement of bound mitochondrial co-factors, notably diphosphopyridine nucleotide[10], or a swollen mitochondrial structure[11] Yet, Lipmann *et al* [12] were able to demonstrate a normal phosphorylation and no deficiency of diphosphopyridine nucleotide when liver mitochondria from thyrotoxic animals were incubated under appropriate conditions

The present results support the concept that a deficient control of respiration by available phosphate acceptors, paralleled by an increased endogenous adenosine triphosphatase activity, constitutes the primary manifestation of the hypermetabolic state at the mitochondrial level The data seem clearly to eliminate the possibility of these changes being secondary to other alterations of the mitochondrial enzyme organization of the types mentioned above, at least as far as a lowered phosphorylative efficiency and a deficient complement of bound co-factors, such as diphosphopyridine nucleotide and magnesium, are concerned Furthermore, according to preliminary data, these mitochondria reveal no increased tendency to swelling , the fine structure of the mitochondria *in situ* is being investigated by electron microscopy Finally, the results also seem to indicate that this alteration of the mitochondrial function may be present regardless the etiology of the hypermetabolism, and that, as case 3 indicates, a thyroid disorder is no prerequisite of the mitochondrial dysfunction described in the present work

Recently, Remmert and Lehninger[13] reported the isolation from mechanically disrupted mitochondria of a protein factor which, when added to phosphorylating mitochondrial fragments abolished the respiratory control without appreciably affecting the phosphate/oxygen ratio The release of this factor from the mitochondria may, according to these authors, be subject to physiological or endocrine control, determining the state of respiratory control in the cell The possible involvement of Remmert and Lehninger's factor in the present connexions is being investigated

SEROLOGICAL DISTINCTION OF ADULT AND FŒTAL HUMAN HÆMOGLOBIN

By G. R E. NAYLOR and Mrs. M E. ADAIR

Department of Pathology and Physiological Laboratory, Cambridge

THE interpretation of serological studies of hæmoglobin is difficult because a preparation of hæmoglobin may contain two or more distinct hæmoglobins as well as other soluble antigenic constituents of the red cell Markowitz, Cartwright and Wintrobe[1] have investigated quantitatively antisera prepared against erythrocuprein Among the anti-hæmoglobin sera used in the present work several contained anti-carbonic anhydrase Boivin and Hartmann[2] found several antigens in the hæmoglobin solutions used in their serological studies , they obtained evidence that two of the antigens in normal adult red cells were hæmoglobins Ruggieri and Marchi[3] have also presented serological evidence of two hæmoglobins in preparations from adult red cells and considered one of them to be fœtal hæmoglobin

In the present work, serological differences between hæmoglobin from adult human blood and from umbilical-cord blood have been demonstrated by Oakley and Fulthorpe's agar diffusion technique[4] Antisera were obtained from rabbits which received intravenous injections of adult human hæmoglobin without adjuvant The antiserum used for the experiments shown in Figs 1 and 2 and Table 1 gave a red precipitate containing 5 08 mgm protein which included 0 47 mgm hæmoglobin when 1 ml. antiserum was mixed with homologous antigen in slight antiserum excess of the optimal proportions[5]

In agar diffusion experiments, antiserum was mixed with an equal volume of 2 per cent agar at 50° C , the mixture was put in a tube of 6 5 mm calibre to make a column 18 mm long and allowed to solidify 1 per cent agar was added to make a column 17 mm long and, after this had solidified, 0 3 ml of 0 16 per cent hæmoglobin was added Agar and antigens

Table 1

Hæmoglobin antigen number	Distance in mm between lower boundaries of two precipitation bands in agar after 11 days	Optimal proportions titrations	
		Optimal ratio with 1 per cent antigen	Flocculation time of optimal mixture with antiserum diluted 1 in 25
Adult 1	—	1 15	4 min 45 sec
Cord blood 2	3 7	1 22	17 min 30 sec
Cord blood 3	2 9	1 23	13 min 30 sec
Cord blood 4	2 0	1 21	12 min 30 sec
Cord blood 5	1 2	1 19	8 min 15 sec

were dissolved in 0 85 per cent sodium chloride , 1 in 10,000 merthiolate was present in each reagent and the *p*H of the antigens and of the 1 per cent agar was adjusted to about 7 8 by addition of sodium bicarbonate

Fig 1 shows the reaction observed after eleven days at room temperature In each tube antigen and antibody have diffused into the middle layer, which consists of agar only, and a band (really a disk) or bands of precipitate have formed in this layer Antigen 1, which was hæmoglobin prepared from adult human blood, showed one band of red precipitate Antigens 2, 3, 4 and 5 were hæmoglobin obtained from the umbilical-cord blood of four individual babies, all showed two bands of red precipitate after two days The number of bands of precipitate formed in agar diffusion experiments is an indication of the least number of antigens concerned in the reaction The distance between the lower boundaries of the two bands shown by cord-blood hæmoglobin differed with different samples of cord blood (see Fig 1 and Table 1) Antigen 2 was prepared from the cord blood of a premature baby (35 weeks gestation) , antigens 3, 4 and 5 were prepared from the cord bloods of babies which were believed to be born at term Antigen 2 contained 87 per cent of fœtal (alkali-resistant) hæmoglobin estimated by the method of Jonxis[6] , antigen 3 contained 83 per cent of fœtal hæmoglobin Antigens 4 and 5 had been prepared as carboxyhæmoglobin and Jonxis's method could not be used

Fig 2 shows the flocculation times[7] observed in constant antiserum titrations when serial dilutions of the antigens reacted with the antiserum diluted 1 in 25 In contrast with the agar diffusion experiments, none of the titrations disclosed two distinct zones of reaction, but the shapes of the curves, particularly those for antigens 2, 3 and 4, suggest that more than one antigen–antibody system was involved The optimal ratios[5] of the antiserum determined in the titrations with the five antigens are recorded in Table 1 together with the flocculation times of the optimal mixtures, that is, the first mixture in each titration to show visible particles of precipitate With the hæmoglobin from the four cord bloods there is a correlation between the flocculation time of the optimal mixture and the distance between the lower boundaries of the two red bands observed in the agar diffusion experiments shown in Fig 1

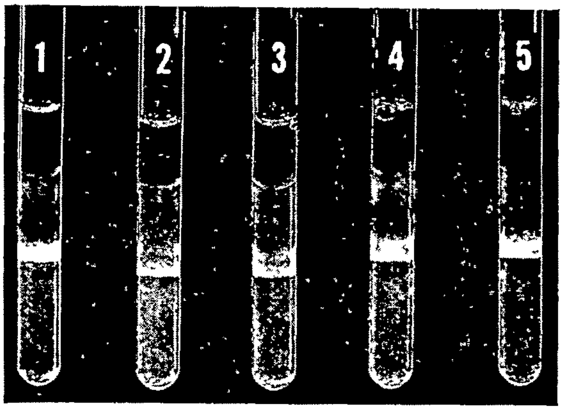

Fig 1 Precipitates formed in agar when an anti-adult-hæmoglobin serum reacts with adult hæmoglobin (antigen 1) and with hæmoglobin obtained from the umbilical-cord blood of four individual babies (antigens 2 to 5)

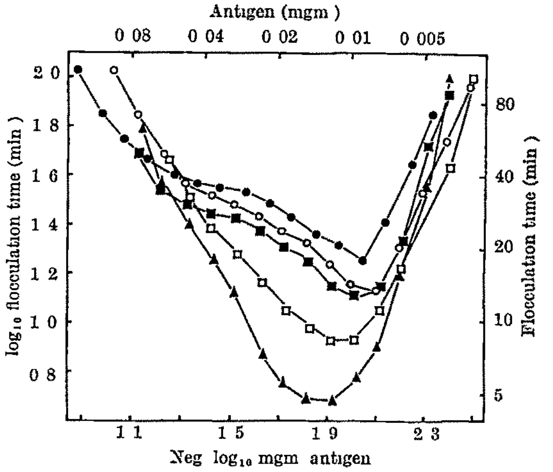

Fig 2 Constant antiserum titrations of an anti-adult-hæmoglobin serum with adult hæmoglobin (▲, antigen 1) and with hæmoglobin obtained from the umbilical-cord blood of four individual babies (●, antigen 2 , ○, antigen 3 , ■, antigen 4 , □, antigen 5) Antiserum diluted 1 in 25

A red precipitate containing 2 88 mgm protein was obtained when 1 ml of the antiserum was mixed with antigen 2 (cord-blood hæmoglobin) in slight antiserum excess of the optimal proportions When the antiserum was absorbed with an amount of antigen 2 which was approximately three times that in the optimal mixture, a bulky, bright red precipitate formed After centrifuging, the two bands of oxyhæmoglobin could be easily seen in the supernatant antiserum with a direct-vision spectroscope the presence of excess antigen was thereby demonstrated Addition of adult hæmoglobin to this supernatant antiserum gave a red precipitate which contained 1 17 mgm protein per ml antiserum Such distinction of adult and cord-blood hæmoglobin by absorption was not possible with all of twenty antisera examined, which showed considerable differences in the strength of their reactions with adult hæmoglobin after they had been absorbed in antigen excess with cord-blood hæmoglobin Some absorbed antisera failed to give a ring test with adult hæmoglobin during 2 hr observation, some reacted feebly and some yielded sufficient precipitate for quantitative determinations All these twenty antisera reacted rapidly with adult hæmoglobin before absorption

Aksoy[8] has cited experiments which show a lack of uniformity in the reactions of anti-cord-blood hæmoglobin sera absorbed with adult hæmoglobin In studies on the reactions of adult and of fœtal hæmoglobin with anti-adult-hæmoglobin sera prepared in chickens, Goodman and Campbell[9] found that individual antisera gave different values for the ratio between the maximum amounts of antibody precipitated by the two antigens In the present work similar results were obtained with antisera prepared in rabbits

FORTHCOMING EVENTS

*(Meeting marked with an asterisk * is open to the public)*

Tuesday, December 29

Radar and Electronics Association (at the Royal Society of Arts, John Adam Street, Adelphi, London, W C 2), at 7 30 p m —Dr K R Sturley "High Quality Sound Broadcasting" *

Wednesday, December 30

Royal Society of Arts (at John Adam Street, Adelphi, London, W C 2), at 2 30 p m —Dr J D Carthy "Animal Senses and Reactions" (First of two Juvenile Lectures Further lecture on January 6)

Institution of Electrical Engineers (at Savoy Place, London, W C 2), at 3 p m —Mr G G Gouriet "Colour Television" (Christmas Holiday Lecture To be repeated on Thursday, December 31)

Friday, January 1

Plastics Institute (in the Lecture Theatre of the Institution of Electrical Engineers, Savoy Place, London, W C 2), at 2 30 p m —Dr N A de Bruyne "Sticky Plastics" (Sixth Lecture for Young People)

APPOINTMENTS VACANT

Applications are invited for the following appointments on or before the dates mentioned

Lecturer or Assistant Lecturer in Geography at Makerere College (The University College of East Africa)—The Secretary, Inter-University Council for Higher Education Overseas, 29 Woburn Square, London, W C 1 (December 30)

Graduate Assistant (with appropriate professional qualifications and/or experience) in the College Library—The Principal, Royal Holloway College (University of London), Englefield Green, Surrey (December 31)

Research Fellow (with a good degree in electrical engineering, physics or chemistry, and some research experience of vacuum systems) in the Department of Electrical Engineering—The Registrar, Queen Mary College (University of London), Mile End Road, London, E 1 (December 31)

Professor of Applied Mathematics—The Secretary and Registrar, University College of North Wales, Bangor, North Wales (January 1)

Lecturer (with a good honours degree in mining engineering and practical experience in mine surveying) in Mining Engineering and Mine Surveying—The Registrar, The University, Nottingham (January 9)

Lecturers (with a special interest in servomechanisms, measurements, high voltage or network theory) in Electrical Engineering —The Registrar, Manchester College of Science and Technology, Manchester 1 (January 9)

Lecturer or Assistant Lecturer in Chemistry at the University of Malaya (Singapore Division)—The Secretary, Inter-University Council for Higher Education Overseas, 29 Woburn Square, London, W C 1 (January 15)

Chair of Chemistry—The Registrar, University College of Wales, Aberystwyth (January 16)

Visiting Professor in Oceanography at the University of Cape Town, South Africa—The Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W C 1 (South Africa, January 31)

Head (with high academic qualifications in a branch of soil science or agronomy and considerable research experience and administrative ability) of the Soils Division, Rubber Research Institute of Malaya, Kuala Lumpur, for duties which will embrace the preparation, direction and development of a research programme in soil science nutrition of the rubber tree (*Hevea brasiliensis*) and general assistance in the advisory work of the Soils Division of the Institute—The Secretary, London Advisory Committee for Rubber Research (Ceylon and Malaya), Commonwealth Institute, Imperial Institute Road, London, S W 7 (March 1)

Assistant (preferably with some knowledge of horticulture and experience in proof correcting and indexing) to the Editor—The Secretary, The Royal Horticultural Society, Vincent Square, London, S W 1, marking envelope "Confidential"

Assistant Trials Officer (preferably with practical experience in crop production), to work at Leeds University Farm, Headley Hall, Yorks—The Secretary, National Institute of Agricultural Botany, Huntingdon Road, Cambridge

Chemistry Master (good sixth form work available for a man of the right qualifications)—The Headmaster, The School, Oundle, Peterborough

Cytologist or Cytogeneticist (with experience of chromosomal work) to work on human chromosomal anomalies—The Director of the Medical Research Unit, National Spastics Society, Department of Child Health, Guy's Hospital, London Bridge, London, S E 1

Editor and Technical Officer (with experience in editorial work, a sound knowledge of chemistry, and preferably familiarity with one or more foreign languages) to the Society of Dyers and Colourists —The Secretary, The Society of Dyers and Colourists, Dean House, 19 Piccadilly, Bradford, Yorkshire

Lecturer, Assistant Professor, and an Associate Professor in the Department of Mathematics—Prof E S Keeping, Mathematics Department, University of Alberta, Edmonton, Canada

Lecturer (with a good honours degree with teaching and industrial or research experience) in Mathematics—The Clerk to the Governors, South-East Essex Technical College and School of Art, Longbridge Road, Dagenham, Essex.

Organic Chemist, to participate in a biochemical research programme—Dr Sadler, Courtauld Institute of Biochemistry, Middlesex Hospital Medical School, London, W 1

Reader or Consultant in Nuclear Physics—The Principal, Bradford Institute of Technology, Bradford

Physicist (Senior Grade) (with previous experience in hospital physics), to work under the direction of the Principal Physicist in the Radiotherapy Department—The Superintendent, Guy's Hospital, London Bridge, London, S E 1

SCIENTIFIC RESEARCH IN GREAT BRITAIN

THE tenth annual report of the Advisory Council on Scientific Policy*, covering the year 1958–59, deals with three main topics scientific man-power, space research and overseas scientific relations Of the first, it may be said that the Advisory Council comments briefly on the results of a further survey of scientific and engineering man-power made last winter by the Ministry of Labour and National Service along the same lines as that conducted in 1956 The Council agrees with the Scientific Man-power Committee that the experience of three years is an insufficient basis for a detailed re-assessment of the long-term demand, but its general comments are more conveniently discussed in considering this second report on Scientific and Engineering Man-power in Great Britain itself, which has been published separately

Besides these surveys, the main report refers briefly to the development of the National Lending Library of Science and Technology, which is now expected to be in full operation by 1962, and to the inquiries made during the year into research contracts of United States Agencies with British universities and institutions in an endeavour to assess the total amount of such financial support and the principles on which it is given On the former matter, it is startling to read that the Advisory Council believes that its responsibilities towards such schemes can now be regarded as satisfactorily concluded The report describes briefly what is being done in the way of buildings and the collection of scientific literature by the Lending Library Unit of the Department of Scientific and Industrial Research, and refers appreciatively to the sponsorship by this Lending Library Unit of translations of eight Russian periodicals

It is only two years since the Advisory Council first reported progress towards the establishment of a National Lending Library of Science and Technology, and even a year ago it was expressing concern at the failure to establish the National Reference Library of Science and Invention The two projects are inter-related and serious doubts are entertained by competent judges as to how far either is likely to be efficient in the absence of the other, apart from any question of duplicating resources For that reason and for the further reason that the Advisory Council's own recommendations for the National Lending Library included collaboration with the existing regional and specialist library services in the supply of scientific literature, this statement in the report reads rather like dereliction of duty Even with the appointment of a consultative committee to advise the Department of Scientific and Industrial Research from the point of view of the users of the Library on the services to be provided by it, the Advisory Council ought not to disclaim either responsibility or interest.

The Advisory Council's report does not mention the appointment of this committee, the membership of which has been announced, but, on the Advisory Council's own showing, an adequate lending and reference service of scientific libraries bears so closely on both the supply of scientific and technical man-power and its efficient use that the Advisory Council can scarcely avoid a continuing interest in the provision of such services Incidentally, the users do not seem to be adequately represented on that committee In any event, it will probably be necessary for the Council to continue to exert its influence in order to overcome the obstacles to co-operation and to ensure that adequate resources are placed at the service of the library system as a whole Indeed, from this point of view, although the Roberts Report on the Public Library Service was addressed to the Minister of Education, some comment on the report might have been looked for from the Advisory Council, for Sir Sydney Roberts's Committee gave due consideration to the relation of public libraries to other libraries, including scientific libraries

On the matter of research contracts with British universities and institutions, the Advisory Council estimates that financial support for research in Britain from Government agencies and charitable foundations in the United States amounts to about £1 5 million per annum, of which about 1 5 million dollars comes from charitable foundations, such as the Rockefeller, Ford and Kellogg Foundations, a like sum from United States civilian agencies such as the National Science Foundation, and about half that sum from United States Service departments and agencies , and most of the money from Government agencies has so far been in the form of contracts for specific projects While welcoming the substantial support this affords for research in Britain, the Advisory Council recognizes that research grants, and particularly specific contracts of this magnitude, could influence considerably the general pattern of research Accordingly, with the full co-operation of the United States authorities, who fully appreciate the position, it is seeking to extend to all such contracts existing arrangements by which all research contracts placed by United States Service departments are notified to the British departments and research councils concerned Without interfering with the freedom of university departments to accept or reject contracts which are offered to them, the arrangements should make it possible to co-ordinate British and United States offers of financial support for research, and should also ensure that the general terms of the various contracts are on a uniform basis. While the Advisory Council hopes that in future a substantial proportion of the funds available will be provided in the form of grants, its inquiries did not indicate that the terms of contracts and security considerations hindered either the freedom of the research worker concerned or the publication of his results

---

* Annual Report of the Advisory Council on Scientific Policy 1958–1959 (Cmnd 893) Pp iv+14 (London H M Stationery Office, 1959) 1s net

The linking of research and other scientific activities in the United Kingdom is further illustrated in the section of the Advisory Council's report which deals with overseas scientific relations Reference was made in the Advisory Council's last annual report to the establishment by the North Atlantic Council of a Science Committee on which the United Kingdom representative is Sir Solly Zuckerman This Committee has recently set up a small study group of scientists, under the chairmanship of M Louis Armand, to review the whole field of scientific effort in the North Atlantic Treaty Organization countries, and to direct attention to underlying weaknesses or gaps, and the results of this study are expected to be available next year Under the Organization for European Economic Co-operation, which is at present reviewing its committee system, the Committee on Scientific and Technical Personnel has developed a senior visiting fellowhip programme, designed to enable research institutions to send their own research workers abroad, or to invite research workers from foreign institutions to visit them , this appears to be meeting a need in many countries The Committee on Applied Research also has developed a number of practical co-operative research projects

The Government's decision to set up an Overseas Research Council is warmly welcomed in the Advisory Council's report, which stresses the urgency and importance of the matters with which the new Council will have to deal Emphasizing the value of the contribution which the United Kingdom has to offer to the development of the overseas territories, the Advisory Council hopes that the new Council will both be able to advise Ministers on the type of assistance that is most needed and also act as a focus of interest in the application of research, both in and for the overseas territories The new Council should, it thinks, prove a useful complement in the scientific field to the work being undertaken in the educational field as a result of the recent Commonwealth Education Conference

The close relation between research and education in the overseas territories is one reason for hoping that, while the detailed activities in research overseas will doubtless in future be described in the annual reports of the Overseas Research Council, the Advisory Council on Scientific Policy will not cease to concern itself with the broad issues and with the inter-relations with research in other fields and with education Moreover, it has still to be seen if the Overseas Research Council can supply that overall conspectus of overseas research rather than the sectional reports, however admirable in themselves, to which "Colonial Research" has hitherto been limited Such a conspectus is increasingly desirable in view of the growth in scale and extent of research in the Colonial and other overseas territories, and of the collaboration with the United States in this field The appointment by the Lord President of the Council, pending the establishment of the Overseas Research Council, of a scientific panel, under the chairmanship of Sir Alexander Todd, to collaborate with a corresponding American panel, set up by the National Science Foundation in the United States, to prepare a report on the application of science to problems in Africa for the United States International Co-operation Administration is a step in the right direction

It was in accordance with the advice of the Advisory Council on Scientific Policy that the British Government authorized a programme for the design and construction of instruments to be carried in a series of Earth satellites, and with the establishment of a Steering Group under Sir Edward Bullard to supervise and co-ordinate the general Government interest in the programme, so that the direct concern of the Advisory Council with the present programme of space research terminated Nevertheless, the Advisory Council, in the present report, does not content itself merely with summarizing concisely the steps which led to the initiation of that programme, and the subsequent agreement of the United States National Aeronautics and Space Administration to provide space in a series of satellites to be launched over a period of three to four years for a number of British instruments designed to carry out a scientific programme under the general supervision of the British National Committee for Space Research It also takes the opportunity of setting out principles which it believes should underlie British participation in this field of endeavour

Space research, it is pointed out, especially when it proceeds beyond the stage of launching small Earth satellites, must make enormous and increasing demands on scientific and financial resources, and we in Great Britain cannot hope to provide all the resources necessary to develop space exploration independently on an equal footing with the United States and the U S S R Nevertheless, the Advisory Council is convinced that British scientists have an important and useful part to play in this new field, and that if they are provided with the means to carry their scientific instruments into space, carefully designed experiments with Earth satellites can contribute to the solution of important scientific problems and often provide the most economical method of obtaining the data needed Ventures into space with lunar, planetary or solar probes would be far more costly, and in the Advisory Council's opinion the scientific and technological return is unlikely to be commensurate with the cost British participation in such activities at the present time is not recommended

The Advisory Council does not expect the scientific programme at present authorized to have in itself any adverse effect on the man-power situation in British industry , indeed, there may be some stimulus to micro-instrumentation Nevertheless, the Advisory Council reiterates that the technological advantages likely to accrue from the development of a British rocket and satellite programme designed for civil purposes, over and above the effects of the existing military missile programme, would be insufficient to justify the very considerable expenditure involved When the results of the design studies at present being carried out on the adaptation of British military rockets are available, it will be possible to decide whether the additional expenditure and diversion of effort involved in a purely British satellite programme may be justified by the results which can be expected

The Advisory Council is not unmindful of the claims of prestige, but rightly it stresses the all-important question of priorities for a nation with limited resources Once again it emphasizes the importance of adequate expenditure on research and development in those fields which vitally affect the welfare of our people, the strengthening of our economic position and the improvement of standards of living in the under-developed countries, particularly in Commonwealth countries and Colonial territories It is incontestably right in urging that it would be the grossest folly to leave these needs unsatisfied in order to embark on a large programme of space exploration on a purely national basis, and in suggesting that in such a field the right approach is that of international collaboration

There may well be other fields in which the contribution appropriate to the special skills and resources available in Great Britain is best made on an international basis, and the newly established co-operative agreement with the United States already noted, and the further agreement for United Kingdom participation in a joint United States/Canadian Working Party to conduct experiments on the ionosphere by means of rockets are to be welcomed on general as well as on specific grounds The Advisory Council's latest report provides conclusive evidence of the value of the Council, provided that its authority is properly sustained and its recommendations are effectively presented It is manifest that Lord Hailsham, as Minister for Science, has at his hand an admirable instrument, with a realistic sense of priorities and the wide vision and clear understanding that are essential in securing co-operation and co-ordination in either science or technology

A HISTORY OF MAGIC AND EXPERIMENTAL SCIENCE

A History of Magic and Experimental Science
By Prof Lynn Thorndike Vols 7 and 8 The Seventeenth Century Vol 7 Pp x+695 Vol 8 Pp viii+808 (New York Columbia University Press, London Oxford University Press, 1958) 80*s* net each volume

THE publication by Prof Lynn Thorndike of Vols 7 and 8 of his great work, "A History of Magic and Experimental Science", completes a task on which he has been engaged for more than fifty years The first two volumes appeared in 1923[1], but the author's interest in the subject extends back to a much earlier stage in his career While still a student at Columbia University, New York, in 1902–3, it was suggested to him that a study of magic in medieval universities would form a suitable subject for a master's degree The more immediate outcome of his initial researches in this field appeared in 1905, in a book entitled "The Place of Magic in the Intellectual History of Europe This was followed by his "History of Medieval Europe"

After leaving Columbia, Prof Thorndike served as associate professor of history in the Western Reserve University, and while there the first two volumes of his *magnum opus* were published Shortly afterwards, in 1924, he returned to Columbia on appointment as professor of history in that University It is evident that by this time Prof Thorndike had already acquired a deep interest in the history of science, for he was one of the founder members of the History of Science Society established in the United States in 1924, later serving as its president, and in 1928 he was instrumental, with others, in setting up the Académie internationale d'Histoire des Sciences It is from the fusion of these two interests, medieval history and the history of science, that his eight-volume work has grown

The first two volumes cover the first thirteen centuries of the Christian era They were reviewed by George Sarton, in *Isis*[2], and the review was a critical one While admitting that the work was one of major importance, the reviewer expressed the opinion that the title was so misleading as to be deceptive In Sarton's view, it was not a history of the science of the period, still less of experimental science, as these two terms should be understood While there is something to be said for Sarton's point of view, it seemed a little pedantic, because, as he later admitted, what passed for science in medieval times was, for the most part, inseparably linked with the practice of astrology, alchemy and divination, and with the lore of gems and amulets

Volumes 3 and 4 were published in 1934, and cover the fourteenth and fifteenth centuries In Vol 3 (p 22) Prof Thorndike met Sarton's criticism, intentionally or otherwise, with the statement that his work was to be regarded as a history of the relations between magic and experimental science, and this certainly defines the scope of the work rather more closely These two volumes also were reviewed by Sarton[3], and this time, while repeating his opinion that the title was misleading, he was less critical, and he conceded that, since medieval thought was governed by astrology, alchemy and divination, Prof Thorndike's work might be called a history of scientific thought He pointed out, not unreasonably, that the term 'experimental science' was used by the author in far too loose a sense

Vols 5 and 6, which appeared in 1941, cover the sixteenth century, and, in Vol 5 Prof Thorndike, in discussing the first six volumes, states "Like Moses we have brought the reader through the wilderness to within sight of the promised land of modern science It remains to be seen whether we shall enter in or whether we shall content ourselves with viewing the prospect o'er from the other—magical—side of Jordan" Fortunately, the author decided to cross this intellectual Jordan, and continues his story to the end of the seventeenth century in his last two volumes

Prof Thorndike has deliberately restricted his study, in time, to the Christian era, and in space to the Western world In these last two volumes he has moved forward to the seventeenth century, to the period when the great expansion in the search for knowledge took place, which has been called by Dr Charles Singer the 'insurgent' century and by others one of scientific revolution It is in this period that many of the experimental and observational sciences have their main roots and begin to take on a more modern form, and for this reason Vols 7 and 8 are likely to have a wider appeal than the earlier ones Their main thesis, however, is the extent to which the belief in magic and the occult, universal in preceding centuries, lingered on through the seventeenth century, even in the minds of learned men, a fact that is not usually emphasized in the more conventional histories of science, though the evidence is ample These last two volumes provide a link between the age of magic and that of modern science

The two volumes cover 1,500 pages, and it is impossible to discuss their contents in detail within the limits of a review, but the following selection from the titles of the forty chapters gives an indication of the field covered Vol 7 includes the following "Backward Glance", "Kepler and Galileo", "Francis Bacon", "Alchemy and Iatro-Chemistry to 1650", "Mineralogy", "Natural Magic", "Interest in the Occult in German Universities", "Harvey and Patin", "Descartes", "The Underground World of Kircher and Becher", and "Artificial Magic and Technology" Vol. 8 has chapters on "Natural History, especially of Animals", "Botany", "Chemical Courses and Manuals", "Robert Boyle", "Academies and Scientific Societies", "Astrology after 1650", "Medicine and Physiology", "Illicit Magic", "Sir Isaac Newton", and "The Last Decade"

Prof Thorndike's treatment of the scientists and subjects discussed always emphasizes the credulity of the age His opinions are personal views, uninfluenced by the generalizations of other writers, and based solely on his own very extensive reading For example, of Robert Boyle he writes "In Boyle himself we have an example *par excellence* of one beginning to shuffle off the mystic robes of the magician and putting on the habiliments of modern science", but he considers the statement by a recent biographer of Boyle that the latter is generally known to have been an alchemist, "accepting theoretically and practically the doctrine of the transmutation of the elements"[4] is too strong an estimate of Boyle's position Some chapter headings might lead the unsuspecting reader to anticipate a discussion of the beginnings of systematic knowledge of some particular science, but he is likely to be disappointed That on mineralogy, for example, is almost solely concerned with the belief in the supposedly occult or medicinal properties of gems and minerals.

Prof Thorndike's work is in no sense a systematic or even a complete history of experimental science, or of science in general It is a very detailed and fully documented account of beliefs that held sway for centuries before the scientific revolution, beliefs that were so deeply ingrained in the human mind that they were only with difficulty discarded by the scientists and naturalists who actually brought about this revolution It is a work of great erudition The author records that in the last two volumes some 1,600 authors and men of learning are mentioned To the majority of readers most of these names are likely to be unfamiliar, if not entirely unknown If known, the books they wrote (some exist only in manuscript form) are frequently of such rarity as to be difficult of access to the average reader, and, furthermore, the fact that many are written in Latin means, to all but the few, that even if accessible they are unreadable Historians of science will be permanently in the author's debt for placing on record, in readable form, the results of his researches, which were carried out in many European libraries, as well as in those in the United States It is perhaps inevitable that these volumes often read as if they represent the transcription of a series of tidied-up note-books, interspersed with the comments of the author This is not to say, by any means, that the text is not easy reading, for it can be read with interest and pleasure, but it is regrettable that the author's conclusions on the numerous topics discussed are not summarized more often and more systematically

"The History of Magic and Experimental Science" is primarily a source-book and a work of reference, and as such is likely to be consulted for many years to come It is also a mine of bibliographical information Use of the book is greatly facilitated by the elaborate index, contained in Vol 8, which extends to 168 pages It seems unlikely that the ground covered by Prof Thorndike in these two volumes, and, indeed in the whole work, will ever again be re-traversed in such detail As a history of magic it is outstanding, as a history of science it should be read in conjunction with the more formal histories of science It is a pleasure to record that in December 1957 the author was presented with the George Sarton Medal, the highest award of the History of Science Society, for his numerous and valuable services to the history of science V A Eyles

OLD CHEMISTRY

Chymia

Annual Studies in the History of Chemistry, Vol 5 Edited by Henry M Leicester (Edgar F Smith Memorial Collection University of Pennsylvania University of Pennsylvania and Division of History of Chemistry, American Chemical Society) Pp 214 (Philadelphia University of Pennsylvania Press, London Oxford University Press, 1959) 40*s* net

It is six years since the previous volume of "Chymia" was published and it is good news that this attractive and valued selection of studies in the history of chemistry is again to appear annually The American Chemical Society has furthered the interests of chemistry in a way which is internationally acknowledged and esteemed, and the inclusion of the history of chemistry in *Chemical Abstracts* for a long time has shown that it has this side of its many interests at heart The editor of the present volume, well known for his valuable publications in the field, contributes an interesting paper on the spread of the theory of Lavoisier in Russia The volume begins with a well-deserved tribute to the memory of Edgar Fahs Smith (1854–1928) and a list of his numerous publications relating to the history of chemistry, written by H S Klickstein In a way, "Chymia" owes its existence to Edgar Fahs Smith, and his memorial collection in the University of Pennsylvania, left with an endowment, now includes part of C A Browne's collection and the library of Tenney L Davis, making up more than nine thousand volumes and three thousand portrait prints

The other papers cover a wide field, from ancient Mesopotamian metallurgy to the history of the structure of acetone One of the longer papers, by Daumas and Duveen, describes Lavoisier's large-scale decomposition and synthesis of water in February, 1785 There is an article by R E Schofield on Josiah Wedgwood as an industrial chemist and one by R Siegfried on the chemical philosophy of Humphry Davy American chemistry is represented by two papers, one on the Columbian Chemical Society by W D Miles and one by S M Edelstein on the chemical revolution in the United States as shown by the pages of the *Medical Repository*, a periodical initiated by Samuel Latham Mitchill in 1797 This paper is of interest in relation to Priestley, who published in Mitchill's journal

One can always have too much of a good thing, when interest tends to decline With such a relatively small publication as "Chymia", appearing once a year (as we hope it will), it follows that only material of the highest standard can find a place It can be read, and since its field is restricted to chemistry it is not swamped by publications towards which chemists, with their generally practical and objective outlook, feel little drawn Chemists can read and enjoy it, and even those who have little sympathy with historical studies as such cannot fail to find something in the pages of "Chymia" which will interest them We all know who proposed the name "aldehyde" Who first used the name "acetone" ? A search of all the standard literature does not answer this question, but it is answered in this volume of "Chymia" Every chemist who up to now has not seen this fascinating publication is strongly advised to repair his loss

J R Partington

PROPERTIES OF LIQUIDS

Liquids and Liquid Mixtures

By Dr J S Rowlinson (Modern Aspects Series of Chemistry) Pp ix+360 (London Butterworths Scientific Publications , New York Academic Press, Inc , 1959) 75*s* , 12 80 dollars.

DR ROWLINSON'S book is admirable in many ways In it is gathered together an impressive amount of quantitative information about the measured properties of liquids and liquid mixtures, and also a multitude of thermodynamics and statistical formulæ, including all those that are ever likely to be required for the correlation of purely thermodynamic properties No reader could possibly complain that the author has paid inadequate attention to the experimental literature, or has failed to take seriously the difficulties which arise in the most advanced statistical theories

The book, however, suffers from the defects of its qualities It is a commonplace that nothing but trivialities can ever emerge from a purely thermodynamic discussion of homogeneous phases, and yet the statistical theory of liquids does not appear until two-thirds of the way through the book One of the most valuable generalizations in the theory of liquids is the principle of corresponding states, and one would have thought that this principle, and its statistical basis, should have been introduced early on, as an invaluable first approximation from which real liquids, of course, deviate to varying degrees and for various reasons Again, the thermodynamic properties of mixtures cannot be understood at all without reference to the intermolecular potentials, and surely the most satisfactory way of dealing with them is to interpret the data in terms of statistical models as one goes along In this connexion it is a pity that nothing is said about the theory of Prigogine and his colleagues of 'ideal associated' solutions, or about the link-up between the spectroscopic and thermodynamic data on alcohol solutions Further, though this is a fault of the title rather than of the book, there is virtually no mention of transport properties, or of other non-thermodynamic measurements which have thrown so much light on the liquid state

The best chapters in the book are probably those on the critical state of pure liquids and liquid mixtures, and the final chapter on the statistical thermodynamics of mixtures of spherical molecules, which is based mainly on the work of W B Brown

Finally, it is certain that the purely descriptive chapters on the phase diagrams of mixtures will be of educational value to the chemical engineer, for whom the moral of the book is "Anything can happen and it probably will" H C Longuet-Higgins

SOILS OF TANGANYIKA

A Survey of Soils in the Kongwa and Nachingwea Districts of Tanganyika

By B Anderson Pp ix+120 (36 figures) (Reading . Department of Agricultural Chemistry, The University , Dar-es-Salaam Tanganyika Agricultural Corporation, 1957) n p

EVERYONE knows the dismal sequel to the ambitious scheme for the mechanized production of ground-nuts in East Africa, which was characterized by the failure to employ pedological methods on pedological problems After the horse had departed, some effort was made to shut the stable door and a very competent soil surveyor was set to work to make a proper study of the soils of the Kongwa and Nachingwea districts The publication under review presents his results and shows what can be achieved by one trained pedologist working 'on the cheap' with limited facilities, but with specialized technical assistance from various institutions The moral for would-be planners of land-use is obvious

The first two chapters contain descriptions of the topography, geology, climate, vegetation and soils of the two areas In each case the soils are described in detail and the soil patterns are shown on maps at 1/25,000 The latter are clear and pleasing to the eye, but the keys should have specified the parent material and topographic situation of each soil series, thus saving constant reference to the text

At Kongwa the main catena consists of red earths developed on a sandy loam from granitic gneiss and brown and grey calcareous valley-soils on colluvium and alluvium Some of the red earths are capable of cropping usefully in good years but the main limitation is the unreliability of the rainfall

In the Nachingwea area, the major areas are occupied by a 'textural catena' developed by differential washing of a deep mantle weathered from more basic gneiss The rainfall is nearly twice as high as at Kongwa and the wet season is somewhat longer

The next chapter describes the soil maps in detail and clarifies the topographic relationships with cross-sections In the last, there is a useful summary of ideas on the genesis of the soils and their relations to other tropical soils

The book is well illustrated with photographs and diagrams and is a valuable addition to our knowledge of East African soils R M S Perrin

Acoustique Musicale

(Marseilles, 27, 28, 29 Mai, 1959.) (Colloques Internationaux du Centre National de la Recherche Scientifique, No. 84.) Pp. 259. (Paris: Editions du Centre National de la Recherche Scientifique, 1959.) 3,400 francs.

FROM time to time the subject of musical acoustics earns itself a colloquium. There was one recently in London (see *Nature*, 183, 1293; 1959) and others have taken place in Switzerland and the United States. The colloquium the proceedings of which are under review was more ambitious, since from its audience it could be justly called international and was conducted at Marseilles, surprisingly under the patronage of the Centre National de Recherche Scientifique. Such gatherings usually attract a number of scientists who are amateur musicians but few professional musicians. The organizers of this one were fortunate in collecting an audience nearly equally divided between the two types. The papers presented indeed, with a few exceptions, fell into two classes, those concerned with the acoustics of musical instruments (the scientific) and those with intonation and musical scales (the arithmetic, if the writer of this notice may be pardoned for using the term). A surprising amount of 'academic' discussion was engendered concerning the effects of changing an interval in a scale by a small fraction say, a few cents, academic because real singers and instrumentalists do not hold intonation to such a precision.

One may have doubts whether this subject is an art or a science, but many readers of these proceedings will gain a refreshing insight into the range of interest and activity covered by the term 'musical acoustics'.

E. G. RICHARDSON

Biological Sciences

Vol. 2. Edited by J. G. Bugher, J. Coursaget and J. F. Loutit. (Progress in Nuclear Energy, Series 6.) Pp. x+422+xii. (London and New York: Pergamon Press, 1959.) 105*s.* net.

THIS is an editorial selection of thirty-five papers out of the many presented to some of the biological and medical sessions of the Second Conference on the Peaceful Uses of Atomic Energy (1958). The subjects range from the distribution of labelled drugs in the body, to radiation-induced ageing in mice and induced mutations in polygenic systems. The reviewer can only apply a further arbitrary selection. A remarkable paper by Barnes, Ford, Gray and Loutit reports the discovery that repopulation of hæmopoietic tissue by host cells in radiation-chimæra is often effected by a very few clones of cells, sometimes recognizable by chromosomal 'markers'.

Ullberg gives some beautiful examples of how the distribution, localization and metabolism of certain (labelled) drugs can be followed by auto-radiography; Muller reviews the recent contributions of *Drosophila* work to the knowledge of radiation-induced mutation.

General papers deal with the 'ageing' effects of radiations and, more generally, with the effects on the life-span. Others deal with agents modifying the biological effects of radiations, with the elimination of radioactive substances from the body and with chemical effects of radiations on particular substances. A considerable proportion of the book is concerned with the induction of mutations.

The book is an indispensable—though somewhat expensive—reference for laboratories in any way concerned with the biological effects of radiations.

G. PONTECORVO

Tracer Applications for the Study of Organic Reactions

By John G. Burr, Jr. Pp. x+291. (New York: Interscience Publishers, Inc.; London: Interscience Publishers, Ltd., 1957.) 7.50 dollars.

IN this book the author has attempted to present the evidence obtained by the use of isotopic tracers in the study of organic reaction mechanism. A very wide field has been covered, and in some sections, for example, that on migration aptitudes, a valuable critical discussion has been included. It is rather a pity that this standard has not been adhered to throughout and the work thus becomes rather uneven. Its main value lies in the full literature index which forms a most useful guide to further reading on the many reactions discussed. The literature coverage (up to early 1953) makes certain sections out of date at the time of writing but the author feels that the book will be of some value to the advanced worker who wishes to use it as a literature source book. Valuable appendixes on the subjects of reaction mechanism and handling of isotopic tracers, together with an additional list of references covering the period 1953–1954, are also included.

Index of Chemistry Films

A Comprehensive List of Films and Filmstrips on Chemistry and Related Topics. Pp. ix+150. (London: Royal Institute of Chemistry, 1959.) 5*s.*

THE object of this publication is to provide an up-to-date guide to the eight hundred or so films and two hundred or so film strips on chemical topics that are available in Great Britain. The films are classified according to subjects. Brief information is supplied on how any film may be obtained, on its length, gauge, essential contents and, where known, suitability for particular audiences, especially schools. This is a most valuable pamphlet, the existence of which should be made widely known so that fuller use can be made by schools and other institutions of the extensive amount of available material.

Royal Institute of Chemistry Monographs for Teachers

No. 1: Principles of Electrolysis. By Prof. C. W. Davies. Pp. v+30. 3*s.* 6*d.* No. 2: Principles of Oxidation and Reduction. By Dr. A. G. Sharpe. Pp. v+30. 3*s.* 6*d.* (London: Royal Institute of Chemistry, 1959.)

EVERY student who goes up to university soon encounters the frustrating experience of having to 'unlearn' something of what he has been taught at school. There may well be something to be said for the educational value of varied approaches and the discarding, on the basis of more adequate arguments, of material acquired parrot-fashion at a younger age. There can be no doubt, however, that such lessons ought to be kept to a minimum and that time at school is in general more wisely spent on the teaching of fundamentals on a sound basis.

With this object in mind, the Royal Institute of Chemistry have now begun the issue of pamphlets on some of the more advanced topics of the school chemistry syllabus, to provide a short refresher course for teachers. The venture deserves every success and has had a good send-off with the two pamphlets issued so far.

V. GOLD

GENETIC BASIS OF THE THALASSÆMIA DISEASES

By PROF. V. M. INGRAM and A. O. W. STRETTON
Division of Biochemistry, Department of Biology, Massachusetts Institute of Technology, Cambridge, Massachusetts

IN recent years it has become clear that the abnormal human hæmoglobins, such as hæmoglobins *S*, *C*, *D*, *E*, etc., are variants of the normal protein (hæmoglobin *A*), differing from it by the substitution of perhaps not more than a single amino-acid residue by a new one[1]. These mutant forms are inherited as single genes. On the other hand, thalassæmia in both its minor and its major form, although inherited in a similar manner, has presented a much more complicated and confusing picture. In this anæmia, the inherited abnormality is not manifested in the production of recognizably abnormal forms of hæmoglobin, but rather in the apparent interference with the rate of production of the hæmoglobin *A* with consequent anæmia.

It is the purpose of this article to present and explore a unifying hypothesis—and an alternative—which seeks to explain the occurrence of thalassæmia and some of its interactions with the other hæmoglobinopathies in which chemically abnormal hæmoglobins are recognized. In particular, we wish to suggest that thalassæmia is a mutation producing a hæmoglobin with a 'hidden' amino-acid substitution, such that the hæmoglobin produced is electrophoretically normal. There are many such mutations possible. Some of the ideas which are contained in this theory have been talked about by many people and on numerous occasions (for example, Itano[2]); we do not wish to claim any great originality for them. It is hoped that the hypothesis, even if proved wrong, will serve to stimulate interest and direct experiment in this field.

Historical

Thalassæmia, or Cooley's anæmia, is a hereditary disease which occurs commonly in Mediterranean peoples, especially those of Italian and Greek origin. It is found in two forms, thalassæmia major, or Cooley's anæmia, and thalassæmia minor.

Clinically the major form of the disease is characterized by a marked hypochromic anæmia with abnormal red-cell morphology and the presence of target cells and oval red blood cells; the cells have increased mechanical fragility and osmotic resistance. The minor form, on the other hand, may be asymptomatic and in some cases is difficult to diagnose. Anæmia, if present at all, is only very slight; the hæmatological findings include increased target cells, microcytosis, and increased osmotic resistance of the cells.

Electrophoretic studies[3] and measurements of the rate of denaturation by alkali have shown that in the major form of the disease the proportion of a hæmoglobin having the mobility and behaviour of fœtal hæmoglobin is raised, sometimes as high as 97 per cent of total hæmoglobin. In the minor form the proportion of fœtal hæmoglobin is scarcely raised above the normal amount, which is of the order of 1 per cent. Rich[3] has suggested that fœtal hæmoglobin is produced to compensate for the marked decrease in the amount of normal adult hæmoglobin synthesized by people with thalassæmia major; if this is the case, it is apparent that the degree of compensation varies widely from individual to individual, as does the decrease in the rate of production of hæmoglobin *A*.

It is now well established that the parents of a person with thalassæmia major have thalassæmia minor, and extensive family studies have been carried out to support this[4]. However, cases have been reported where parents of thalassæmia major children do not show the usual findings associated with thalassæmia minor[5]. In addition to the increase in the proportion of fœtal hæmoglobin mentioned above, Kunkel[6,7] has recently shown a correlation between the proportion of a normal minor component of blood, hæmoglobin A_2, and the presence of a thalassæmia gene. Gerald and Diamond[8] have extended this in a survey of twenty-three parents of children with thalassæmia major. They found that in all these parents the proportion of A_2 is raised, the usual increment being from the normal 2.5 per cent to 5 per cent. However, Kunkel *et al*.[7] showed that two out of thirty-four parents of children with thalassæmia major had no increase in A_2, although examination of their blood suggested the presence of thalassæmia minor. This last finding suggests, as does the great variability of the disease, that there is not one kind of thalassæmia minor or major, but several and perhaps many.

Possible Molecular Mechanisms for Thalassæmia

The appearance of the cells in thalassæmia major suggests that they contain less hæmoglobin than normal. Perhaps such symptoms as are seen in the minor condition can be laid to this cause also. It is possible to explain the low hæmoglobin content in terms of a slower rate of hæmoglobin synthesis within the developing blood cell in a way similar to the explanation given by Itano[9] for the abnormal hæmoglobin diseases. If we assume that hæmoglobin synthesis is complete in all or almost all the cells in circulation, then the ratio of the amounts of different hæmoglobins in the same cell is equal to the ratio of their average rates of synthesis. In persons who are heterozygous for hæmoglobin *A* and for an abnormal hæmoglobin (for example, hæmoglobin *S*), the proportion of hæmoglobin *A* is usually higher than that of the abnormal, reflecting a lower rate of synthesis of the abnormal hæmoglobin. It has been suggested[9] that in cases of persons homozygous for an abnormal hæmoglobin or heterozygous for two abnormal hæmoglobins, the cells are microcytic and the blood contains numerous target cells. However, in sickle cell anæmia, the cells are normocytic, but this may be due to increased amounts of fœtal hæmoglobin in the cells. Since all the cells in sickle cell anæmia show the sickling phenomenon, even when hæmoglobin *F* is present, the synthesis of fœtal hæmoglobin and hæmoglobin *S* seems to occur within the same cells[10].

A slow rate of hæmoglobin synthesis in thalassæmia might be expected to result in hypochromic cells. We know of no direct experimental evidence on whether fœtal hæmoglobin produced in thalassæmia major is in the same cells as adult hæmoglobin; but arguing from the findings in sickle cell anæmia, we would predict that they would be in the same cells. Experiments are needed to confirm this prediction and to compare the sites of formation of cells containing fœtal hæmoglobin in the normal fœtus and infant, in sickle cell anæmia and in thalassæmia major.

Possible Causes of a Low Rate of Hæmoglobin Synthesis

If the gene affected in thalassæmia is one which controls the production of an enzyme catalysing one of the many steps involved in hæm synthesis, a low rate of enzyme synthesis or a defective enzyme might result in this particular enzymatic reaction being the rate-limiting step in hæmoglobin production. The high serum iron and the saturation of the iron-binding capacity of the plasma have been taken as indications that inhibition in porphyrin synthesis is the basic defect in thalassæmia. However, on this basis it would be expected that the rate of synthesis of fœtal hæmoglobin should also be reduced in thalassæmia, if indeed it is true that fœtal and adult hæmoglobin are made in the same cells.

In the normal infant, a switch-over mechanism exists which causes fœtal hæmoglobin production to be replaced completely by adult hæmoglobin production within a few months of birth. The nature of this control mechanism is not understood; but if it were defective, fœtal hæmoglobin synthesis might not be arrested, as it is in the development of the normal infant, while at the same time the synthesis of hæmoglobin A might remain partially or completely unstimulated. Thalassæmia, in this view, would be a developmental defect, resulting in a state of immaturity of the hæmoglobin-synthesizing system.

The two mechanisms discussed above might be expected to result in a low rate of synthesis of adult hæmoglobin, and it is quite possible that some cases of thalassæmia are, in fact, caused by one or other of them. However, there is one aspect of the effect of a thalassæmia gene that is difficult to explain in these terms: it is found that in many cases where both clinical and family studies suggest the presence of both a thalassæmia gene and a gene for an abnormal hæmoglobin (for example, hæmoglobin S) in the same person, the proportion of abnormal hæmoglobin is roughly doubled in comparison to that found in a person singly heterozygous for an abnormal hæmoglobin. For example, in sickle cell or hæmoglobin C trait, the abnormal hæmoglobin constitutes roughly 40 per cent of the hæmoglobin, whereas in double heterozygosity for thalassæmia and hæmoglobin S or C, the proportion rises to about 80 per cent. The remainder is largely fœtal hæmoglobin. This indicates a specific inhibition of hæmoglobin A synthesis with little or no interference with production of the abnormal hæmoglobin. This differential effect is difficult to explain, if thalassæmia involves an effect on hæm synthesis, or a defect in the hæmoglobin F to hæmoglobin A switch mechanism, both of which should, *a priori*, inhibit also the abnormal hæmoglobin.

Studies on the ratio of hæmoglobin A to hæmoglobin S and to hæmoglobin C in heterozygotes have led Itano[11] to postulate that as well as containing the information for the amino-acid sequence of the globin, the hæmoglobin genes also have characteristic rate-determining information; thus, a gene controlling the production of a globin with a certain amino-acid sequence will effect synthesis of protein at a certain rate, while a gene associated with a globin having the same sequence except for one amino-acid may have a different rate of synthesis. For example, hæmoglobins S, C and E appear to be produced at a slower rate, and hæmoglobin J[9] at a faster rate, than normal.

Itano has also postulated[2], on the basis of the trimodal distribution of ratios of hæmoglobin A to hæmoglobin S in heterozygotes, that normal hæmoglobin is controlled by a series of at least three alleles, producing hæmoglobin at different rates; the hæmoglobins would have different amino-acid sequences, but the same electrophoretic mobility. We wish to extend these ideas to include thalassæmia, postulating that the 'hæmoglobin A' found in thalassæmia homozygotes has a different amino-acid sequence from 'normal', and that this new sequence determines a characteristically low rate of synthesis. If in some cases of thalassæmia major no hæmoglobin A appears to be produced at all, we would assume it to be due to a 'lethal' mutation similar to those found in micro-organisms where a mutation within a gene may cause no protein to be produced; so far only one such thalassæmia case has been described[3].

Amino-Acid Substitution Hypothesis

There are in the human at least three types of hæmoglobin: (*a*) the adult series of hæmoglobins (A, S, C, D, E, etc.), (*b*) the fœtal series (F, hæmoglobin 'Alexandra', etc.), (*c*) the normal minor components—for example, hæmoglobin A_2 of Kunkel and Wallenius[12].

Each form of hæmoglobin has, or probably has, four polypeptide chains of two different kinds[13,14], which we may write Hb $A = \alpha_2{}^A\beta_2{}^A$, Hb $F = \alpha_2{}^{\text{‘}A\text{’}}\gamma_2{}^F$, Hb $A_2 = x_2{}^{A_2}y_2{}^{A_2}$ (to indicate that these have not yet been investigated). The subscripts have the usual chemical significance as in H_2O and the superscripts refer to the particular hæmoglobin. It has been shown that the α chains of hæmoglobin F are like the α chains of hæmoglobin A in gross structure[17,18]. When it is shown that they are alike in detail, then we will be able to write hæmoglobin $F = \alpha_2{}^A\gamma_2{}^F$. The possibility that these α chains are identical, and more important, the possibility that those chains are controlled by the same gene, are of great genetic, developmental and evolutionary significance. They also affect to some extent the hypothesis in this paper.

It is widely believed that the precise amino-acid sequence, and hence the structure, of each hæmoglobin peptide chain is controlled by a specific gene—with the proviso mentioned in the previous paragraph. For hæmoglobin A there would exist α genes to control α chains and β genes to control β chains. The genotype of a person making hæmoglobin A would be written as α^A/α^A, β^A/β^A. The idea that two sets of genes might control production of hæmoglobin has been proposed before by Schwartz *et al.*[19] and by Smith and Torbert[20]. The genotype for fœtal hæmoglobin, and for A_2, can be written $\alpha^{\text{‘}A\text{’}}/\alpha^{\text{‘}A\text{’}}$, γ^F/γ^F and X^{A_2}/X^{A_2}, Y^{A_2}/Y^{A_2}. The abnormal human hæmoglobins, in so far as they have been investigated, have proved to carry single amino-acid substitutions in one or other chain[1]. The molecule of the hæmoglobin S phenotype which has the mutation

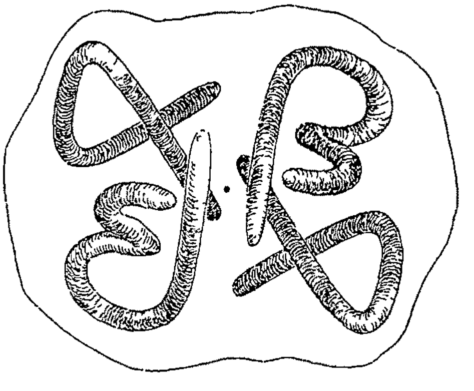

Fig 1 Schematic diagram of the spatial arrangement of peptide chains in the hæmoglobin molecule The sausage-like objects (ref 16) represent the coiled polypeptide chains which are of two sorts α peptide chains, beginning with the sequence valine-leucine, and β peptide chains, beginning with valine–histidine-leucine They are arranged about a two-fold axis of symmetry (according to Perutz *et al* , ref 15) perpendicular to the plane of the paper

in the β chain[21,23] is written as $\alpha_2^A\beta_2^S$ and the genotype as α^A/α^A, β^A/β^S and α^A/α^A, β^S/β^S for the heterozygote and homozygote, respectively Hæmoglobin *I*, which is an α chain mutation[21], would be written as $\alpha_2^I\beta_2^A$ and α^I/α^A, β^A/β^A in the heterozygote

It is an important feature of the chemical work of establishing the phenotype of the abnormal hæmoglobins that both forms of the genotype find their phenotypic expression The above sickle-cell heterozygote makes both hæmoglobin *A* and *S* This is not necessarily so and one can well imagine instances where the mutation might be so drastic or of such a nature that the phenotype—the corresponding chain —cannot be made We believe that some cases of thalassæmia may fall into this category

We wish to propose that, in its typical form, thalassæmia is a mutation of the α or the β gene of the adult series, in no way different from those mutations which lead, for example, to hæmoglobin *S* and *C*, except that the consequent amino-acid alteration does not change the electrophoretic behaviour of the hæmoglobin or that the alteration is so drastic that this particular chain is not made at all and therefore never observed So far we have confined ourselves to mutations which effect amino-acid substitutions at a point—point mutations It will be obvious that the above second class of alterations, leading to non-production of the chain, could also be caused by other types of mutations such as deletions, inversions and substitutions involving a considerable number of amino-acids

It is assumed for the time being that the four genes involved in, say, α^A/α^A, β^A/β^A, act independently and produce the chain peculiar to them Thus, the genotype α^I/α^A, β^A/β^S, if it existed, would produce $\alpha_2^I\beta_2^A$ = Hb *I* , $\alpha_2^A\beta_2^A$ = Hb *A* , $\alpha_2^A\beta_2^S$ = Hb *S* , $\alpha_2^I\beta_2^S$ = Hb *X* as yet unknown The elegant re-association experiments by Singer and Itano[22] and of Vinograd, Hutchinson and Schroeder[23] have shown that real hybrid molecules, such as $\alpha^I\alpha^A\beta_2^A$, for example, do not occur naturally and cannot so far be made *in vitro* It is also possible that a metabolic link exists between the α and the 3 gene derived from a particular parent, such that the genotype α^I/α^A, β^A/β^S makes only hæmoglobin *I* and hæmoglobin *S* There is as yet no definite evidence against this idea, but it seems to us unlikely

One important consequence of the theory is that thalassæmias, which have always been diverse in characteristics and distribution, can now be divided into two classes affecting the α and the β gene However, within each class, great diversity is just what one would expect, because the number of possible mutations leading to 'non-electrophoretic substitutions' must surely be very large They can differ in the particular amino-acid affected provided that such changes do not lead to alteration in electrophoretic behaviour, and consequently they can differ in the extent to which the rate of synthesis has been altered On this basis the 'thalassæmias' range from mutant forms which are almost indistinguishable from the normal, even by chemical examination, to those in which the mutation is so drastic—lethal—that the hæmoglobin is not made at all The genotypes of such thalassæmias might be written as α^A/α^X, β^A/β^X or α^A/α^A, β^X/β^A, with many different alleles. (Superscript '*X*' refers to the altered gene)

Although many such thalassæmias are theoretically possible, in practice they need not form a continuum Only some may be clinically important and therefore recognizable

One of the appealing consequences of the hypothesis is that it provides an acceptable explanation of the cases where the thalassæmia gene, when present together with a single hæmoglobin *S* gene, suppresses the formation of hæmoglobin *A* but not that of hæmoglobin *S*. Previous ideas which postulated that thalassæmia is a suppression of hæmoglobin synthesis have come up against the difficulty that this suppression can act selectively against hæmoglobin *A*, but not against the abnormal hæmoglobins such as *S*, *C* and *E* , this is in spite of the fact that each of these differed by only 1 out of 280 amino-acids[24] from hæmoglobin *A* and from each other We have always found such a situation difficult to visualize If, on the other hand, thalassæmia is a mutation of, say, the β gene, then a sickle cell-thalassæmia might have a genotype such as α^A/α^A, β^X/β^S This phenotype would not have the genetic equipment to make any hæmoglobin *A*, but would produce hæmoglobin *S* together with a reduced amount of $\alpha_2^A\beta_2^X$ (electrophoretically identical to $\alpha_2^A\beta_2^A$) As a compensating mechanism he would make hæmoglobin *F* ($\alpha_2^A\gamma_2^F$), which has γ chains instead of β chains Alternatively, the genotype might be α^X/α^A, β^A/β^S if the subject has an α chain thalassæmia In this case, synthesis of apparently normal hæmoglobin *A*, which is really $\alpha_2^X\beta_2^A$, might go on to a small extent in addition to production of hæmoglobin *A*, depending on the severity of the mutation Also the degree to which increased production of hæmoglobin *F* is allowed or required might be expected to be very different in this second case, assuming a common α gene for hæmoglobins *A* and *F*

If the same α gene controls the production of the α chains of hæmoglobin *F* and the α chains of hæmoglobin *A*, then individuals homozygous for severe α thalassæmias should not be found *In utero* they would have very low levels of hæmoglobin *F*, which would most likely prove fatal in the absence of any compensatory effect This conclusion implies that all patients with thalassæmia major are either homozygous for a β-chain defect, which would not interfere with the production of fœtal hæmoglobin, or that they are doubly heterozygous for α- and β-chain defects, or else that they have a defect of a different type

If it should be the case that Kunkel's hæmoglobin A_2 also has α chains, which are similar to those of hæmoglobins *A* and *F*, and if all these α chains are controlled by one and the same 'α gene', then the two types of thalassæmia would be expected to differ in the extent to which the A_2-level should be affected A β chain mutation would allow an increase in A_2 to occur, whereas an α chain mutation would not Such differences in the level of A_2 in different thalassæmias are known to exist Nevertheless it would probably be unwise to throw out entirely the notion that thalassæmia can act as a general suppressor of hæmoglobin synthesis The disease exists in so many varied forms that some of them may be of this type We are postulating that the majority of thalassæmias fall into the class described by the 'substitution' hypothesis

Application of the Hypothesis

Silvestroni and Bianco[25] describe two families including a member having 'microdrepanocytic disease'—or sickle cell-thalassæmia disease (see Fig 2)

The genotypes were deduced from hæmatological examinations, details are not given in the paper, so the phenotypic expression of the thalassæmia gene in the thalassæmia minor cases is not known, the proportions of different types of hæmoglobin were not measured We notice two marriages involving a person heterozygous for both thalassæmia and sickle cell trait In one case ('family 6', Fig 2), such a man when married to a normal woman has a doubly heterozygous child, and in the other case ('family 9', Fig 2) when married to a woman with thalassæmia minor has a normal child The S change is known to occur on the β chain of hæmoglobin[21,23] and we assume this to be a case of the same hæmoglobin S These patterns of inheritance and the other statistics presented by the authors suggest that the gene for thalassæmia and the gene for sickle cell anæmia in these double heterozygotes are non-allelic and the pattern of inheritance can be explained as follows by assuming the thalassæmia to be of the α variety (Fig 3) Since we cannot deduce whether the mother of 'family 9', who has thalassæmia minor, has an α or a β thalassæmia, the child with thalassæmia major in this family could either have two α gene defects, or an α and a β defect If the genes produce the appropriate chains independently, we would expect the double heterozygotes α^X/α^A, β^A/β^S to produce hæmoglobin A in addition to S The reported data are not sufficient to corroborate this deduction

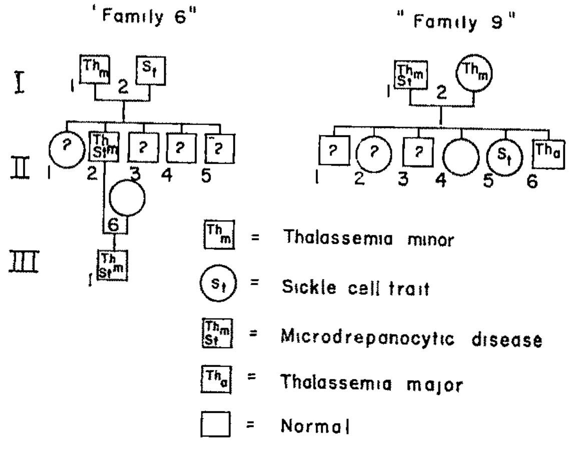

Fig 2 Phenotypes of the living members of two of the families studied by Silvestroni and Bianco (ref 25)

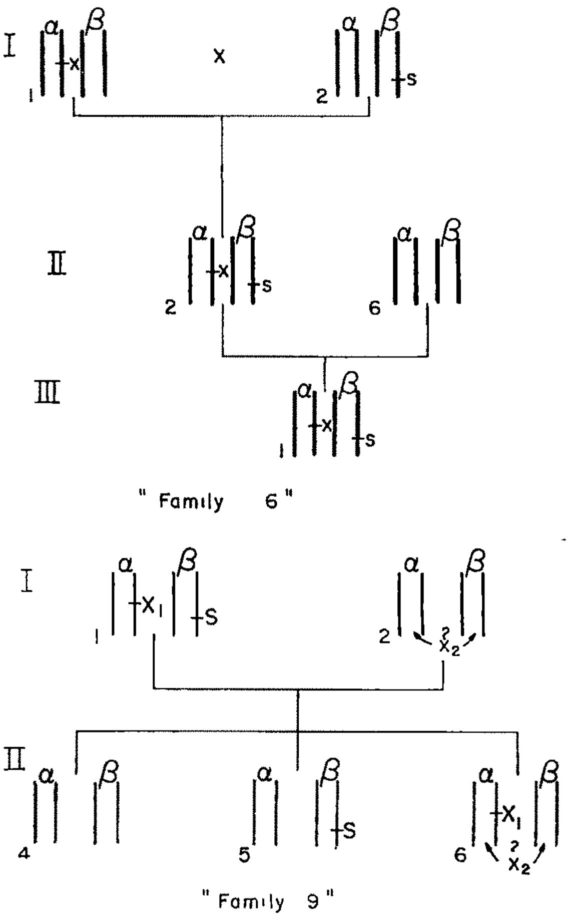

Fig 3 Genotypes of the families shown in Fig 2, but including only individuals with known phenotypes The vertical lines represent the α and β hæmoglobin genes as marked + S denotes the sickle cell mutation, and + X the thalassæmia mutations

Neel[26] described a family where a normal person and a person who appears to be heterozygous for both sickle cell anæmia and thalassæmia have two apparently normal children, one child and possibly a second with thalassæmia minor, one and possibly a second with sickle cell-thalassæmia disease, and one child with sickle cell trait In order to explain this in terms of the two hæmoglobin genes, the thalassæmia defects must in this case be on the α gene, this family, 'kindred 60' (Fig. 4), provides evidence for the idea that this thalassæmia is on the α gene, while the hæmoglobin S mutation is on the β gene The last series for sickle cell-thalassæmia disease are three families described by Ceppellini[27], where the children of a normal person married to a person with sickle cell-thalassæmia disease are either thalassæmic or have sickle cell trait In one family of seven, three children have sickle cell trait and four have thalassæmia minor, while the other two families include three children each, and in both cases two have sickle cell trait and one has thalassæmia minor In these three families involving thirteen children, six have thalassæmia minor and seven have sickle cell trait, which suggests that the thalassæmia defect is in these cases on the hæmoglobin β gene, like hæmoglobin S, since all the children inherit either sickle cell trait or thalassæmia minor, with equal probability; it is, of course, impossible to reach definite conclusions using such small numbers The critical family of Schwartz *et al* [19], which includes cases of hæmoglobin *S* and *G* as well as thalassæmia, is under re-evaluation and will not be discussed here

Hœmoglobin H It was recently reported[28] that hæmoglobin *H* is composed of four polypeptide chains, but that these are all of the β variety This agrees well with the physical behaviour and the instability of this hæmoglobin

According to Motulsky[29], such cases occur together with thalassæmia minor in the family, and therefore it was postulated that "hæmoglobin *H* is only shown electrophoretically in the presence of thalassæmia" On the other hand, Bingle *et al* [30] have reported hæmoglobin *H* without apparent thalassæmia

Taking the first cases, two explanations are possible If it is true that the β chains of which hæmoglobin *H* is composed are in every detail normal, then we may postulate that hæmoglobin *H* occurs where two mild α thalassæmias occur together (Fig 5*b*) One of these might be so mild as to be not noticeable until together with the other The genotype $\alpha^{X_1}/\alpha^{X_2}\ \beta^A/\beta^A$ would manufacture a large excess of β chains which complex to form $\beta_4{}^A$ = hæmoglobin *H* In Fig 5*a* the person III 1 shows hæmoglobin *H* and II 3 and III 4 show thalassæmia In the alternative explanation, the hæmoglobin *H* β chains might have a non-electrophoretic change such that production of this chain is increased or such that when the proportion is increased due to an α thalassæmia, the β^H chains polymerize preferentially In this case the genetic picture would be as shown in Fig 5*c*

In two families described by Fessas[32], hæmoglobin *H* is transmitted from father to son, showing that the genes for hæmoglobin *H* and thalassæmia cannot be allelic, since they are both inherited from one parent In these cases, the second explanation, namely, that a non-electrophoretic change in the β chain allows a preferential polymerization of excess β chains, must be preferred

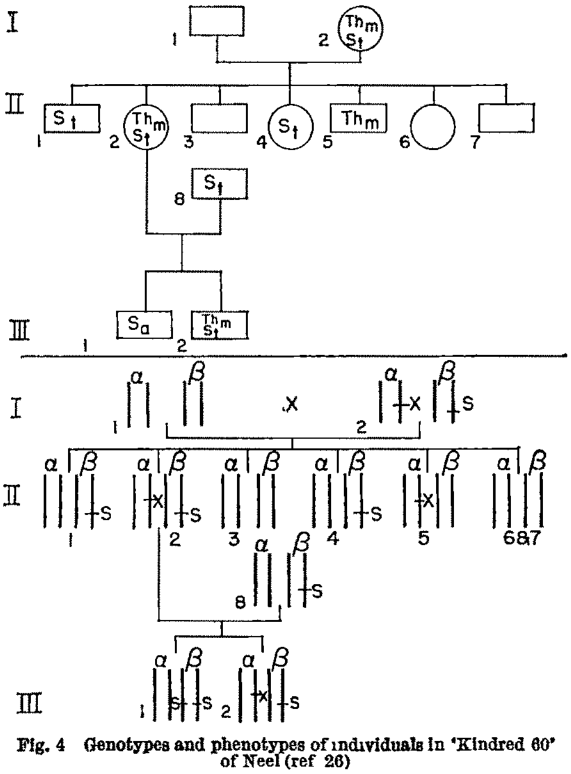

Fig. 4 Genotypes and phenotypes of individuals in 'Kindred 60' of Neel (ref 26)

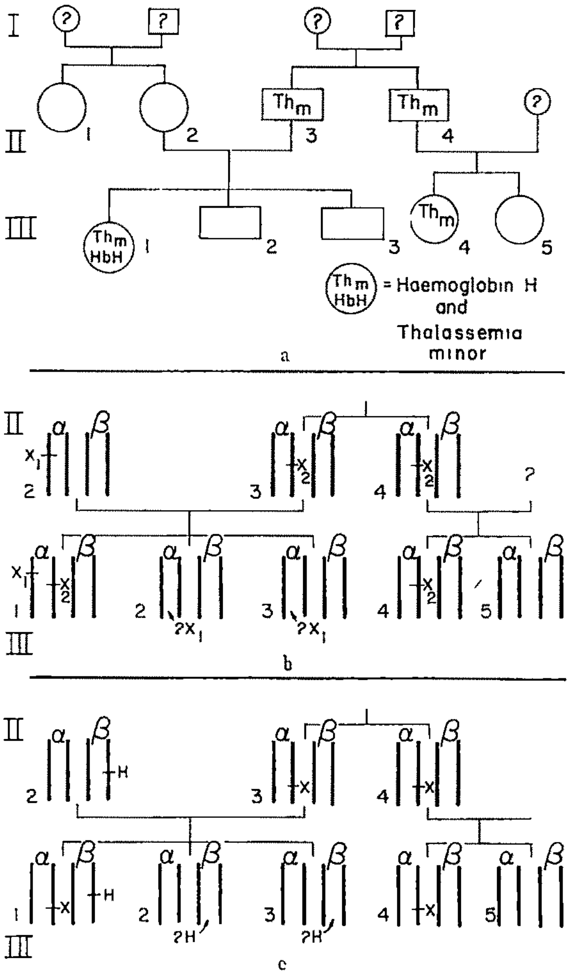

Fig 5 Family described by Gerald (ref 31) illustrating the inheritance of hæmoglobin *H* *a* = phenotypes, *b* and *c* = the two patterns of inheritance discussed in the text

It might equally be expected that a hæmoglobin composed of four α chains could be produced in circumstances similar to those leading to formation of hæmoglobin *H*, namely, the presence of two mild thalassæmia genes affecting the rate of synthesis of β chains, thus

$$\alpha^A/\alpha^A,\ \beta^{X_1}/\beta^{X_2} \rightarrow \alpha_2{}^A\beta_2{}^{X_1} + \alpha_2{}^A\beta_2{}^{X_2} + \alpha_4{}^A$$

Alternatively, an altered α gene might produce an α chain which could polymerize to give $\alpha_4{}^A$, if α chains tend to be produced in excess due to thalassæmia

Discussion

Consideration of the families of patients with sickle cell-thalassæmia disease in terms of the hypothesis that the hæmoglobin gene is really two genes has led us to conclude that the thalassæmia defect, producing a hæmoglobin having the same electrophoretic mobility as normal hæmoglobin, but at a reduced rate, may in some cases be located on the hæmoglobin β gene (Fig 6, case 1), and in other cases is on the hæmoglobin α gene (Fig. 6, case 2)

In case 1, since both copies of the hæmoglobin β gene are altered, one copy producing an electrophoretically distinct polypeptide chain, and the other

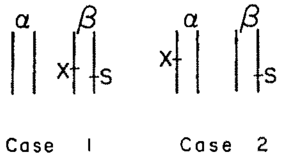

Fig. 6. The two possible genotypes to be expected in sickle cell-thalassæmia disease

producing a pseudo-normal chain but at a greatly reduced rate, it might be expected that the proportion of hæmoglobin S to 'normal' hæmoglobin should be higher than in the case of sickle cell trait; this is observed in most cases.

In case 2, however, one copy of the hæmoglobin α gene and one copy of the hæmoglobin β gene are quite unchanged, so the proportion of hæmoglobin A would be expected to be higher than that of hæmoglobin S, if $(\beta^A)_2$ is produced at a higher rate than $(\beta^S)_2$ as we have supposed. It is significant that in the case of Neel's family (kindred 60) where the genotype can be deduced to be type 2, the proportion of hæmoglobin S, as determined by later analyses, is 22, 28 and 36 per cent in three individuals, in contrast to 60–80 per cent found in other cases of sickle cell-thalassæmia disease[34]; further data on this point are needed. Furthermore, re-examination of this family[33] (kindred 60) has shown that the A_2-level was not elevated in individuals where the presence of a thalassæmia gene has been deduced. If A_2 has an α chain and the α gene responsible for its production is identical to that of hæmoglobin A, such an α thalassæmia would not be expected to allow the proportion of A_2 to rise, whereas a β thalassæmia, while decreasing the rate of synthesis of hæmoglobin A by lowering the rate of synthesis of β chains, should allow the level of A_2 to rise, if the α chains only are common.

In this connexion it is interesting to note that in two cases of thalassæmia-hæmoglobin C disease, where the genetic data are insufficient to establish the probable genotype, in one family hæmoglobin C is present to the extent of 74–77 per cent[35], while in the other family it comprises only 29 per cent[36] of the total hæmoglobin. This difference in interaction of the two genes may be due to the presence of different thalassæmia genes in each case, one on the hæmoglobin β gene and the other on the hæmoglobin α gene, respectively, as postulated for different cases of sickle cell-thalassæmia disease.

Further examination[37] of the second family in the previous paragraph, where the thalassæmia is of the 'non-interacting' kind, showed that the parent from whom the thalassæmia gene was transmitted did not have an elevation of A_2. This was also true of other children of the same parent, who also showed all the other characteristics of thalassæmia minor. On the other hand, persons with thalassæmia minor in the first family, with the 'interacting' type of thalassæmia, showed in the original electrophoretic patterns an 'unidentified component', later identified as hæmoglobin A_2 (ref. 38) at levels of 6–7 per cent.

It would be interesting to investigate the proportion of hæmoglobin A_2 in individuals with thalassæmia minor in these families where different sorts of genotypes are proposed. In many cases of thalassæmia minor, the level of A_2 is roughly doubled, as is usually the case with the level of abnormal hæmoglobin in double heterozygotes; it is possible that α and β thalassæmias may differ by allowing or not allowing the proportion of A_2 to rise in compensation.

In this connexion the findings of Kunkel *et al.*[7] where parents of children with thalassæmia major were found having A_2-levels within the normal range are very interesting.

It is also important to remember that cases of parents of children with thalassæmia major have been found who carry none of the characteristics of thalassæmia minor, so apparently normal people may, in fact, carry a thalassæmia gene[6,39].

This hypothesis as to the possible genetic and molecular mechanism involved in thalassæmia is open to experimental test; it would predict that in cases of thalassæmia major the hæmoglobin having the same mobility as hæmoglobin A has a different amino-acid sequence, possibly bearing the same relationship to normal hæmoglobin as do the established 'abnormal' hæmoglobins that have been studied in detail; namely, a difference in one amino-acid. Such a difference might be detected by analysis of the amino-acid composition of peptides of hæmoglobin A from normal and thalassæmia major subjects.

It may be that the wide variability in expression of thalassæmia is due to the possibility of the simultaneous presence of different types of genetic defect. For example, the genotypes α^{X_1}/α^A, β^A/β^{X_2} and $\alpha^{X_1}/\alpha^{X_2}$, β^A/β^A might lead to different phenotypic expressions and to different severity of the disease. Bearing in mind the further possibility of a defect in hæm synthesis, or other abnormalities, a wide spectrum of clinical states might be expected.

An Alternative: the 'Tap' Hypothesis

Freese[40] put forward the concept of chromosome structure in which genetically significant deoxyribonucleic acid alternates in a linear arrangement with 'connecting units'. Based on this idea, we can construct a second hypothesis to explain the occurrence of thalassæmias. Freese's 'connecting units' could be made of protein or of deoxyribonucleic acid and the structure of these units, if protein, could be determined by a small part of an adjacent deoxyribonucleic acid template. It might be further assumed that these connecting units serve to activate or inactivate the genetic deoxyribonucleic acid which follows them. In the case of the β chain gene, it might happen that a defect in the connecting unit preceding it results in this gene remaining silent. Therefore, β chains are not made and a β chain thalassæmia results with its deficiency in hæmoglobin. Such a defect would be genetically controlled by an adjacent region of deoxyribonucleic acid, sufficiently close to the β chain gene to be indistinguishable by the presently available data in human genetics. A similar picture would hold in the case of α chain thalassæmias. The defect in activating the α or β chain genes might be expected to range from zero to complete shut off, producing a number of intermediate steps. This explanation in which the 'tap' is turned off differs fundamentally from the one presented in the previous sections, because here the α or β chain genes are assumed to be perfectly normal. It is merely the degree to which they are activated that is affected. When, under the 'tap' hypothesis, a chain is made at all, its amino-acid sequence would be normal, even if it is made more slowly. On the previous hypothesis, the 'substitution' hypothesis, the chain when made is expected to carry one or more amino-acid substitutions or deletions. The genetic analysis presented in the preceding section is valid in terms of both hypotheses since the gene and its 'tap' would be very closely linked We have chosen to develop the 'substitution' hypothesis in greater detail because it is based on fewer assumptions than the 'tap' hypothesis

Summary

We propose that thalassæmia is a mutation of either the α or the β hæmoglobin gene, of the same kind as that observed in the abnormal adult hæmoglobins, but without effect on the electrophoretic behaviour of the protein Such mutations would be expected to reduce, sometimes to nothing, the rate of production of that hæmoglobin

We are grateful to Dr Park Gerald, Boston, and Dr H Lehmann, London, for the help of many stimulating discussions We wish to express our thanks to the Medical Foundation, Inc , Boston, for a grant, and to the National Institutes of Health for a fellowship (A O W S)

INTERNATIONAL MINERALOGICAL ASSOCIATION

FIRST GENERAL MEETING

MINERALOGISTS from nineteen countries assembled in Zurich at the end of August to attend the first meeting of the International Mineralogical Association and afterwards to go on one of the two field excursions Many of those present had also attended the foundation meeting of the Association at Madrid in April 1958 There it had been laid down that the Association shall be an association of national mineralogical societies and pursue the aim of furthering the cause of mineralogy in all its aspects To effect this, technical problems confronting mineralogists will be dealt with by special commissions, while scientific matters will be treated in symposia and eventually in publications sponsored by the Association The commissions (at present numbering four) proceeded to deal with questions relating to abstracts, new minerals, mineral data and museums, while at business meetings the statutes of the Association came up for discussion and amendment Two symposia were held of which a brief account will be given here The papers will be printed *in extenso* in a coming volume of the *Estudios Geologicos* published by the Instituto "Lucas Mallada" in Madrid

Alpine Mineral Fissures

The first symposium, held under the chairmanship of Prof E Wenk (Basle), dealt with Alpine mineral fissures To these may be assigned numerous occurrences in Switzerland and also some in quite different regions Prof R L Parker (Zurich) outlined the main features of these deposits as shown by the Swiss localities Though deservedly called "Alpine", the distribution in the Alps of such occurrences is localized and restricted to areas in which the interplay of mechanical forces and strength properties of the rocks is suitably balanced The resulting fissures are late- to post-tectonic in formation and filling and show no prolongation in depth They contain varied mineral assemblages which are considered to have crystallized from solutions deriving their contents from the surrounding rocks The belief that this process (known as lateral secretion) was widespread in the Alps is supported by the quite general dependence of the fissure contents on the character of the country rock and frequently also by the presence around fissures of a zone of leached rock which seems to have been the source of the matter now contained in the crystallized minerals of the fissure Among these, quartz and adularia are practically ubiquitous

The relationship of Alpine fissure minerals to those of the druses in the granite of Baveno was discussed by Prof G Fagnani (Milan) That such a comparison may be made is shown by the numerous minerals common to both types of occurrence These include not only widespread species such as quartz and orthoclase but scarcer ones also, and even some like gadolinite and bazzite that are rarities in central Europe. In spite of such similarities, the Alpine fissures and the Baveno geodes actually have little in common. Even the minerals occurring in both show differences in habit which reflect the differing modes of formation. This is especially true of orthoclase, which in the Alpine fissures is always developed as adularia which never appears at Baveno. The Baveno quartz, though well crystallized, lacks the wealth of forms prevalent in the fissures and never shows the Ticino habit with large acute rhombohedra found in some Swiss occurrences. A significant paragenetic detail is the appearance of zinnwaldite instead of muscovite as chief mica of the geodes.

Dealing with the origin of quartz as a fissure mineral of the Alpine type in the U.S.S.R., Prof. D. P. Grigoriev (Leningrad) stated that numerous mineral occurrences in the Soviet Union are assigned to the Alpine type of fissure deposit. A reason for doing so is the possibility of establishing definite connexions between the country rock and the mineral parageneses found in the veins and cavities in question. Analytical results obtained on unaltered country rock and on altered specimens from the veins provide corroborative evidence. As a special instance of Alpine-type mineral genesis, Prof. Grigoriev discussed the derivation and crystallization of quartz found in veins which are younger than the quartzite rocks in which they occur. Many of the observed peculiarities of Alpine quartz relating to crystal habit, distortion, aggregate development, distribution, etc., have been traced to and explained by such factors as the number, distribution, and exposure of seed crystals, and the physical state of the circulating solutions, which may be saturated in respect to the large seed crystals of quartz while still unsaturated as regards the small ones. The relative rates of crystallization of different minerals were also discussed and prove to be characteristic for a given locality though varying strongly from place to place.

Prof. M. A. Kashkai (Baku) showed that in the Caucasus Mountains (which possess many points of similarity to the Alps) mineral deposits frequently occur which, judged by the applicable criteria, must be considered to be of a nature and formed by processes akin to those of the Alpine fissures. Emphasis was laid on the wide distribution of so-called 'listvenites', which are metamorphic rocks consisting chiefly of quartz, carbonates, and chlorite besides numerous accessory constituents. As these are sometimes formed from hydrothermal solutions, relationships between them and deposits of Alpine type can be established.

Prof. J. Lietz (Hamburg) described experiments he has carried out on small cubes of colourless quartz designed to convert them into smoky quartz by electrolysis. The cubes are placed between electrodes and treated in an electric field of 200–1,500 V./cm. at temperatures of 700°–900° C. The arrangement of the electrodes fundamentally affects the results obtained. When the crystallographic axis of the crystal lies in the direction of the field and each electrode completely covers one side of the cube, a front of colour appears at the anode and migrates towards the cathode, thus progressively filling the entire cube. However, when the front has reached the cathode, the cube starts losing colour at the anode and finally becomes colourless again. When the anode only partially covers one side of the cube, the portion of the latter lying immediately in front of the anode is coloured and discoloured as just described, whereas that part of the cube not covered by the anode also assumes an intense dark colour which does not disappear and proves to be thermally stable up to 1,000° C. The phenomena agree well with the assumption that colour centres exist in the quartz lattice in the form of ($AlO_{4/2}$) tetrahedra which yield an electron when electrolysed.

Prof. F. Laves (Zurich) spoke on the feldspars of the Alpine fissures and their twinning. While the twins of adularia (potassium-feldspar with up to 10 per cent sodium) consist of a restricted number of individuals, albite (translucent sodium-feldspar) tends towards polysynthetic twins comprising many individuals. Such twinning may be the result of diffusive changes in the distribution of aluminium and silicon in the lattice or of displacive transformations due to a temperature-conditioned collapse of the structure. However, polysynthetic twins sometimes result from mechanical deformation when the distribution of aluminium and silicon is sufficiently disordered. The more opaque milky white variety of albite elongated after the *b*-axis and known as pericline is twinned according to a law usually defined as a rotation of 180° about the *b*-axis. Investigations show, however, that structural changes must have taken place after twin formation and be the reason why the inter-relation between the crystals only approximates to this law, the 'twin axis' being actually an irrational direction in (001). Leaching of a primary anorthite content and its partial metasomatic replacement by albite substance is a reason for this condition and causes numerous minute voids within the crystals. This accounts for their milky appearance.

Twinning of Crystals

The second symposium, the chairman of which was Prof. Martin J. Buerger (Cambridge, Mass.), had as its topic the twinning of crystals. Prof. Buerger's own paper was devoted to various aspects of twinning in general but with special regard to the boundaries between the twinned individuals. While the low energy of such junctions is quite generally a most characteristic feature of twins, the latter may be connected either by coherent or incoherent boundaries. A common type of coherent twin results from simple or more general stacking faults in the structure. Ex-solution pairs, however, always have incoherent boundaries. According to Prof. Buerger, twins related by 3-fold, 4-fold and 6-fold rotations are certainly possible.

Dr. H. Curien (Paris), discussing the degree of symmetry which a twin axis may possess, recalled the belief held by Georges Friedel that twin axes may be of a 2-, 3-, 4-, or 6-fold character. Examining each of these possibilities, Dr. Curien considers unlikely those involving 3- or 6-fold rotations, for these could not bring about any strict coincidence of lattice planes belonging to the two participating crystals. An example believed by Friedel to exemplify twinning by such an operation is the sagenite twin of rutile in which three crystals seemingly occupy positions realizable by a 60° rotation around the *a*-axis. However, this grouping can be accounted for by supposing the well-known twin laws of rutile (reflexion on (011) and (031)) to be both operative. They lead to positions deviating by only 10′, that is, by an amount within the experimental error, from the theoretical hexagonal positions. Dr. Curien accepts the possibility of twinning according to 4-fold axes

These will be oriented along lines of intersection between perpendicular planes present in all systems except the triclinic Such axes will, however, not produce actual coincidence of the nodes of the lattice planes, so that the 'quality' of such twins must be much inferior to that of ordinary ones

Prof J D H Donnay (Baltimore) proceeded from the fact established by Georges Friedel that a crystal twins whenever there is a superlattice that has (rigorously or approximately) more symmetry than the actual lattice of the crystal Similarly, it seems that the presence of an appropriate sub-lattice may lead to twinning It was then shown that twinning may also be explained in terms of the 'lattice complex' of Paul Niggli This term is applied to the assemblage of all like atoms in a structure independently of its position in the space group When such a complex of atoms has more symmetry than the space group as a whole, the remaining atoms can distribute themselves in various ways which are related by symmetry operations belonging to the complex but not to the space group These are the operations by which certain types of twinning are achieved

Dr P Hartman (Groningen) spoke on the twin of atacamite, the law of which is definable either as a 120° rotation about the [950] direction or as one of 180° about [544] The structural explanation lies, according to Dr Hartman, in the parallelism of chain links in the structure and not of lattice rows as in ordinary twins This, however, recalls the manner in which crystals of different species sometimes grow together in oriented pairs This phenomenon is known as epitaxy, and Dr Hartman suggested that very close relationships exist between it and twinning This would imply the non-existence of 3-, 4-, and 6-fold twin axes

Dr W T Holser (La Habra, Cal) analysed the relations of symmetry and structure at the boundary plane of a twin, extending his investigation to include trans-boundary relations He re-described Buerger's model of a trans-boundary growth step as a particular type of screw dislocation Twin stability is related to some measure of fit along the dislocation of the step, which latter may be symmetrical or pseudo-symmetrical

Prof T Ito (Tokyo) spoke on twinning as a building principle of crystals and introduced the new concept of 'space groupoids' as distinct from space groups

Dealing with twinning in diamond, Prof A Neuhaus (Bonn) first summarized some of the conflicting observations made on this mineral As a result of his own investigations, he considers it certain that a transition between two modifications takes place but believes that only one is isometric He assigns this one (α-diamond) to the O_h crystal class while attributing rhombohedral (D_{3d}–) symmetry of pseudo-isometric character to the other (β-diamond) Coarsely lamellated diamond seems to have evolved by natural tempering from such material showing finer alternations and arising from the transformation of the original isotropic substance Thus a distinction must be made between the true double-refraction of β-diamond and irregular effects due to strains produced by (sub-) microscopic inclusions Primary α-diamond is stable at high pressures and temperatures above 1,500° K , whereas β-diamond is stable at lower temperatures Natural diamonds always belong to the β-modification and may either have been formed as such from the outset or be the result of a secondary α-β transformation In either case twin lamellæ will be present which are primary in one and secondary (mimetic) in the other Prof Neuhaus demonstrated a new phase diagram of carbon from which conclusions regarding the stable formation of diamond can be drawn and the differences between Type-1 and II diamonds explained

Dr I Sunagawa (Tokyo) described the growth and natural etch patterns observed with a phase-contrast microscope on the boundaries of hematite crystals forming contact twins after $(10\bar{1}0)$ The surface structures of the twin boundaries are difficult to explain as simple junctions in twin position effected during growth It seems, rather, that the mechanism of contact twinning involves processes of faulting or slipping of the participating lattices

ROBERT L PARKER

SCHOOL OF PHYSICS WITHIN THE UNIVERSITY OF SYDNEY

THE research activities and student numbers of the School of Physics within the University of Sydney, the head of which is Prof H Messel, have expanded so much during the past six years that a major reorganization has become necessary

Henceforth there will be five departments within the School , the newly created departments are (1) The Basser Computing Department , (2) The Daily Telegraph Theoretical Department , (3) The Falkiner Nuclear Department , (4) The Wills Thermonuclear Department , (5) The Chatterton Astronomy Department

The Basser Computing Department arises from the Adolph Basser Computing Laboratory with the electronic digital computer, *Silliac* I This computer has been a great success in Australia and largely responsible for opening up the computing field there Opened on July 1, 1956, *Silliac* I has run at high reliability since that date, and at present is occupied 24 hr a day on a three-shift basis Work has or is being carried out for every University in Australia, two in New Zealand, for 20 government and semi-government organizations and 87 private organizations Some two hundred personnel throughout the country have attended courses on the computer and a postgraduate diploma course in automatic computing has been established

Steps are now being taken to proceed with the construction of a much faster transistorized machine. *Silliac* I was constructed using the University of Illinois design of *Illiac* The new computer in the Basser Department is likely to use the design of the new fast computer at present being built by the Illinois group The present cost is estimated at £A 575,000 These funds have still to be provided

Dr John M Bennett is in charge of numerical analysis and the user end of *Silliac* I, while Mr B E. Swire is chief engineer

The Daily Telegraph Theoretical Department was established with a gift of £A 50,000 from Consolidated Press, Ltd The theoretical group which forms the basis of the newly created department always has been a strong one The appointment of Prof S T Butler to the chair of theoretical physics should do much to enhance the position of the Department Work in the Department is centred on nuclear, solid-state, low-temperature, shower and field theory

An original gift of £A 50,000 by Dr G B S Falkiner was used to establish the F B S Falkiner Nuclear Research Laboratory in memory of his father This Laboratory, with twenty scientists, has been working during the past six years on various aspects of cosmic radiation and forms the basis of the new department At present there are two large groups One is specializing in the use of nuclear emulsions for the study of the primary cosmic radiation and high-energy jets, the second group is concerned with a large-scale study of extensive air showers

Considerable expansion of the efforts within the Department have taken place since the appointment of Prof C B A McCusker as leader of the cosmic-ray team of workers Further expansion in the work of both the emulsion and extensive air shower groups is taking place at present

The equipment from the large Culham air shower experiment which was run by the Harwell group in England arrived in Australia earlier during the year and has now been integrated into the former air shower experiment in Sydney The American Air Force in Texas has recently flown £5,000's worth of nuclear emulsion for the emulsion group to a height of 126,000 ft Balloons of 3,000,000 cu ft capacity were used The flights were made gratis The emulsion is to be processed in Chicago using the large developing facilities available in Prof Marcel Schein's group

The Wills Thermonuclear Department is a new one and has been made possible by a gift of £A 50,000 from W D and H O Wills (Australia) Ltd in Sydney The gift will be used for providing some of the initial research equipment required by the Department The creation of a thermonuclear department in the School is in keeping with recent developments overseas in the thermonuclear field, where there has been a marked tendency for the research effort to swing back from large-scale engineering attacks to work of a more fundamental nature and on a smaller scale It will also allow Australia to partake from an early stage in this exciting field of research

The appointment of Prof C N Watson Munro, chief scientist of the Australian Atomic Energy Commission, to the chair of thermonuclear physics is in keeping with his experience in the nuclear field He was one of the pioneers in the nuclear reactor field and it is his wish now to try to pioneer some of the work in the thermonuclear field

The Chatterton Astronomy Department will have two groups One group will use a 40-in reflecting telescope with auxiliary photoelectric equipment to consider problems in astronomy, the interpretation of which relies heavily upon physics The contract for the instrument will be placed during 1960 and the instrument should be installed during 1961 Total initial cost of the project will be around £A 100,000 The site for the instrument has still to be determined, but is highly likely to be situated at a joint Mount Stromlo–Sydney School of Physics field station A survey for the site is at present being carried out by the Mount Stromlo group

The second group will in the first instance be concerned with work using an intensity interferometer (at a later date a general interferometry group will be built up) This instrument, the first of its kind to be built, is based upon the work of two British scientists, Mr Hanbury Brown of the University of Manchester and Dr R Q Twiss, who is a member of staff of the Chatterton Astronomy Department The instrument will be used for measuring the temperature and diameter of stars—both very important quantities in astrophysics

The contract for the instrument has been let in England and the interferometer will arrive in Australia towards the end of 1960 The site for the field station at which the instrument will be erected is likely to be at Narrabri, New South Wales—about 370 miles north-west of Sydney Initial cost of the project will be in the neighbourhood of £A 175,000 Initial funds for work in the Astronomy Department were provided by a grant of £A 50,000 from Mr Stan Chatterton, a prominent member of the Nuclear Research Foundation within the University of Sydney

It will be noted that the five new departments within the School of Physics form an integrated research effort The work of all the departments is closely linked and has been chosen with that purpose in mind It should allow Australia to make an ever-increasing contribution to furthering new knowledge in these fields

The Nuclear Research Foundation within the University of Sydney has been responsible for the provision of the major funds for the research effort in the School of Physics A sum approaching £A 1,000,000 has been raised in various ways during the past six years

OBITUARY

Dr H H Potter

THE death is announced of Dr Harold Herbert Potter, lecturer in physics in the University of Bristol from 1924 until his retirement last summer owing to ill-health Dr Potter was a graduate of Bristol, who spent four years at King's College, London, as the holder of an 1851 Exhibition before returning to Bristol At King's College, under O W Richardson, he carried out accurate measurements on the proportionality between mass and weight, and showed that the ratio is independent of the nature of the material within an experimental error of fifteen parts in a million

To workers in the field of magnetism, Potter was well known for his investigations in Bristol in the field of ferromagnetics, both in collaboration with Sucksmith and independently between the two World Wars This work included specific heat measurements through the Curie point, the magnetic properties of single crystals and their correlation with crystal structure, including Heusler and other magnetic alloys, and the electrical resistivity of nickel and iron from 20° to 1,200° K

As an experimenter, Potter's work was careful, reliable and important in its period, it will also stand the test of time In addition, he was a keen, effective and popular teacher of undergraduates

He leaves a widow but no children

NEWS and VIEWS

Chemistry at Bedford College, London.

Prof. E. E Turner, F R S

THE retirement is announced of Prof E E Turner, head of the Department of Chemistry at Bedford College, University of London Prof Turner received his early education in the Coopers' Company School, in Queen Mary College, and in Sidney Sussex College He was assistant (chemical warfare research) to Sir William Pope, and he also served in the Research Department, Royal Arsenal, Woolwich His first teaching appointments were in the University of Sydney and in Queen Mary College Later, he was reader (1928–44) and professor (since 1944) at Bedford College, University of London He is a Fellow of Queen Mary College, Freeman of the City of London, and Liveryman of the Coopers Company He was elected to the fellowship of the Royal Society in 1939 Prof Turner has made most distinguished contributions to research in organic chemistry, including especially stereochemical problems, such as molecular dissymmetry dependent on restricted rotation about a single bond in diphenyl and other compounds, asymmetric synthesis and transformation He is joint author (with Margaret M Harris) of a well-known text-book of organic chemistry Prof Turner's services to chemistry in many fields are far too numerous to mention, to give but one example, his colleagues in the University of London recall with pleasure and gratitude his many years of service on the Board of Studies in Chemistry, first as secretary and later as chairman

Prof P. B D de la Mare

DR P B D DE LA MARE, who is to succeed Prof Turner, was educated at the Hamilton High School and Victoria University College, New Zealand His interest and flair for research in physical–organic chemistry was first shown in important papers, in collaboration with Prof P W Robertson, on the addition of halogens to olefins Following his degree work at Wellington, he was directed for national service to the New Zealand Government Department of Agriculture, where he worked on problems of nutrition and the chemistry of lipids with Dr F B Shorland During 1946–48 he held a University of New Zealand fellowship at University College, London, and he was awarded the Ramsay Memorial Medal in 1948 Since that time he has been a member of staff of University College, where he is at present a reader in chemistry He has made most notable contributions to the study of addition, substitution and re-arrangement processes in organic chemistry He is a co-editor, with Dr W Klyne, of "Progress in Stereochemistry", vol 2, and a co-author, with Dr J H Ridd, of "Aromatic Substitution—Nitration and Halogenation" He is a member of the Publications Committee of the Chemical Society and of the Joint Library Committee It is evident that the established traditions at Bedford College will continue to grow under Dr de la Mare's direction

Pierre Joseph van Beneden (1809–94)

THE distinguished Belgian zoologist, parasitologist and palæontologist, Pierre Joseph van Beneden, was born at Malines 150 years ago on December 19, 1809 After graduating M D at Louvain, he abandoned medical practice for natural history, but all his life maintained a keen interest in those branches of medicine which are aided by the study of the lower organisms In 1831 he was appointed conservator of the Natural History Museum in Louvain, and in 1835 professor of zoology at the University of Ghent In the following year he was elected to the corresponding chair at Louvain, which he occupied until his death In 1843 he established at his own expense one of the earliest laboratories of marine zoology and aquaria Author of some 200 brochures, his best-known works are "Zoologie Médicale" (1859) and "Ostéographie des Cétacées Vivants et Fossiles" (1868–80), both written in co-operation with Paul Gervais, and "Les Commensaux et les Parasites dans le Règne Animal" (1875, English translation, "Animal Parasites and Messmates", 4th ed, 1889) He made original contributions to scientific knowledge of the development of polypi and of worms, both intestinal and vesical, was the first to distinguish between 'commensalisme' and 'mutualisme', and enriched the catalogue of cetaceous fossils by several new species Recipient of many honours, he was a foreign member of the Royal Society and of the Linnæan, Geological and Zoological Societies of London, and in 1881 served as president of the Royal Belgian Academy In 1886 he was created Grand Officer of the Order of Leopold A modest and kindly man, he died at Louvain on January 8, 1894 His fame has been eclipsed by that of his son, Édouard van Beneden (1846–1910), the embryologist

Astronomy for the Layman

IN a series of articles in the *Illustrated London News* early in 1959, Dr R A Lyttleton described the astronomical universe starting at the Earth and working outwards These articles proved of great interest, and consequently the *Illustrated London News* is publishing a second series of astronomical articles, this time they are written by Prof H Bondi, of King's College, London The first appeared on October 31, and the remaining eleven articles are following at weekly intervals As before, the articles are accompanied by photographs and by illustrations drawn by Mr G H Davis, the special artist of the *Illustrated London News* Prof Bondi started with the most distant objects observed, and will work inwards in later articles After some preliminary remarks on the philosophical basis of science he discusses the expansion of the universe His second article discusses the famous paradox of Olbers (Why is it dark at night?), and this is followed in the third and fourth articles by an account of the evolutionary and steady-state theories of cosmology and of possible observational tests of these theories In subsequent articles Prof Bondi will discuss the stars, interstellar and interplanetary space and gravitational problems in the solar system, ending with the motion and magnetism of the Earth

Management in India

IN her five-year plan, India is trying democratically to meet the desperate needs of her peoples for better living conditions Industrialization is proceeding rapidly, and it is encouraging to read how leaders of industry in India are not only trying to avoid the mistakes made by Western countries during their industrial revolution but are also seeking to utilize the best practices of the best industrial organizations in Western countries. The Ahmedabad Textile Industry's Research Association has attracted interest for the attention it is paying to the industrial application of research, the use of work study, and the training of technologists and technicians. Its latest venture is the holding of a conference deriving its inspiration from H.R.H. the Duke of Edinburgh's Study Conference on the Human Problems of Industrial Communities within the Commonwealth and Empire. Many of the subjects selected for study were the same as those arranged at the Duke of Edinburgh's conference at Oxford. It was particularly appropriate that the Duke was able to open the conference, while another distinguished speaker was Sir Alexander Fleck. The proceedings of the Conference (Ahmedabad Textile Industry's Research Association. Proceedings of the Fifth Management Conference, January 28, 29 and 30, 1959. Pp. ix+93. Ahmedabad: Ahmedabad Textile Industry's Research Association, 1959) have now been published.

A Giant Plesiosaur

About sixty years ago a fossilized piece of the mandible of a large skull, with three broken teeth preserved on each side, was found in rocks of the Lower Cretaceous near Hughenden, Queensland. The specimen, which is in the collection of the Queensland Museum, is about 8 in. long and 5½ in. in height and breadth. The imperfect teeth were estimated to have been originally at least 10 in. long. The fragment was tentatively identified as a portion of a mandible of an ichthyosaurus. In 1923, the late Mr. Heber Longman, then director of the Queensland Museum, decided that it belonged to a new type of plesiosaur, and the animal was named *Kronosaurus queenslandicus*. In 1931, Mr. William Schevill, of the Museum of Comparative Zoology at Harvard College, U.S.A., while passing through Army Downs, North Queensland, noticed a number of fossil bones partly showing in the Lower Cretaceous rocks. Four and a half tons of rock was blasted out with dynamite and packed and despatched to the Museum at Harvard. After its arrival, Arnold Lewis, a Museum assistant, attempted to free the bones from the hard rock. About six months ago this work was successfully completed, and the skeleton was put together under the direction of the Museum director, Dr. Alfred S. Romer. The skeleton is 42 ft. in length. It has a triangular-shaped skull, 9 ft. long, with eighty spiked teeth each up to 8 in. in length. The characters of the teeth and mandible are identical with those of the mandible fragment recorded by Longman in 1923 (*Austral. Mus. Mag.*, 13, No. 2, June 15, 1959).

Syncarid Crustacea

Until recently only one syncarid was known from the Australian mainland (*Austral. Mus. Mag.*, 13, No. 2, June 15, 1959). This is *Koonunga*, which was described in 1907. Originally it had been found at Ringwood, now an outer suburb of Melbourne, and the stream in which it lived was long ago converted to a storm-water drain. In 1930 it was reported that *Koonunga* was extinct. During the past few years it has turned up in a variety of places, and is now known to occur sporadically across the southern part of Victoria. *Koonunga* is about one-third of an inch long, brownish in colour, and has a slender, almost cylindrical body. Its eyes are very small, and, unlike those of *Anaspides* and shrimps, are not stalked. It can swim actively, using its legs and abdominal appendages, but is more often found running rapidly over the bottom of pools and streams. This method of locomotion is so distinctive that *Koonunga* cannot be mistaken for any other aquatic animal. It relies on its agility and on its capacity for burrowing into mud to escape from enemies, for it is helpless against predatory aquatic insects.

Koonunga lives in small permanent or semi-permanent swamps and in pools in streams which flow vigorously only after heavy rains. Since many of these places are apt to become dry during the summer, and since the adults cannot withstand desiccation, it had been supposed that *Koonunga*, like so many other freshwater crustaceans, would lay drought-resistant eggs. It is now known, however, that the breeding season is during winter. The eggs, which are inserted singly or in small batches into decaying plants, develop over a period of about two months and hatch in the spring. It appeared that *Koonunga* could survive drought only by descending underground; they have been obtained from pits 2–3 ft. deep in the beds of dried-out streams. *Koonunga* can burrow swiftly into soft mud, but would not seem capable of forcing its way through heavy subsoil. The indications are that, in making its descent, it uses the burrows of freshwater crayfish. These crayfish are known to follow the water-table down to a depth of 6 ft. or more, and could thus provide a safe refuge for *Koonunga* during periods of drought. In some places *Koonunga* must remain underground continuously for six months or more. From this mode of life it would seem only a short step to a wholly subterranean existence, and work in Victoria over the past few years indicates the presence of a rich underground fauna of syncarids. Already, four new species have been found. They lack eyes, and have suffered a general reduction in pigmentation so that they have a translucent, white appearance. The largest species is nearly half an inch long, the smallest only one-sixth of an inch. Though these syncarids are typically subterranean in habit, they may, in special circumstances, live in surface water, and this is where they have been found. Pools are advantageous to syncarids in that few other aquatic animals live in them and there is little competition. The survival of *Anaspides* almost unchanged since Palæozoic times has been attributed to its living in a stable environment and to its freedom from predation. Conditions on the mainland are less stable. *Koonunga* and its allies would seem to owe their survival to their close association with the freshwater and land crayfishes.

The Liverpool Geological Society

The centenary of the Liverpool Geological Society will be celebrated during January 1–3 by a three-day meeting devoted to recent advances in geology. At this meeting, run jointly with the eighth Inter-University Geological Congress in the University of Liverpool, the following addresses will be delivered: Dr. W. S. Mackenzie, on "Experimental Petrology", Prof. S. I. Tomkeieff, on "The Progress of Geology in the U.S.S.R.", Dr. G. Voll, on "Petrofabrics and Small-scale Structures", Prof. C. F. Davidson, on

"Aspects of Radiogeology", Dr R W Girdler (in the absence of Dr R G Mason), on "Geophysical Researches on the Sea Floor", Dr J A Clegg, on "Palæomagnetism", Prof W C Krumbein, on "Numerical Data in Geology", Dr L M J U van Straaten, on "Deltaic Sedimentation", Dr R H Cummings, on "Micropalæontology", Dr J S Weiner (in the absence of Prof T S Westoll), on "Sequences in Hominoid Evolution" The address by Prof T S Westoll on "Vertebrate Palæontology", though not given at the meeting, will be published with the other addresses in January in the centenary issue of the *Liverpool and Manchester Geological Journal* Dr Clegg's and Dr Weiner's addresses will be published in abstract Details of the meeting can be obtained from R G C Bathurst, Department of Geology, University of Liverpool

The Night Sky in January

FULL moon occurs on Jan 13d 23h 51m U T and new moon on Jan 28d 06h 16m The following conjunctions with the Moon take place Jan 10d 09h, Aldebaran 0 7° S, Jan 25d 08h, Jupiter 5° S, Jan 25d 15h, Venus 4° S In addition to these conjunctions with the Moon, Venus is in conjunction with Antares on Jan 9d 04h, Venus being 7° N, Mercury with Saturn on Jan 11d 04h, Mercury being 1 8° S, Venus with Jupiter on Jan 21d 11h, Venus being 1 1° N, and Mars with Saturn on Jan 31d 11h, Mars being 1 2° S Mercury is too close to the Sun for observation Venus is a morning star, visible low in the south-east before sunrise It rises at 4h 40m and 5h 45m on January 1 and 31, respectively Its stellar magnitude is −3 6, its distance increases during the month from 98 to 116 million miles and the visible portion of the apparent disk increases from 0 714 to 0 809 Mars is badly placed for observation, rising about an hour before the Sun Jupiter is a morning star, rising at 6h 30m, 5h 50m and 5h 00m on January 1, 15 and 31, respectively It may be seen low in the south-east before sunrise, its stellar magnitude is −1 4 Saturn is too close to the Sun for observation Occultations of stars brighter than magnitude 6 are as follows, observations being made at Greenwich Jan 10d 17h 39 7m, 318 *B* Tau (*D*), Jan 11d 17h 41 9m, 130 Tau (*D*), Jan 12d 20h 12 7m, 26 Gem (*D*) *D* refers to disappearance The Quadrantid Meteors are active on January 3–4, with a predicted maximum at Jan 4d 05h The radiant is near R A 15h 28m, Dec +50°, and conditions are favourable for observation The Earth is at perihelion on January 4, its distance from the Sun being 91 4 million miles

University News

Birmingham

DR A P D THOMSON, senior lecturer in anatomy, has been appointed acting director of the Department of Anatomy as from January 1 The following appointments have been made Dr D S Urch, lecturer in chemistry, J C Maltbaek, lecturer in mechanical engineering, G C-Y Hu, lecturer in highway and traffic engineering, G H J Bennett, lecturer in industrial metallurgy Dr C G Wall, lecturer in chemical engineering, R H Jones, assistant lecturer in civil engineering, P J Waterton, staff Fellow in physics, Dr V Knapp, research Fellow in nuclear physics, Dr M Gage, research Fellow in geology, M H B Hayes, I C I Fellow in chemistry, Dr J P Simons, Fellow in chemistry, D W Thomas, National Coal Board research Fellow in physical chemistry

Glasgow

THE Minister for Science, the Right Hon the Viscount Hailsham, was elected Rector of the University on October 26

The new Engineering Building was inaugurated by the Right Hon the Viscount Montgomery of Alamein on November 4

The following have been appointed to lectureships R E Azuma and W R Hogg, experimental and theoretical physics, Helen S Dunsmore and G S Harris, chemistry, W Graham Jardine, geology, and J Leech, computing laboratory, and the following to research fellowships A Bhati, A C Day, W J McMaster and W Parker, chemistry, J D Roycroft, solid state physics, and Wm C Russell, virology (first Lock fellowship)

For the present session, 392 new students (302 men and 90 women) have been admitted to the Science Departments, compared with 372 in 1958 The total of matriculated students in the University as a whole now stands at 6,566, compared with 6,330

Southampton

THE following appointments have been announced Dr E M Wilson, senior lecturer and director of computation, Mr P C Parks, lecturer in aeronautical engineering, Mr G G Bloodworth, lecturer in electronics, Mr J F Barrett, De Havilland research Fellow in aeronautical engineering, Mr M T Thew, Vokes research Fellow in mechanical engineering

Announcements

THE fifth Levinstein Memorial Lecture of the Society of Chemical Industry will be delivered by Mr L H Williams on February 5 He will speak on "The Future of Chemicals from Petroleum" and the lecture, which is open to the public, will be given in the Large Chemistry Theatre, University of Manchester at 6 30 p m

THE British Welding Research Association and the Engineering Department, the University of Cambridge, are jointly organizing a symposium under the title of "Fatigue of Welded Structures" This is to be held in the Department of Engineering at the University of Cambridge during March 29–April 1 Further information can be obtained from the British Welding Research Association, Abington Hall, Abington, Cambs

A POSTGRADUATE course of nine lectures on "Newer Developments in the Chemistry of the Non-Metals" will be given at Kingston Technical College during January 27–March 23 The fee for the course is £1 2*s* 6*d* Further information can be obtained from the Principal, Kingston Technical College, Fassett Road, Kingston-upon-Thames

KODAK, LTD, are offering up to six annual scholarships to be known as "Kodak Scholarships in Colour Photography" Successful candidates will be given about three months specialized instruction in the laboratories and studios of the Eastman Co in Rochester, New York Approved expenses will be paid Further information can be obtained from the Secretary, Kodak, Ltd, Kingsway, London, W C 2

BRITISH AGRICULTURAL HISTORY SOCIETY

THE British Agricultural History Society held its annual winter conference, in co-operation with the Association of Agriculture, at the Institute of Education, University of London, on December 5, under the chairmanship of its newly elected president, Sir Keith Murray, who was welcomed with acclaim. Sir James Scott Watson retired this year after having been president of the Society since its inception in 1953.

Unfortunately, sudden illness prevented Mr. W. B. Mercer from attending to give his proposed lecture on the "Development of Agricultural Education and Advisory Services". This hiatus in the programme was ably filled by Mr. T. W. Fletcher, of the Department of Agricultural Economics, University of Manchester, with a paper on "Lancashire Livestock Farming in the Great Depression".

Mr. Fletcher, whose views on the farming history, especially of Lancashire, in the past three decades of the nineteenth century are somewhat revolutionary, showed that the livestock farmers of Lancashire did not, in fact, suffer in the depression. On the contrary, their standards of output, purchase of imported concentrates and other feeding stuffs, as well as their incomes, improved. The reasons for this were not far to seek. The local demand, both number of urban mouths and size of urban incomes, was growing. Consequently, the livestock farmers had a market, so to speak, on their doorstep for all the milk, butter, cheese, beef, mutton and pork that they could produce. On the east side of the county, too, there was a large demand from the West Riding industrial district. In such circumstances, it is not surprising to learn that rents were well paid and stable, and that relations between landowners and tenants were amicable.

The afternoon session was opened by Mr. O. R. McGregor, reader in social institutions, University of London, with a paper, "Free Trade in Land in the Victorian Period". Mr. McGregor argued, in a way that would certainly have pleased Maitland and Vinogradoff, that in any event for the nineteenth century the study of the social institutions surrounding farming was more important than the study of the development of technical changes. With wide reference to contemporary dialectic he emphasized the conflict between the rising class of urban industrialists and of the small number of great landowners (not more than about a thousand) who were striving by all means to retain their dominance of the political scene, and the prestige and patronage, for example, in Army and Church, that derived from it. He emphasized that the landowners, who used every possible device to prevent the break-up of estates—primogeniture, entail and settlements—regarded the land not so much as a rent- or food-producing commodity, but as a possession of social value. This outlook coloured their relation with their tenants, whom they wished to keep in mercy as tenants-at-will, and their attitude towards the increasingly wealthy and pugnacious middle classes who demanded 'free trade in land'. It was significant that so many members of the House of Commons before 1870 were landowners and land agents, not to speak of the House of Lords. This lecture certainly provided a new approach to the problems of farming history in the nineteenth century.

Finally, Miss Edith Whetham, Gilbey lecturer in the history and economics of agriculture, University of Cambridge, discussed "Cambridgeshire Tithe Maps, 1836–1890". She said that the county was backward in 1836 and that the tithe maps therefore gave a fine illustration of the change from open to enclosed fields in many parishes. She did not develop the subject at length, preferring to allow the documents exhibited, and the photostats passed around, to confirm it for her.

G. E. FUSSELL

NATIONAL RESEARCH COUNCIL OF CANADA

STRESS has been laid on a recent report on the support given to postgraduate research in the universities of Canada, for which some 34 million dollars have been provided by the National Research Council of Canada since 1917*. In the current year, 5.9 million dollars were provided for this purpose by way of 681 grants and 435 scholarships, fellowships and associateships, and expenditure is expected to reach 8.2 million dollars in 1959–60. The Council itself employs a scientific research staff of 613 (including 149 postdoctorate Fellows), 883 technicians and 887 general service and administrative staff. Much of the work of the Division of Applied Biology is in the applied field, and its statistical studies of short-term protein variability in cargoes of Northern wheat exported from Vancouver were expanded (in co-operation with the Grain Research Laboratory Board of Grain Commissioners) to permit accounting for this variability as the resultant of random differences between successive car loads from the same shipping point, of weekly variations in the geographical pattern of car-loads, and of mixing incidental to terminal limeing, handling and loading. A study of the effect of exposure on new-born caribou indicated that caribou calves are quite sensitive to cold and wind, to which they respond by a marked increase in metabolism. Investigations are also in progress on the fundamental properties of the hemicelluloses of common pulping woods, designed to assist pulp-makers in the production and use of semi-chemical pulp, but the report emphasizes that the biological sciences occupy an unfavourable position in the overall Canadian scientific effort.

At the Atlantic Regional Laboratory, Halifax, a chelating chemical as a dip before frying was found to prevent 'greying' in the production of partly precooked French fried potatoes, due to an abnormally high content of iron in the environment, while at the Prairie Regional Laboratory, Saskatoon, gas–liquid chromatography has been used for the quantitative determination of fatty acids in oils and fats, and a new type of foam breaker developed which operates on the principle of rapid acceleration of the foam through a nozzle, using only pressure from air charged into the fomenter The work of the Division of Applied Chemistry has gradually changed in recent years in an effort to obtain broader information in specific fields so that *ad hoc* problems have received less attention Much of its work is related to petroleum and corrosion chemistry In the Division of Pure Chemistry, which is organized in thirteen sections, outstanding achievements of the year were the determination of the total structure of aconitine, the establishment of characteristic zone patterns for each type of functional group, following the determination of the infra-red spectra of many steroids, and the development of the new technique, known as nuclear magnetic resonance, in which the nucleus within a molecule is used as a 'probe' to investigate details of molecular structure

---

* Forty-Second Annual Report of the National Research Council of Canada, 1958–59, including the Annual Report of Canadian Patents and Development Limited. Pp. 26. (Ottawa: Queen's Printer, 1959.)

The Division of Applied Physics has produced a new kind of plotting instrument for making maps from air photographs, and the Division is also investigating the suitability of using for the measurement of time an invariable frequency of vibration emitted by some atom or molecule, and observations over six months have shown promising agreement of the cæsium 'clock' with the one at the National Physical Laboratory, Teddington Much cosmic-ray work was carried out for the International Geophysical Year by the Division of Pure Physics, and micro-wave technique was used to determine precisely the distances between the atoms in molecules of acetone, propiolic aldehyde, vinyl cyanide, nitric acid, methyldifluorsilane and formamide, while a detailed theory has been developed which appears to be in excellent agreement with experimental data on the multiple scattering of charged particles The thermoelectric powers of copper and silver, among others, at temperatures much below 1° absolute have been found to be extraordinarily high, higher by orders of magnitude than present-day theory predicted

In October 1958 the new Fire Research Building was officially opened as the final part of the Building Research Centre, and in its work of keeping the National Building Code of Canada up to date the Division of Building Research has undertaken studies of the actual loads on structures due to floor loadings, wind and snow In the Division of Mechanical Engineering, emphasis on projects relating to improvements in transport in Canada continued, including harbour improvements, winter navigation by water, rail transport and various aspects of the evolution of new aircraft capable of vertical take-off and landing

About half the programme of the Radio and Electrical Engineering Division was concerned with defence Techniques were developed for producing and measuring extremely low pressures in gases, and the Division co-operated with the National Aeronautical Establishment in developing a small radio transmitting beacon which is flung clear from the tail of the aircraft in the event of disaster In co-operation with the Marine Services Branch of the Department of Transport, electric circuits are being applied to marine navigational devices, often for isolated locations

DYNAMIC AND STATIC DEFORMATION OF ARMCO IRON

By H. P. TARDIF and P. CHOLLET

Canadian Armament Research and Development Establishment, Quebec

A RECENT article on the above subject[1] showed that the mechanical properties of Armco iron were slightly lower after a previous amount of dynamic prestrain than after the same amount of static deformation This finding confirmed the results of Campbell and Duby[2] but was contrary to those of Harris and White[3] The object of the present article is to give further results concerning the effects of variables such as amount of prestrain and temperature of deformation

The same method of dropping a weight on a specimen 0 75 in diameter and 1 5 in long placed on a large solid anvil was used By varying the height of drop, the velocity of impact and thus the amount of deformation were changed Other specimens were then deformed statically by the same amounts obtained during dynamic impact After deformation, the specimens were cut in two longitudinally, with one half hardness tested before ageing and the other after ageing The results are shown in Fig 1 The hardness was found to increase with amount of deformation for both static and dynamic deformation and the rate of increase in hardness was about the same for the two methods of prestraining The increase in hardness, however, is less for the dynamically than for the statically deformed specimens, for the whole range of deformation used, and this difference is approximately constant for that range of deformations

After ageing the difference in hardness is again approximately constant for both statically and dynamically deformed specimens If, on the other hand, one considers the difference in hardness between the aged and unaged condition for both static and dynamic prestrain, it will be seen that this difference increases with higher amounts of deformation This observation confirms established beliefs that the tensile strength of iron after strain-ageing increases with the amount of static prestrain It is seen here that the same phenomenon is observed with dynamic prestrain if we assume that tensile strength is proportional to hardness Hundy[4] has suggested that this effect could be ascribed to the formation of discrete submicroscopic carbide or nitride precipitates at dislocation junctures

The fact that hardness and other mechanical properties are lower after dynamic than after static prestrain was corroborated by compression and

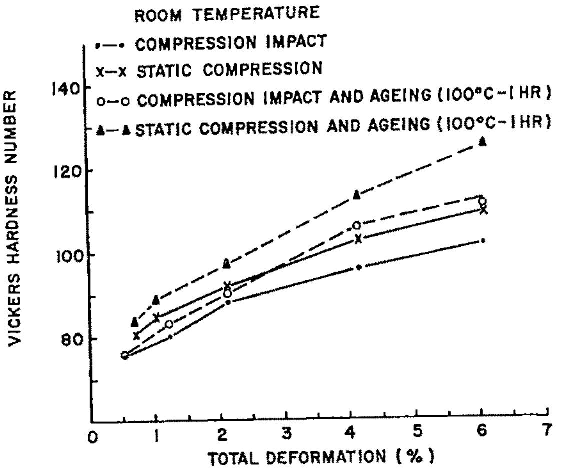

Fig. 1. Effect of total static or dynamic deformation on hardness before and after ageing

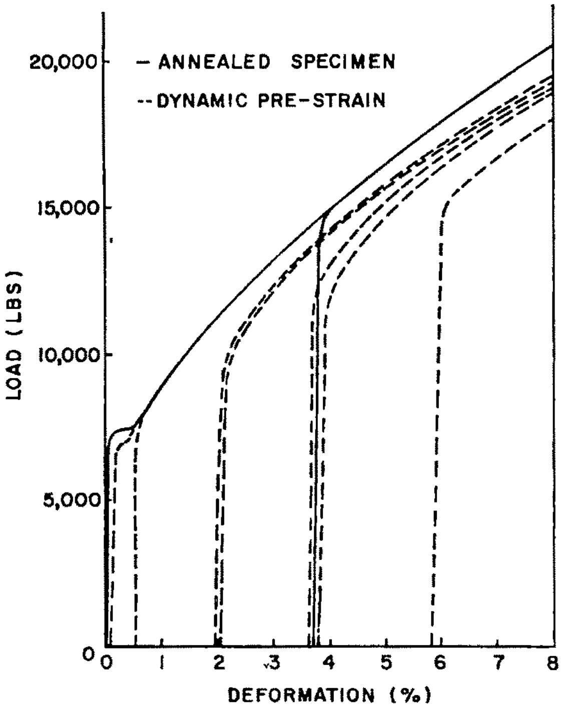

Fig. 2. Static load-deformation curves in compression showing softening of previously impacted specimens

tensile test results as shown in Figs. 2 and 3. The compression curves for specimens in the unaged condition all lie below the compression curves obtained for specimens deformed after comparable amounts of static prestrain. The same result was observed for statically and dynamically deformed specimens in the aged condition.

When the temperature is varied for a given height of drop, the same trends are observed, as seen in Fig. 4, except for the lowest temperature of testing (– 196° C.) where the results are about the same as those for the temperature of (– 75° C.). But again the hardness obtained after dynamic deformation is lower than that after static deformation, at all temperatures tested, both in the unaged and aged condition.

It can be assumed, as has been proposed by Campbell and Duby[2], that dynamic impact will activate a larger number of dislocations than static deformation because of the much higher stresses applied during the short-time dynamic loading. The larger number and more uniform distribution of free dislocations when compared with the same amount of static prestrain will permit the metal to deform more easily upon subsequent reloading. Consequently, the static mechanical properties of a dynamically prestrained specimen should be lower than that of a statically prestrained specimen as is seen to be the case from hardness, compression and tensile tests.

In two other series of tests, the deformation was restrained to a constant value while the temperature and the height of drop were varied. This restriction of the amount of deformation was accomplished by inserting an impactor arrester around the specimen, so that the impactor would be stopped at a given height and deform specimens by constant amounts independently of height of drop and temperature. The results seen in Fig. 5 show that the hardness of the dynamically deformed specimens, especially for the unaged condition, does not vary appreciably with height of drop, that is, velocity of impact, or with temperature for a constant deformation. This would thus imply that in the case of dynamic deformation the work-hardening is independent of velocity and temperature of deformation in the ranges used and that the hardness is a function mainly of the amount of deformation.

A similar conclusion had been reached previously by Campbell and Maiden[6], who prestrained two specimens by the same total amount of deformation, one by impacting twice at – 84° C. at 503 in./sec., the other by impacting once at room temperature at 460 in./sec. No significant difference was observed in the stress-strain curve, indicating that the shape

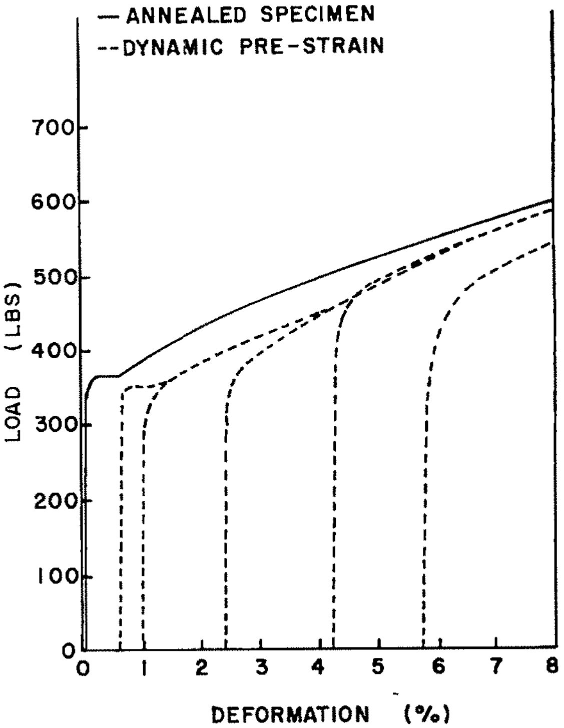

Fig. 3. Static tensile test results on annealed and dynamically prestrained specimens

of the curve was dependent mainly on the amount of deformation and not on the temperature, velocity or even number of impacts during deformation.

On a dislocation basis, it would also appear that the number of dislocations produced is independent of velocity of deformation and of temperature of tests but would depend mainly on the amount of deformation during the impact as was discussed previously[5]. The increase in hardness after ageing these specimens was also independent of height of drop and temperature.

It was thought of interest to determine the effect of temperature of static prestraining on the mechanical properties during subsequent static deformation at room temperature. Fig. 6 shows that low-temperature static prestraining has an effect similar to that of a dynamic prestrain in lowering the stress-strain curve below that obtained after static prestrain at room temperature.

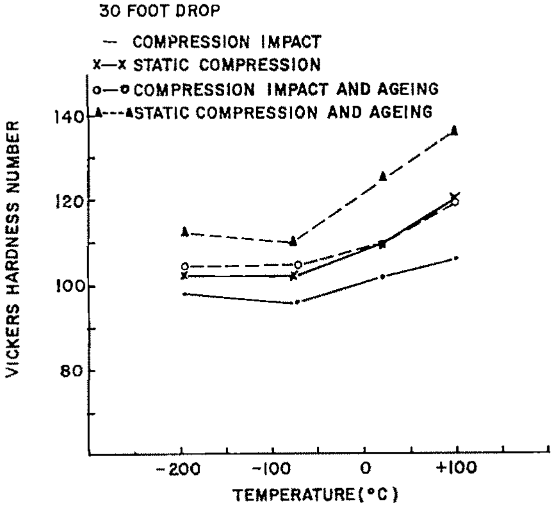

Fig. 4. Effect of temperature of deformation on hardness of statically and dynamically deformed specimens

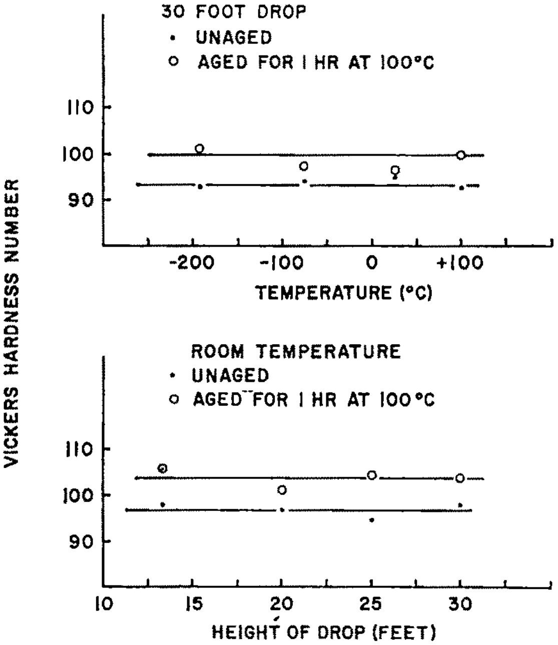

Fig. 5. Effect of temperature and velocity of deformation in 'restrained deformation' tests on resultant hardness

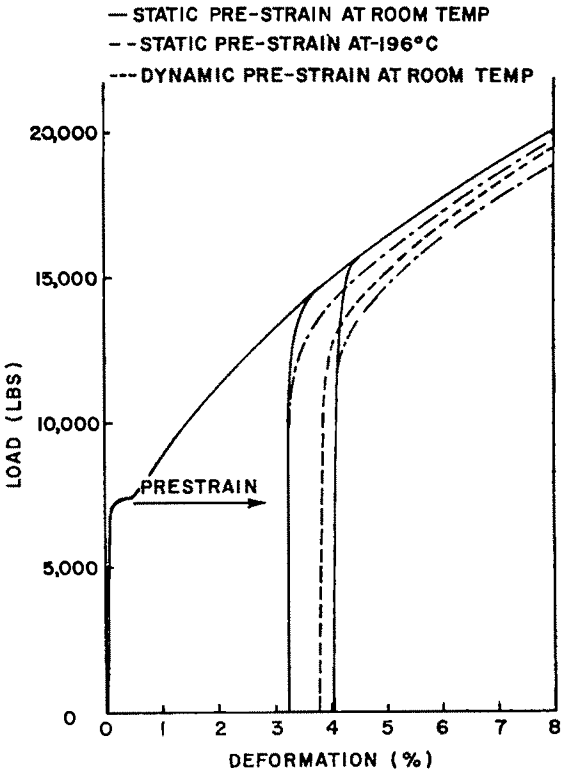

Fig. 6. Static load-deformation curves in compression for unaged, statically and dynamically prestrained specimens, illustrating the equivalence of strain-rate and temperature

This would mean that Campbell and Maiden's observation[5] that there was little difference in the stress-strain curves for the two specimens impacted at different temperatures and our observation of Fig. 5 where hardness is independent of temperature of deformation would only apply for dynamic prestrain. In the case of static prestrain, prestraining at low temperature will have an effect on the subsequent static curve, equivalent to that of a dynamic pre-deformation. By extending Campbell and Duby's theory one could say that the activation of a larger number of dislocation sources taking place under impact also takes place during low-temperature static deformation. At low temperature, the stress that must be applied to produce deformation is much higher than at room temperature (the 0·2 per cent proof stress being 3½ times higher than at room temperature for the Armco iron tested), permitting a larger number of dislocation sources to be released if we assume that dislocation sources can be released over a range of activation energies. On this basis, one would expect diffuse slip during static deformation at low temperature, and this was observed to be so in the course of metallographic examination of specimens. In a very recent paper Maiden and Campbell[6] have in fact observed the presence of diffuse slip during static deformation at low temperatures, and the equivalence of high strain-rates and low temperatures on mechanical properties of low carbon steels.

This article corroborates the foregoing observations on iron and extend them to the case of prestraining under these conditions.

It thus seems that the equivalence of effects of high strain-rates and low temperatures does not apply only during deformation as is already known, but also that their effects during prestraining will influence the behaviour of iron in the same direction during subsequent straining

AGGREGATION OF AN ACRIDINE DYE ON NATIVE AND DENATURED DEOXYRIBONUCLEATES

By Dr D. F. BRADLEY

National Institute of Mental Health, Bethesda, Maryland

AND

Dr G. FELSENFELD

Department of Biophysics, University of Pittsburgh, Pennsylvania

ACRIDINE orange has been shown[1] to form aggregates or 'stacks' when bound to polyanions The strength of the dye–dye interaction depends upon the polyion used, and is, in general, greater with flexible than with rigid polymers Since deoxyribonucleic acid undergoes a transition from a rigid, two-stranded helix to a flexible, random coil upon heating[2], it might be expected that an increase in dye–dye interaction would accompany this transition We wish to report the observation of such an increase in dye-stacking tendency accompanying the heat denaturation of deoxyribonucleic acid

Calf thymus deoxyribonucleic acid ('Sigma') was denatured by slowly heating a solution (2 mgm /ml, $M/1{,}000$ cacodylate buffer $pH = 6\ 7$) and removing aliquots after 10 min at specified temperatures The helix → coil transition was followed by the drop in viscosity and the increase in ultra-violet absorption at 260 mμ (Table 1 and Fig 1), and because of the low ionic strength used, occurred at relatively low temperatures ($T_m = 62°$)

Spectrophotometric titrations of acridine orange with native and denatured deoxyribonucleic acids were carried out as previously described[1] Sharp end-points were obtained at 1 deoxyribonucleic acid phosphate per acridine orange ion (Fig 2) The volume of deoxyribonucleic acid required to titrate a given amount of dye did not change with denaturation (Table 1), showing that no additional binding sites were produced by heating The end-point of the titration therefore provides a method for determining the concentration of deoxyribonucleic acid which is convenient, independent of the extent of denaturation, and which requires only a small amount of deoxyribonucleic acid (about 2–20γ)

Sedimentation studies showed essentially complete binding of the dye at the 1 1 point under the conditions used ($1\ 6 \times 10^{-5}$ M acridine orange, 1×10^{-3} M cacodylate buffer, $pH = 6\ 7$) At the 1 : 1 point, therefore, each deoxyribonucleic acid binding site is occupied, and every dye molecule has a dye molecule on each adjacent site with which to interact The spectrum of the dye in this 1 1 complex shows two bands, an α band or shoulder at 492 mμ which predominates in the free-acridine orange monomer spectrum and a β band at 464 mμ which predominates in the free acridine orange dimer spectrum[1,3] The relative heights of these two bands (β/α ratio) may therefore be considered to be a measure of the dimeric character of a dye molecule which is involved in the maximum number of dye–dye interactions possible on the particular polyanion As can be seen in Table 1 and Fig 1, this measure (β/α ratio) of dimeric character, or of stacking tendency, increases with denaturation, and further, the fractional increase in β/α follows closely the fractional changes in both viscosity and ultra-violet absorption

When measured under the above conditions, the β/α ratios of 1 1 complexes of acridine orange with a number of different native deoxyribonucleic acid samples are all about 1 28 (Stone, A L, and Bradley, D. F, unpublished results), so that a low β/α ratio of this magnitude may be used as one criterion for the 'nativeness' of deoxyribonucleic acid However,

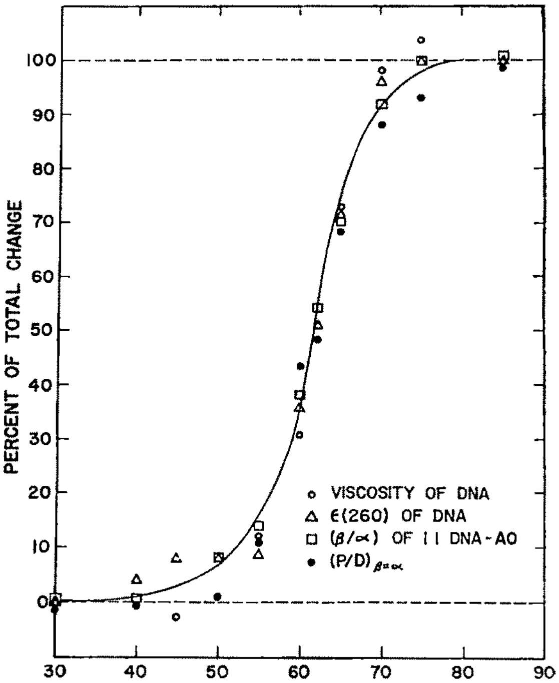

Fig 1 Thermal denaturation of deoxyribonucleic acid as measured by changes in properties of deoxyribonucleic acid and deoxyribonucleic acid-bound acridine orange Abscissa temperatures to which deoxyribonucleic acid solutions were heated Ordinate fractional changes in viscosity and ultra-violet absorption of deoxyribonucleic acid, and of visible absorption of acridine orange bound to the heated deoxyribonucleic acid For precise definition of quantities see legend to Table 1

CT, calf thymus deoxyribonucleic acid (Sigma Chemical Co), SS-DNA, salmon sperm deoxyribonucleic acid (California Foundation), S-RNA, soluble rat liver ribonucleic acid (S Luborsky), AT-RNA, ascites tumour ribonucleic acid (J Colter) $[\eta]$ is ηsp /c in cm ^{3}gm $^{-1}$ of 0 004 per cent deoxyribonucleic acid solutions in 0 25 M sodium chloride measured at an average shear $(\overline{\beta})$ of 209 sec $^{-1}$ E_{260} is the molar extinction of deoxyribonucleic acid at 260 mμ calculated using the deoxyribonucleic acid phosphate molarity obtained from the spectrophotometric titration with acridine orange ml DNA/mole AO is the volume of deoxyribonucleic acid required per mole acridine orange to reach the 1 1 point in the spectrophotometric titration with acridine orange (about 4 6 × 10^{-8} mole) $(\beta/\alpha)_{1\ 1}$ is the ratio of extinction at 464 mμ to 492 mμ of the dye in the 1 1 complex $dE/d(P/D)$ is the initial rate of change in E_{504} mμ with phosphate/dye ratio for $P/D > 1$ $(P/D)_{\beta=\alpha}$ is the ratio of deoxyribonucleic acid phosphates to acridine orange ions at which the extinctions at 464 and 492 are equal K's are the stacking coefficients (see text) with their mean deviations %'s are percentage changes in properties between 30 and 85°

since the 1 1 complex is quite easily dissociated into free acridine orange and deoxyribonucleic acid by dilution or by added salts, resulting in an increased α (monomer) band and spuriously low β/α ratio, the conditions under which β/α is determined must be carefully controlled For example, the complex may be 50 per cent dissociated (β/α = 1 0) either by lowering the acridine orange concentration to 0 8 × 10^{-5} M or by raising the buffer concentration to 4 × 10^{-3} M This extreme sensitivity to salt concentration accounts for the failure of Steiner and Beers[4] to observe a 1 1 complex with native deoxyribonucleic acid in 0 06 M salt and 0 7 × 10^{-6} M acridine orange However, these authors do observe a 1 1 complex with boiled deoxyribonucleic acid under these same conditions, indicating that the dye–polymer interaction is increased by disruption of the ordered deoxyribonucleic acid structure Kurnick[5] and Lawley[6] have also noted that heat denaturation and depolymerization affect the affinity of deoxyribonucleic acid for methyl green, rosaniline, and 5-aminoacridine

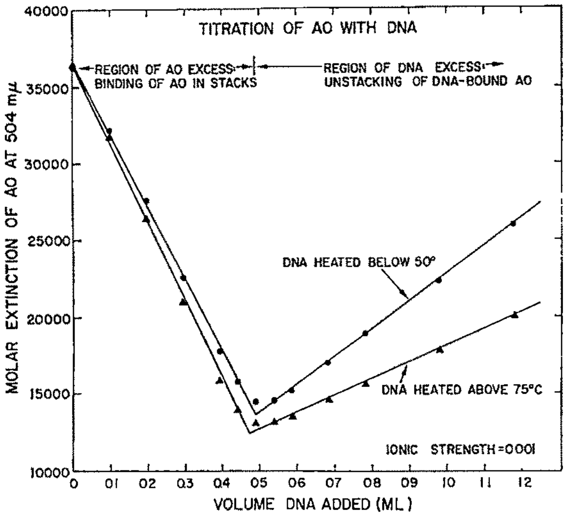

Fig 2 Spectrophotometric titration of acridine orange with deoxyribonucleic acid Molar extinctions of dye at 504 mμ calculated from volume-corrected optical densities M/1,000 cacodylate buffer, pH 6 7 Deoxyribonucleic acid solutions about 0 04 mgm / ml Upper curve, deoxyribonucleic acid solution (2 mgm /ml) slowly heated to 50° C , aliquot removed after 10 min , cooled and diluted , moles acridine orange = 4 65 × 10^{-8}, molarity acridine orange at end-point = 1 61 × 10^{-5} , lower curve, same as above but heated to 75° C , moles acridine orange = 4 60 × 10^{-8}, molarity acridine orange at end-point = 1 60 × 10^{-5} Titrations carried out at 27–28° C

$T2$ phage deoxyribonucleic acid prepared by the phenol extraction method is unique in showing β/α = 1 0 under all conditions, suggesting that either this deoxyribonucleic acid is more native than the others, or that stacking and/or binding is interfered with by the glucose groups or by residual bound spermine, etc Despite such variations in its absolute numerical value, the fractional increase in β/α with denaturation follows closely the viscosity and ultra-violet absorption curves under a variety of experimental conditions

On the deoxyribonucleic acid-excess side of the 1 1 point the bound acridine orange molecules begin to unstack as they distribute among the total available binding sites The extinction at the wave-length maximum (504 mμ) of bound, unstacked acridine orange therefore rises[1] As can be seen in Fig 2, the rate of unstacking is faster in deoxyribonucleic acids which have not been heated above the transition temperature The fractional decrease in unstacking rate (expressed as $dE/d(P/D)$, where P/D is the number of deoxyribonucleic acid phosphates per acridine orange ion) accompanying denaturation appears to lead the changes in other properties by about 5° C (Table 1), suggesting that deoxyribonucleic acid may undergo another structural transition which precedes that measured by viscosity, ultra-violet absorption, and β/α ratio changes

As unstacking proceeds with increasing P/D ratio the α (monomer) band increases and β (dimer) band falls The P/D at which the β/α ratio has fallen to unity may be used as a third measure of stacking tendency, and as shown (Table 1, Fig 1) this measure also follows quantitatively the viscosity–ultra-violet absorption transition

When the titration is carried to sufficiently high P/D (about 100 for deoxyribonucleates) the extinction at 504 mμ reaches a plateau corresponding to complete unstacking It has been shown[1] that the fraction of unstacked acridine orange, F, is related to P/D by a single-parameter equation

$$P/D = (1 - F^{1/2})^{-1} + (K - 1)(1 - F^{1/2})^{-1}(1 + F - F^{1/2})F^{1/2}$$

in which *K*, the stacking coefficient, is an absolute measure of stacking tendency defined in terms of a mathematical model of the stacking process. The value of *K* calculated from the plot of E_{504} vs P/D turns out to be 1·16 ± 0·14 for calf thymus deoxyribonucleic acid and very close to this value for a number of other preparations (Stone, A. L., and Bradley, D. F., unpublished results). A value of $K = 1$ corresponds to no stacking tendency, that is, to a completely random distribution of dyes among sites, and therefore native deoxyribonucleic acid, with a *K* value close to unity, nearly corresponds to this situation. This finding is in agreement with Lawley's[7] conclusion that rosaniline dimerizes on native deoxyribonucleic acid in "tolerable agreement" with a random distribution model.

It has been reported[1] that deoxyribonucleic acid and ribonucleic acid have similar stacking coefficients (with $K = 2·9$ and 3·3 respectively). It is apparent from the present findings that this conclusion was based upon experiments with partially denatured salmon sperm deoxyribonucleic acid (Table 1). Indeed, a comparison of the various measures of stacking suggests that unheated ribonucleic acid is more like denatured deoxyribonucleic acid than native deoxyribonucleic acid in those structural features responsible for dye stacking, for example, in having regions of both coiled and helix structure[8].

The data for the unstacking of boiled deoxyribonucleic acid, however, do not show good fit to the stacking equation ($K = 5·36 \pm 2·44$). A normal stacking curve (*K* about 3) is followed up to approximately 40 per cent unstacking. Beyond this, unstacking proceeds at a much slower rate, which is linear in log P/D, resulting in a higher average stacking coefficient than ribonucleic acid. This apparent increase in stacking tendency or flexibility at $P/D > 4$ may possibly be related to changes in the net charge on the deoxyribonucleic acid as the fraction of sites occupied by the acridine orange cations decreases, or to the presence in the boiled sample of a mixture of deoxyribonucleates with different binding affinities and stacking tendencies.

These results show that the tendency of acridine orange to aggregate is quite low when bound to native deoxyribonucleic acid, but that it increases markedly as the deoxyribonucleic acid is denatured. Several quantitative measures of stacking tendency have been described which may be used to estimate the extent of denaturation in partially denatured deoxyribonucleates. These findings provide additional evidence that the stacking tendencies of polyanions are intimately related to their structure in a qualitatively predictable manner. Furthermore, they may provide an important clue to understanding the complex colour patterns observed when acridine orange is used to stain tissues and, in particular, the general shift to dimeric character (enhancement of red phosphorescence) when living, stained cells are destroyed[3].

We wish to express our appreciation to Dr. A. L. Stone for helpful discussions, to Mrs. J. Johnson and Mrs. S. Huang for technical assistance, to Dr. S. Luborsky for a sample of soluble ribonucleic acid, and to Dr. J. S. Colter for a sample of mouse ascites tumour ribonucleic acid. One of us (G. F.) has been supported in part by a grant (*C*-3883) from the National Cancer Institute, U.S. Public Health Service.

EFFECT OF CHLORPROMAZINE UPON ISOLATED *d*-AMINO-ACID OXIDASE SYSTEMS

By Dr. ANDREW LASSLO and ANNE L. MEYER

Department of Pharmacology, Division of Basic Health Sciences, Emory University, Atlanta 22, Georgia

YAGI, Nagatsu and Ozawa[1] reported recently that chlorpromazine (N-[3′-dimethylaminopropyl]-3-chlorophenothiazine) is an inhibitor of *d*-amino-acid oxidase. They stated that substantial inhibition was achieved with 2×10^{-5} *M* chlorpromazine in a system consisting of a hog kidney *d*-amino-acid oxidase preparation, $1·6 \times 10^{-7}$ *M* flavin adenine dinucleotide, and $6·25 \times 10^{-2}$ *M* *d*-alanine, buffered at *p*H 8·3 with pyrophosphate (no temperature was given, nor the gas phase indicated). They also noted that marked inhibition was observed with the same concentration of chlorpromazine in the oxygen uptake of a freshly excised dog diencephalon homogenate, in which the endogenous respiration was inhibited by potassium cyanide; this phenomenon was attributed to the inhibition by chlorpromazine of *d*-amino-acid oxidase in the tissue, and it was suggested that there might be some relationship between the inhibition of flavin enzymes by chlorpromazine and the pharmacodynamic properties of the tranquillizing agent. In connexion with a study of the effect of gradual changes in the molecular constitution of synthetic entities upon isolated enzyme systems known to be associated with brain metabolism, we became interested in pursuing this work further.

Procedure 1. The work was carried out on a *GME*-Lardy *WB*-3 type Warburg instrument, using 15-ml. flasks. We have chosen Worthington's hog kidney *d*-amino-acid oxidase preparation and Calbiochem's flavin adenine dinucleotide (assay, 91 per cent, California Corporation for Biochemical Research, Los Angeles, California) for our initial experiments; 1×10^{-1} *M* *dl*-alanine was adopted as substrate after a study of the enzyme activity under varying enzyme and substrate concentrations (Worthington's *d*-amino-acid oxidase preparation is prepared by extracting the conventionally prepared hog kidney acetone powder with distilled water for 1 hr in the cold, centrifuging the mixture, and lyophilizing the extract immediately Worthington Biochemical Corporation, Freehold, New Jersey) The buffers used were 0 05 *M* KH_2PO_4–NaOH (*p*H 6 88), 0 025 *M* $Na_4P_2O_7$–HCl (*p*H 7 93), and 0 02 *M* $Na_4P_2O_7$–HCl (*p*H 8 27) The gas phase was air, and the temperature was 37° C The reaction volume totalled 3 2 ml, with 0 12 ml 20 per cent potassium hydroxide in the centre well (2 cm × 2 cm Whatman No 1 filter paper), and 0 4 ml substrate solution in the side-arm, all other reaction components were contained in the main compartment The inhibitors were introduced in 0 05 ml of aqueous solution, appropriately concentrated to yield the desired dilution of the compounds in the final reaction mixture Equilibration was initiated at − 45 min, with readings every 5 min beginning at − 25 min Dumping was effected at 0 min, with the side-arm being washed twice with the reaction mixture Each manometer was read at 10-min intervals during the reaction period of 0 to + 60 min The *p*H of the contents of the flasks was checked at the end of the experiment Each set of conditions was run (at least) in triplicate

Procedure 2 Some of the experiments required a change in the original arrangement (procedure 1) of the reaction components and the following modification was introduced the enzyme and inhibitor solutions (combined volume 0 65 ml) were placed in the side-arm, and the main compartment contained the coenzyme and substrate in the buffer balance (combined volume 2 43 ml) Otherwise the same procedure was followed

We expressed the rate as

$$V = \left[\frac{(\mu\text{l oxygen at 40 min}) - (\mu\text{l oxygen at 10 min})}{30}\right] \times 60$$

where *V* signifies µl oxygen/hr absorbed within the reaction interval of + 10 to + 40 min, during which the rate was always linear

Procedure 3 In experiments where the reaction was not preceded by an incubation period, the reactants were situated in accordance with the original arrangement (procedure 1), however, dumping was effected just prior to their exposure to the water-bath In this instance, the rate (*V*) was calculated from the reaction interval of + 30 to + 50 min, during which the rate was always linear

The percentage of inhibition (*I*) and potentiation (*P*) were calculated as follows

$$I = \left(\frac{V_c - V_i}{V_c}\right) \times 100 \qquad P = \left(\frac{V_p - V_c}{V_c}\right) \times 100$$

where V_c represents the control rate, V_i the inhibited rate, and V_p the potentiated rate

The chlorpromazine hydrochloride used in our experiments was furnished by Dr Paul Mattis of the Smith, Kline and French Laboratories in Philadelphia, Pa, the reserpine phosphate by Dr Albert J Plummer, of Ciba Pharmaceuticals in Summit, N J, *Ro*-1-9569/7 by Dr W E Scott, of Hoffmann-LaRoche, Inc, in Nutley, N J, and the *d*-lysergic acid diethylamide by Mr John M Cole, of Sandoz Pharmaceuticals in Hanover, N J

The enzyme systems used in the experiments were characterized kinetically (procedure 1) A linear reciprocal Lineweaver–Burk plot[2] of the enzyme activity, buffered with phosphate at *p*H 6 88, at varying enzyme and substrate concentrations, was graphically evaluated as suggested by Dixon[3] and Reiner[4], the Briggs–Haldane constants[4a,5] (0 059, 0 044, 0 041 and 0 051) did not vary significantly with enzyme concentration and were well within the range of variability for independent determinations in the systems investigated (Reiner, J M, personal communication, 1959) In pyrophosphate-buffered systems (*p*H 8 27), however, the enzyme activity did not yield a linear reciprocal plot, further discussion of this point is reserved for a future occasion

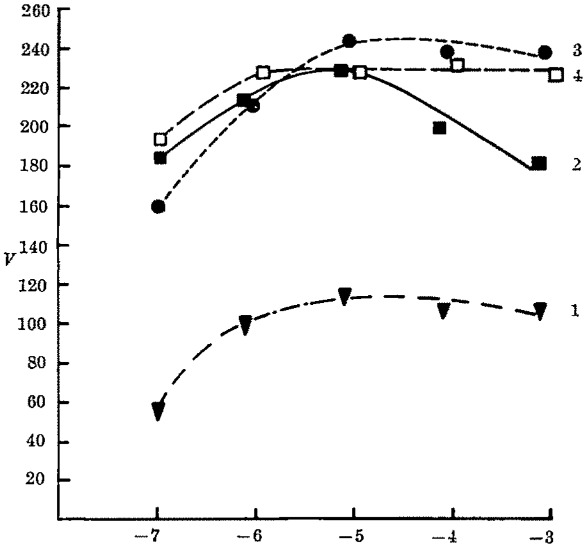

Fig 1 Comparative enzyme activity in phosphate- and pyrophosphate-buffered systems (in curves 1, 2 and 3, coenzyme incubated with enzyme according to procedure 1, in curve 4, coenzyme incubated with substrate according to procedure 2) Common 1 × 10^{-1} *M* *dl*-alanine, base level flavin adenine dinucleotide (estimated at 1 × 10^{-7} *M*/1 × *d*-amino-acid oxidase) Curve 1, 1 × *d*-amino-acid oxidase plus 7 83 × 10^{-7} to 7 83 × 10^{-4} *M* flavin adenine dinucleotide, 0 05 *M* phosphate, *p*H 6 88 Curve 2, 1 × *d*-amino-acid oxidase plus 6 73 × 10^{-7} to 6 73 × 10^{-4} *M* flavin adenine dinucleotide, 0 02 *M* pyrophosphate, *p*H 8 27 Curve 3, 2 33 × *d*-amino-acid oxidase plus 9 19 × 10^{-7} to 9 19 × 10^{-4} *M* flavin adenine dinucleotide, 0 05 *M* phosphate, *p*H 6 88 Curve 4, 1 × *d*-amino-acid oxidase plus 1 05 × 10^{-6} to 1 05 × 10^{-3} *M* flavin adenine dinucleotide, 0 02 *M* pyrophosphate, *p*H 8 27

Another kinetic study revealed additional differences between enzyme activities in phosphate (*p*H 6 88) and pyrophosphate (*p*H 8 27) buffered systems (Fig 1) Curves 1, 2 and 3 are results obtained with procedure 1 in which the enzyme and the coenzyme were pre-incubated in the same compartment Curves 1 and 2 represent the activity of a given quantity of *d*-amino-acid oxidase and tenth-molar *dl*-alanine within a range of concentrations of flavin adenine dinucleotide, in phosphate- and pyrophosphate-buffered systems Curve 3 represents the corresponding activity of 2 33 times the amount of *d*-amino-acid oxidase used in the first two series of experiments, which raised the oxygen uptake in the phosphate buffer to approximately the same level as that of the original enzyme concentration in the pyrophosphate buffer While the oxygen uptake differed quantitatively in the two phosphate-buffered experiments (Fig 1, curves 1 and 3), corresponding to the enzyme concentration, the curves of the flavin adenine dinucleotide catalysis retained the same form In the pyrophosphate-buffered experiment, however, the graph of the activity took on a considerably different pattern (Fig 1, curve 2)

Table 1 EFFECT OF PRE-INCUBATION UPON THE ACTIVITY OF THE HOG KIDNEY *d*-AMINO-ACID OXIDASE PREPARATION

(1 × *d*-amino-acid-oxidase with base-level flavin adenine dinucleotide (estimated, 1 × 10^{-7} *M*) and 1 × 10^{-1} *M* *dl*-alanine)

Buffer (*M*) and *p*H	Pre-incubation period at 37° C prior to reaction (min)	
	45	0
Pyrophosphate (0 025) 8 04	$V = 183$	$V = 180$
Phosphate (0 05) 6 84	$V = 76$	$V = 78$

When the coenzyme and the enzyme were pre-incubated in separate compartments (procedure 2), the pyrophosphate-buffered run yielded curve 4 of Fig 1 , the phosphate-buffered runs carried out under these conditions did not differ significantly from those represented by curves 1 and 3

Since Burton has found[6] that some *d*-amino-acid oxidase preparations are subject to thermal inactivation at 37 5° C in pyrophosphate-buffered (*p*H 8 27) systems, we have compared the activity of our enzyme systems in simultaneous runs with (procedure 1) and without (procedure 3) a 45 min pre-incubation period , the results are summarized in Table 1 While our enzyme systems were not affected by pre-incubation at 37° C , one should bear in mind that Burton apparently dealt with a purer and more sensitive sheep kidney preparation

We observed a 40 per cent inhibition with 1 × 10^{-3} *M* chlorpromazine in phosphate buffer (*p*H 6 88, procedure 1), but were unable to effect appreciable chlorpromazine inhibition in pyrophosphate buffers (*p*H 7 93 and 8 27) under similar conditions The inhibition in phosphate-buffered systems was substantially influenced by the flavin adenine dinucleotide concentration of the reaction mixture and by the exposure of the enzyme to the inhibitor during pre-incubation Our findings are summarized in Table 2

The effect of chlorpromazine upon phosphate-buffered systems with increasing flavin adenine dinucleotide concentrations is illustrated in Fig 2 (curve 2) The phenomenon of chlorpromazine potentiation at high concentrations of flavin adenine dinucleotide seems to be correlated with some inhibition by flavin adenine dinucleotide itself at such coenzyme-levels (Fig 2, curve 1), which tendency becomes even more conspicuous in curve 2 of Fig 1 This prompts the suggestion that complex formation between chlorpromazine and flavin adenine dinucleotide may occur Reiner[4b] actually worked out a mathematical treatment for cases in which an inhibitor effects potentiation by interacting with a second inhibitory substance present in the reaction mixture. Complex formation between flavin adenine dinucleotide and chlorpromazine is chemically also conceivable by means of charge effects between the pyrophosphate moiety of the flavin adenine dinucleotide and a basic function (or functions) of the chlorpromazine molecule within some *p*H ranges

In order to compare the effect of flavin adenine dinucleotide upon the inhibition of *d*-amino-acid oxidase by chlorpromazine prior and subsequent to pre-incubation, we ran a series of experiments summarized in Table 3 It is interesting that, when

† 7 29 × 10^{-6} *M* flavin adenine dinucleotide in V_e

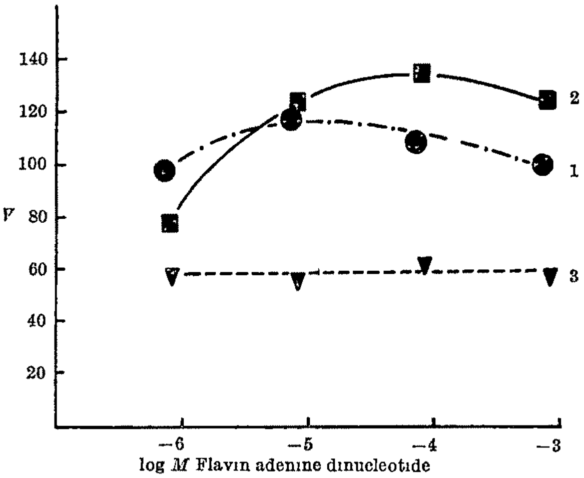

Fig 2 Comparative effects of chlorpromazine and nicotinic acid in phosphate-buffered systems (procedure 1) Common 1×10^{-1} *M* *dl*-alanine, base-level flavin adenine dinucleotide (estimated at 1×10^{-7} *M*), 1 × *d*-amino-acid oxidase, 0 05 *M* phosphate, *p*H 6 88 Curve 1, plus $7\ 27 \times 10^{-7}$ to $7\ 27 \times 10^{-4}$ *M* flavin adenine dinucleotide Curve 2, plus $7\ 58 \times 10^{-7}$ to $7\ 58 \times 10^{-4}$ *M* flavin adenine dinucleotide and 1×10^{-3} *M* chlorpromazine Curve 3, plus $8\ 04 \times 10^{-7}$ to $8\ 04 \times 10^{-4}$ *M* flavin adenine dinucleotide and 1×10^{-3} *M* nicotinic acid

excess flavin adenine dinucleotide was combined with the enzyme-inhibitor mixture subsequent to pre-incubation (procedure 2), the coenzyme would not reverse or even decrease the inhibition, yet the flavin adenine dinucleotide content of the final reaction mixture was about a hundred times that which effectively counteracted inhibition when the coenzyme was pre-incubated with the enzyme-inhibitor mixture (procedure 1) (The small volume for the pre-incubation of the enzyme-inhibitor mixture in procedure 2 was chosen to effect significant inhibition in the pyrophosphate-buffered experiments)

The information at hand indicates that formation of the enzyme-chlorpromazine complex proceeds through a relatively slow reaction, and that once the complex has formed, it is not easily reversible One could visualize a limited structural analogy between the N-alkyl substituted phenothiazine moiety of chlorpromazine and the N-ribityl substituted *iso*alloxazine component of flavin adenine dinucleotide, which may account for both (1) the stability of the chlorpromazine-enzyme complex and (2) the preferential affinity of the *free* apoenzyme for flavin adenine dinucleotide

In comparative experiments with nicotinic acid, which is known to effect inhibition by reversible competition with *d*-alanine for the combined apo- and co-enzyme[7], the chlorpromazine inhibition was approximately of the same magnitude as that of the reference reagent (procedure 1, phosphate buffer, *p*H 6 88) The nicotinic acid inhibition, however, was not affected significantly by the type of buffer, concentration of flavin adenine dinucleotide or pre-incubation (see Table 2, and Fig 2)

In conclusion, it should be noted that reserpine, Hoffmann-LaRoche's *Ro*-1-9569/7, *d*-lysergic acid diethylamide and cocaine had no significant effects upon *d*-amino-acid oxidase systems (procedure 1) optimal for chlorpromazine inhibition

We gratefully acknowledge the valuable suggestions of Drs John M Reiner and James A Bain

EQUILIBRIUM CONSTANT OF THE GALACTOKINASE REACTION AND FREE ENERGY OF HYDROLYSIS OF ADENOSINE TRIPHOSPHATE

By Dr. M R ATKINSON, ELEANOR JOHNSON and Prof R K MORTON
Department of Agricultural Chemistry, Waite Agricultural Research Institute, University of Adelaide

THE adenosine triphosphate–adenosine diphosphate system appears to be a universal component of living cells, and is required for activation and utilization of most metabolites A reliable estimate of the free-energy change for hydrolysis of adenosine triphosphate is therefore needed for evaluation of the energetics of the processes concerned with cell growth and maintenance Early estimates, based on thermal data and some equilibrium constants, indicated that the standard free-energy change ($\Delta G'$) for the reaction

$$\begin{matrix}\text{adenosine}\\\text{triphosphate}\end{matrix} + \text{water} \rightarrow \begin{matrix}\text{adenosine}\\\text{diphosphate}\end{matrix} + \text{orthophosphate} \quad (1)$$

was between -9 and -12 kcal /mole at *p*H 7 (ref 1). More recently, the free-energy change for this reaction has been calculated from the equilibrium constants of a number of phosphoryl transfer reactions and less negative values (-5 to -8 kcal /mole at *p*H 7) have been reported[2-4] The discrepancies between published values are due chiefly to the difficulty of accurately determining the equilibrium concentrations of the minor components of reactions for which the change of free energy is large

The free-energy change of reaction (1) may be obtained as the sum of the free energies of phosphoryl transfers from adenosine triphosphate to hexoses, and from hexose phosphates to water Previous workers[2,3] have used the reactions catalysed by hexokinase, that is

$$\begin{matrix}\text{adenosine}\\\text{triphosphate}\end{matrix} + (\alpha+\beta)\text{-D-glucose} \rightarrow \begin{matrix}\text{adenosine}\\\text{diphosphate}\end{matrix} + (\alpha+\beta)\text{-D-glucose-6-phosphate} \quad (2)$$

and by phosphatase, that is

$$(\alpha+\beta)\text{-D-glucose-6-phosphate} + \text{water} \rightarrow (\alpha+\beta)\text{-D-glucose} + \text{orthophosphate} \quad (3)$$

However, these reactions are inconvenient because of the large free-energy change (−2 9[2] or −4 4[3] kcal/mole at pH 7) of reaction (2) For the reaction catalysed by phosphoglucomutase, that is

$$\alpha\text{-D-glucose-1-phosphate} \rightarrow (\alpha+\beta)\text{-D-glucose-6-phosphate} \quad (4)$$

the free-energy change is −1 7 kcal/mole at pH 7 and 25° C [5] It is evident that the equilibrium constant of phosphoryl transfer from adenosine triphosphate to carbon 1 of hexose may be more accurately measured than that of phosphoryl transfer to carbon 6

In the present work, the equilibrium constant of the reaction catalysed by galactokinase, that is

$$\begin{matrix}\text{adenosine}\\ \text{triphosphate}\end{matrix} + (\alpha+\beta)\text{-D-galactose} \rightarrow \begin{matrix}\text{adenosine}\\ \text{diphosphate}\end{matrix} + \alpha\text{-D-galactose-1-phosphate} \quad (5)$$

has been measured

The reaction was carried out at pH 7 0 and 25° C with 25 mM magnesium chloride, which gave an excess of Mg^{2+} at the concentrations of nucleotides used The initial reactants were adenosine triphosphate and galactose, or adenosine diphosphate and α-D-galactose-1-phosphate The course of the reaction was followed by measurement of acid or alkali uptake at pH 7 0 after addition of yeast galactokinase and muscle adenylate kinase The latter enzyme catalyses the reaction

$$\begin{matrix}2\ \text{adenosine}\\ \text{diphosphate}\end{matrix} \rightarrow \begin{matrix}\text{adenosine}\\ \text{triphosphate}\end{matrix} + \begin{matrix}\text{adenosine}\\ \text{monophosphate}\end{matrix} \quad (6)$$

and facilitates accurate measurement, by keeping the ratio adenosine triphosphate/adenosine diphosphate close to unity Nucleotides were estimated by specific enzymic and electrophoretic methods, hexose phosphates were measured enzymically and hexoses by enzymic and colorimetric methods[6]

As shown in Table 1, the equilibrium constant for reaction (5) in the forward direction was 25 ± 3, and in the reverse direction was 27 ± 3 In a preliminary series of six experiments (with 10 mM magnesium chloride), the equilibrium constant was 25 ± 9 The standard free-energy change of reaction (5) is therefore −1 9 ± 0 1 kcal/mole at pH 7 0 and 25° C in the presence of an excess of magnesium ions

The free-energy change of the reaction

$$\alpha\text{-D-galactose-1-phosphate} \rightarrow \alpha\text{-D-glucose-1-phosphate} \quad (7)$$

is −0 7 kcal/mole[7] This reaction involves conversion of the axial hydroxyl group at carbon 4 to an equatorial configuration, and the free-energy does not differ significantly from that of the corresponding transformation in other compounds[8,9] Hence the free energy of hydrolysis of α-D-galactose-1-phosphate and α-D-glucose-1-phosphate must be independent of the orientation of the remote hydroxyl at carbon 4 The free energy of hydrolysis of α-D-galactose-1-phosphate has therefore been estimated from the free-energy changes of reactions (3) and (4)

The equilibrium constant of reaction (3) was determined in both directions at pH 7 0 and 25° C in the presence of Mg^{2+} and purified intestinal alkaline phosphatase[10] As shown in Table 2, the free-energy change of reaction (3) is −3 3 ± 0 1 kcal/mole in these conditions This is in agreement with the value obtained by Meyerhof and Green[11] with more concentrated reactants, but is 0 7 kcal/mole more negative than the value reported by Gumodman[12]

The equilibrium constant of reaction (4) was also measured in both directions at pH 7 0 and 25° C in the presence of Mg^{2+} and purified muscle phosphoglucomutase[10] As shown in Table 3, the free-energy change of this reaction was −1 7 ± 0 1 kcal/mole Colowick and Sutherland[5] also obtained a value of −1 7 kcal/mole for this reaction

For the hydrolysis of α-D-galactose-1-phosphate, that is

$$\alpha\text{-D-galactose-1-phosphate} + \text{water} \rightarrow (\alpha+\beta)\text{-D-galactose} + \text{orthophosphate} \quad (8)$$

the free-energy change at pH 7 0 and 25° C in the presence of an excess of Mg^{2+} is therefore −5 0 kcal/mole

From this value, and the free-energy change of reaction (5), the free energy of hydrolysis of adenosine

Table 1 EQUILIBRIUM CONSTANT OF REACTION (5) CATALYSED BY GALACTOKINASE (ref 6)

Initial reactants	Concentration (mM) of products at pH 7 0, 25° C and 25 mM Mg^{2+}*				K†	$\Delta G'$‡ (kcal/mole)
	Galactose	Galactose-1-phosphate	ATP	ADP

ADP and α-D-galactose-1-phosphate	0 37 ± 0 04 (8)	6 1 ± 0 1 (8)	1 51 ± 0 04 (4)	2 49 ± 0 01 (4)	27 ± 3	−1 9 ± 0 1

* Results given as mean ± S E, with the number of determinations in parentheses

† $K = \dfrac{[\text{ADP}]\,[\alpha\text{-D-galactose-1-phosphate}]}{[\text{ATP}]\,[(\alpha+\beta)\text{-D-galactose}]}$

‡ $\Delta G' = -RT\ln K$

Table 2 EQUILIBRIUM CONSTANT OF REACTION (3) CATALYSED BY PHOSPHATASE (ref 10)

Initial reactants	Concentrations (mM) of products at pH 7 0, 25° C				K*	$\Delta G'$ (kcal/mole)
	Orthophosphate	Glucose	Glucose-6-phosphate	Mg^{2+}		
Glucose and orthophosphate	163	151	0 074	0	332	−3 5
	248	214	0 200	2	266	−3 3
	246	239	0 225	5	261	−3 3
Glucose and orthophosphate and glucose-6-phosphate (approx 1 mM)	240	248	0 33	2	181	−3 1
	167	253	0 156	2	271	−3 3

* $K = \dfrac{[(\alpha+\beta)\text{-D-glucose}]\,[\text{orthophosphate}]}{[(\alpha+\beta)\text{-D-glucose-6-phosphate}]}$

Table 3 EQUILIBRIUM CONSTANT OF REACTION (4) CATALYSED BY PHOSPHOGLUCOMUTASE (ref 10)

Initial reactants	Concentrations (mM) of products at pH 7 0, 25° C and 25 mM Mg^{2+}		K*	$\Delta G'$ (kcal / mole)
	($\alpha+\beta$)-D-glucose-6-phosphate	α-D-glucose-1-phosphate		
Glucose-6-phosphate	13 6	0 77	18	−1 7
Glucose-1-phosphate	12 6	0 90	14	−1 6
Glucose-6-phosphate and glucose-1-phosphate	2 09	0 11	19	−1 7

$$*K = \frac{[(\alpha+\beta)\text{-D-glucose-6-phosphate}]}{[\alpha\text{-D-glucose-1-phosphate}]}$$

triphosphate at pH 7 0 and 25° C in the presence of an excess of Mg^{2+} is −6 9 kcal /mole The standard error for this value is probably less than 0 2 kcal / mole

Benzinger, Kitzinger, Hems and Burton[4] have recently determined the free-energy change for the hydrolysis of glutamine, that is

$$\text{glutamine} + \text{water} \rightarrow \text{glutamate} + \text{ammonia} \quad (9)$$

Combination of their value with estimates by other workers[13,14] of the free-energy change of the reaction

$$\begin{matrix}\text{adenosine}\\ \text{triphosphate}\end{matrix} + \text{ammonia} + \text{glutamate} \rightarrow \begin{matrix}\text{adenosine}\\ \text{diphosphate}\end{matrix} + \text{glutamine} \quad (10)$$

indicates that the free-energy change of reaction (1) is −6 8 kcal /mole at pH 7 0 and 25° C in the presence of an excess of Mg^{2+}

By combination of the free-energy change of reaction (3) as reported here (−3 3 kcal /mole) and the free-energy change of reaction (2) as estimated by Robbins and Boyer[3], and by Vladimirov, Vlassova, Kolotilova, Lyzlova and Panteleyeva[2], the estimates of the free-energy change of reaction (1) at pH 7 0 and 25° C in the presence of an excess of Mg^{2+} are −7 7 kcal /mole and −6 2 kcal /mole, respectively

Biological phosphoryl transfers take place in the presence of Mg^{2+} and hence the free-energy values reported here are more relevant for energetics of physiological processes than the much more negative values obtained in the absence of Mg^{2+}

The free energies of phosphoryl transfers from adenosine triphosphate to many other metabolites are known By combining these values with the value of the free energy of hydrolysis of adenosine triphosphate established here, reliable estimates of the free energies of hydrolysis of most phosphorylated metabolites have now been obtained[15,16]

A full account of the work described here will be submitted for publication elsewhere[6,10,16] We wish to thank Dr R M Burton, Washington University, St Louis, for generously supplying the purified galactokinase used in these studies

COMPLEMENTATION AMONG THE SUB-GENIC MUTANTS IN THE *r*-LOCUS OF *DROSOPHILA MELANOGASTER*

By DR. O G FAHMY and DR MYRTLE J FAHMY

Chester Beatty Research Institute, Institute of Cancer Research Royal Cancer Hospital, London, S W 3

THE composite nature of the gene, both as regards structure and function, has been admirably demonstrated by Benzer's[1] work on the *r*-II locus of the T_4 bacteriophage That complex genes are of widespread (if not universal) occurrence has also been demonstrated by the discovery of pseudoallelic series in a great diversity of organisms *Aspergillus*[2], *Neurospora*[3], and *Drosophila*[2,4] The description of the various attributes of a gene naturally necessitated a new terminology, which has now been adequately formulated by Benzer[1] He differentiated between the unit of recombination the 'recon', the unit of mutation the 'muton', and the unit of function the 'cistron' Two mutants within a locus are assigned to the same cistron if they express the mutant phenotype in the *trans* position, that is, when occurring in repulsion on the homologous chromosomes The corollary to this situation is the *cis* arrangement when the two mutants are in coupling on a member of a pair of homologues, with the non-mutant allelomorphs on the other, and this exhibits the 'normal' or wild-type phenotype Applied to *Drosophila*, this terminology means that a pair of pseudoallelic mutants occur in the same cistron if they give an interaction phenotype (that is, exhibit the mutation) in the F_1 heterozygote Conversely, the interallelic mutants are in different cistrons if they give complementation in the F_1, expressing the wild-type phenotype Inter-allelic complementation has been discovered in *Drosophila* at the *rudimentary* locus, and this phenomenon will be analysed in this communication

Induction of the Mutants

In the course of our work[5] on the induction of sex-linked recessive visibles by radiation, as well as a

Table 1 DISTRIBUTION OF THE MUTANT TYPES AND THE AFFECTED CISTRONS UNDER VARIOUS MUTAGENS

Cistrons	I	I + II	II + III	III	IV + V	V	VI	I – IV	I – VI	Total
Mutant types	*a*	*e*	*g*	*b*	*f*	*c*	*d*	*h*	*i*	
Mutagens

Alkyl methanesulphonates (*CB* 1506, 1522, 1528, 1540, 2041)	—	—	—	—	1	4	1	1	7	14
Phenylethylamine mustard (*CB* 3034)	—	—	—	—	—	1	—	—	2	3
X-rays	—	—	—	—	—	—	2	—	2	4
Stock *r* (spontaneous)	—	—	—	—	—	1	—	—	—	1
Total	4				27					31

diversity of alkylating mutagens (chloroethylamines, polyethyleneimines, and methanesulphonic esters), a total of 68 mutants at the *rudimentary* (*r*) locus were recovered. Of these, 31 mutants were retained for the inter-allelic tests. A few of the mutants analysed were induced by X-radiation, the remainder were induced by various alkylating compounds (Table 1). These compounds, together with their Chester Beatty (*CB*) code numbers and chemical names, will be listed here under their appropriate chemical series.

Amino-acid mustards: *CB* 1592, S-2-chloroethylcysteine, *CB* 3007, 3025 and 3026, the DL-, the L-, and D- isomers of *p*-NN-di-(2-chloroethyl)aminophenylalanine.

Phenylethylamine mustard: *CB* 3034, *p*-NN-di-(2-chloroethyl)aminophenylethylamine.

Alkyl methanesulphonates: *CB* 1506, 2-chloroethyl methanesulphonate, *CB* 1522, 2-fluorethyl methanesulphonate, *CB* 1528 ethyl methanesulphonate, *CB* 1540, methyl methanesulphonate, *CB* 2041, 1 : 4-dimethanesulphonoxybutane.

Phenotypically, all the *r* mutants were fairly comparable, and in general they resembled the stock visible which has already been described in the literature[6]. The hemizygous *r* males, as well as the homozygous females, were characterized by short obliquely truncated wings, with sparse costal bristles. When allelism tests were undertaken between the various mutants, however, it became apparent that we were dealing with a pseudo-allelic series, probably involving several functional sub-units (cistrons). Some of the mutants gave the *r* phenotype in the heterozygote, while others resulted in full complementation, giving the wild type.

The Complementation Map

Extensive analysis was undertaken of the phenotypic expression of crosses involving 31 *r*-alleles, and this enabled the construction of the complementation map illustrated in Fig. 1. It was possible to arrange the mutants in a unique linear sequence involving different or adjacent cistrons. In the construction of this map, mutants which complemented were assigned to different functional units (cistrons). Thus mutants *a*, *b*, *c* and *d* (Fig. 1) complement in pairs and, therefore, belong to different cistrons. This fact by itself, however, does not permit any determination of the sequence of the affected sub-genes. The detection of the intra-locus linear organization is made possible through the presence of mutants resulting from multiple 'inactivations' (or damage), extending over more than one cistron. For example, mutant *e* interacts with *a*, but complements *b*, while *h* interacts with *a* and *b*, but complements *c*. This fixes the position of *b* between *a* and *c*.

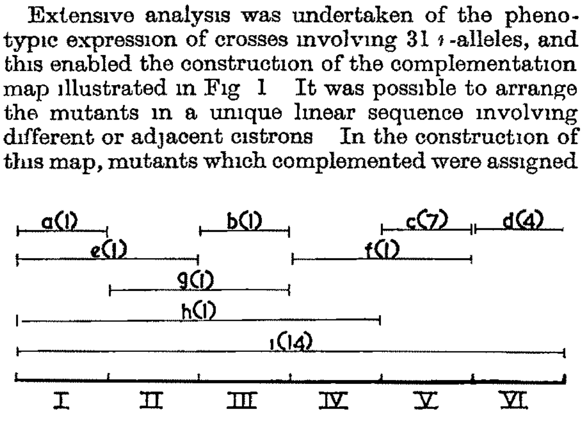

Fig. 1. Complementation map of the *r*-locus. The number of mutants in each category is indicated in brackets

The whole of the complementation map suggests the presence of at least 6-cistrons in the *r*-locus (Fig. 1). The majority of the mutants seem to involve more than one functional unit. Nearly half (14 out of the tested 31) are of the *i* type, involving all the 6-cistrons, and giving non-complementation to all other mutational types. These were at first thought to be small deficiencies at the *r*-locus. Careful cytological analysis of a non-complementing mutant (of the *i* type), however, failed to reveal even a single band deficiency in the salivary X-chromosome. According to the accepted criteria in *Drosophila* cytogenetics, therefore, even the multiple-cistron *r*-mutants must be looked upon as intra-genic point mutations. It is of interest to note that in *Neurospora*, as in *Drosophila*, non-complementing inter-allelic mutants were frequent, and did not prove to be the consequence of deletions[7]. Some of these mutants at the *al*-4 locus of *Neurospora* underwent reversion by back-mutation, and afterwards yielded secondary forward mutants of the complementing types.

A phenotypic manifestation which has some bearing on the complementation map is the appearance of the costal wing-setæ, or marginal bristles. In some inter-mutant heterozygotes the phenotype is wild-type, except for the derangement and sparsity of the marginal wing bristles. This suggested a situation of 'partial' complementation, which was designated ($r^{+}b$) indicating an intermediate state between interaction giving the (*r*) phenotype and full complementation giving the (r^{+}), or wild-type expression. If this is so, it would be expected that the ($r^{+}b$) effect should have some bearing on the complementation relations between mutants, giving some indication of the proximity of the complementing types. Table 2 gives the F_1 phenotypic expression of crosses between complementing mutants in relation to the inter-mutant distance in terms of functional units (cistrons). It is convincingly clear that the proportion of ($r^{+}b$) decreases with the distance between the mutants, and completely disappears for alleles 3 or more cistrons apart. It is therefore certain that the ($r^{+}b$) phenotype is an indicator of proximity among the complementing mutants. In

Table 2 THE EXPRESSION OF THE 'BRISTLE-EFFECT' (r^+b) IN 92 INTER-ALLELIC CROSSES BETWEEN COMPLEMENTING r-MUTANTS IN RELATION TO INTER-MUTANT DISTANCE IN CISTRONS

Distance (in cistrons)	(r^+)	(r^+b)	Total	Proportion (r^+b)
0	23	19	42	0 45
1	13	6	19	0 32
2	12	4	16	0 25
3	11	0	11	0 00
4	4	0	4	0 00

fact it is on the basis of this criterion that mutant type *d* has been placed nearest to *c* (Fig 1). This is because crosses between *c*- and *d*-mutants give the (r^+b) phenotype with the frequency expected for mutations affecting nearby cistrons On the other hand, crosses of mutants *d* × *a* and *d* × *e* all gave full complementation

The sample of *r*-mutants tested is much too small to permit an analysis of the distribution of the affected cistrons under individual mutagens Nevertheless, when mutations by groups of related compounds are considered, certain suggestive tendencies become apparent (Table 1) The mutants under the amino-acid mustards seem to form a class of their own, appreciably distinct from the rest of the sample induced by the other agents The small mutants (involving 1 or 2 cistrons) in the amino-acid mustard class show a larger scatter among the cistrons of the locus In particular, 4 out of the 9 mutants in this class involved cistrons I to III, while none of the 22 mutants by all the other agents involved these cistrons individually, or in pairs On the contrary, small mutations by agents other than the amino-acid mustards seem to occur exclusively in cistrons IV–VI Even with the small samples of mutants available, a comparison of the above relative frequencies (that is, 4/9 compared to 0/22) did indicate a difference of decisive statistical significance ($P < 0\ 01$) The lack of small mutants in cistrons I–III in the sulphonate sample as compared to that of the amino-acid mustards (that is, 0/14 compared to 4/9) also indicated a suggestively high difference ($P < 0\ 05$) There is, therefore, some indication of a difference in the mode of action of the amino-acid mustards and the sulphonates on the sub-genic level, which recalls that which has been demonstrated on the genic level[5] Experiments are now in progress to test the reality, and the degree, of the differential action on the *r*-cistrons under the effect of an individual compound belonging to each of the mutagenically contrasting chemical series · the amino-acid mustards and the sulphonates

Mechanism and Significance of Allelic Complementation

Intra-genic complementation is a fairly widespread phenomenon in micro-organisms The best-known examples occur at the *ad*-4[7,8] and *arg*-2[9] loci of *Neurospora*, but instances have also been reported in *Aspergillus*[10], as well as in *Salmonella*[11] The physiological mechanism of complementation has now been adequately analysed[7,8] for the *ad*-4 locus of *Neurospora* Extensive quantitative measurements of adenylosuccinase activity in complementing heterocaryons indicated that this activity ranges from 1 to 25 per cent that found in the parental strain Further, a correlation existed between enzymatic activity and the distance between the mutants on the complementation map Activity was maximal (that is, 25 per cent) for mutants separated by 4–6 cistrons, and fell gradually for nearer mutants, reaching a minimum when the damage occurred at juxtaposed cistrons This biochemical situation in *Neurospora* is parallel to the phenotypic 'bristle-effect' occurring among some of the complementing *r*-mutants in *Drosophila*, and suggests an analogous physiological mechanism It would seem likely that the (r^+b) phenotype is the outcome of a weak production of the r^+ 'determinant' (presumably an enzymatic complex), and that the amount of this 'determinant' increases with the distance between the damaged sub-loci in the heterozygote The disappearance of the 'bristle-effect' when the damaged sub-units are 3 or more cistrons apart indicates that this is the minimal distance (in physiological units) which is needed before enough 'r^+ determinant' is produced to manifest the wild-type expression It would be fascinating to determine the minimal distance for full phenotypic complementation in terms of physical entities (nucleotides) as well as in genetical (cross-over) units So far, this has not been achieved either in *Neurospora* or in *Drosophila* That this is within the scope of genetical techniques is indicated by some recent results[12] on the *pan*-2 locus of *Neurospora*, which show a correlation between order on the complementation map and the genetic distance in cross-over units The analysis of the genetic map of the *r*-locus in *Drosophila* is now under investigation

The complementation map here described for the *r*-locus of *Drosophila* is the first instance of this phenomenon discovered in higher organisms Evidence of intra-locus complementation, however, has already been detected in our laboratory at two other *X*-chromosome loci *tan* (*t*) and *minutechaete* (*mch*), and doubtless it must occur in many others The occurrence of inter-allelic complementation in organisms ranging from bacteria to *Drosophila* emphasizes that it is a fundamental characteristic of gene structure and function It implies that the linear sequence of the hereditary units is not only applicable to the arrangement of genes on chromosomes, but also is probably equally true of the ultimate organization of the genic substructure in terms of cistrons and nucleotides

We wish to thank Mr J Maynard-Smith (University College, London) for his interest in this problem, and also for his helpful discussion

This investigation has been supported by grants to the Chester Beatty Research Institute from the British Empire Cancer Campaign, the Jane Coffin Childs Memorial Fund for Medical Research, the Anna Fuller Fund, and the National Cancer Institute of the National Institutes of Health, U S Public Health Service

FORTHCOMING EVENTS

*(Meeting marked with an asterisk * is open to the public)*

Tuesday, December 29

Radar and Electronics Association (at the Royal Society of Arts, John Adam Street, Adelphi, London, W C 2), at 7 30 p m —Dr K R Sturley "High Quality Sound Broadcasting" *

Wednesday, December 30

Royal Society of Arts (at John Adam Street, Adelphi, London, W C 2), at 2 30 p m —Dr J D Carthy "Animal Senses and Reactions" (First of two Juvenile Lectures Further lecture on January 6)

Institution of Electrical Engineers (at Savoy Place, London, W C 2), at 3 p m —Mr G G Gouriet 'Colour Television" (Christmas Holiday Lecture To be repeated on Thursday, December 31)

Friday, January 1

Plastics Institute (in the Lecture Theatre of the Institution of Electrical Engineers, Savoy Place, London, W C 2), at 2 30 p m —Dr N A de Bruyne "Sticky Plastics" (Sixth Lecture for Young People)

APPOINTMENTS VACANT

Applications are invited for the following appointments on or before the dates mentioned

Lecturer (preferably with an interest in the theory of machines, mechanical servomechanisms or the strength of materials) in Mechanical Engineering—The Secretary, The Queen's University, Belfast (January 1)

Senior Lecturer in Clinical Biochemistry at the University of Melbourne, Australia—The Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W C 1 (January 4)

Senior Lecturer (with an honours degree and, preferably, a higher degree in electrical engineering, with specialization in electronics) in Electrical Engineering—The Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W C 1, or The Registrar, University of Queensland Brisbane, Queensland, Australia (Australia and London, January 15)

Lecturer in Biochemistry in the Department of Surgery to work on problems related to the formation of pre-collagen and collagen in wound healing—Joint Clerk to the University Court, Queen's College (University of St Andrews), Dundee (January 16)

Lecturer/Senior Lecturer in Nutrition to undertake teaching and research in livestock nutrition in the Department of Nutrition and Chemical Pathology, Faculty of Rural Science, University of New England, Australia—The Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W C 1 (Australia, January 20)

Assistant Lecturer in Statistics, to teach theoretical statistics and some mathematics—The Secretary, The London School of Economics and Political Science, Houghton Street, Aldwych, London, W C 2 (January 22)

Babcock and Wilcox Fellow in Nuclear Engineering—The Registrar, Queen Mary College (University of London), Mile End Road, London, E 1 (January 30)

Coal Petrologist (graduate majoring in geology or with equivalent qualifications, and considerable experience in the field of coal petrology) in the Coal Research Section, Commonwealth Scientific and Industrial Research Organization, Sydney, New South Wales, Australia, to carry out investigations on the microscopy of coals and cokes—The Chief Scientific Liaison Officer, Australian Scientific Liaison Office, Africa House, Kingsway, London, W C 2, quoting Appointment No 480/324 (January 30)

Senior Tutor-Demonstrator in Physics at the University of Sydney, Australia—The Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W C 1 (Australia, January 30)

Senior Lecturer/Lecturer in Chemical and Extraction Metallurgy at the University of New South Wales, Australia—The Agent General for New South Wales, 56–57 Strand, London, W C 2 (Australia, January 31)

Lecturer or Assistant Lecturer (with a special interest in climatology and/or biogeography and prepared to take part in the teaching of practical cartography) in Geography—The Secretary and Registrar, The University, Southampton (February 1)

Lecturer or Assistant Lecturer (with a special interest in some aspect of systematic botany, preferably in experimental taxonomy of vascular plants or paleobotany) in Botany—The Secretary and Registrar, The University, Southampton (February 1)

Lecturer (with a good university degree and experienced in the teaching of physics and/or mathematics in schools) in Education—The Secretary and Registrar, The University, Southampton (February 1)

Chair of Physiology in the London Hospital Medical College —The Academic Registrar, University of London, Senate House, London, W C 1 (February 1)

Imperial Chemical Industries Research Fellows in Physics, Chemistry, Biochemistry, Engineering, Metallurgy and Pharmacology—The Registrar, The University, Liverpool (February 13)

Junior Lecturers (2) in Mathematics—Prof E C Titchmarsh, Mathematical Institute, The University, Oxford (February 20)

Entomologist (with a good honours degree in zoology or entomology, and preferably postgraduate research experience in forest or timber entomology) with the West African Timber Borer Research Unit, Kumasi, Ghana, to undertake studies of the biology, ecology and control of timber and lumber pests—The Director of Recruitment, Colonial Office, London, S W 1, quoting BCD 197/510/01T

SCIENTIFIC MAN-POWER PROBLEMS IN BRITAIN

THREE years ago, in October 1956, the Scientific Man-power Committee of the Advisory Council on Scientific Policy issued a report on scientific and engineering man-power in Britain, based on information collected from Government departments, including a survey carried out by the Ministry of Labour, with the help of the Social Survey, of all manufacturing establishments employing 500 workers or more, and on a sample of those employing between 100 and 499 A report now issued by the same Committee (see p 1982 of this issue of *Nature*) gives information about the numbers and employment of scientists and engineers in Great Britain at the beginning of 1959 and the changes which have occurred since 1956, including a review of forecasts by employers of their demand for scientists and engineers by 1962 This is based on information collected by the Ministry of Labour and National Service in the first three months of 1959 No attempt is made to re-assess the long-term demand as forecast in the earlier report, but an estimate is made of the number of scientists and engineers who will qualify during the next three years, and the short-term relation between supply and demand is examined Neither survey includes technologists with specialist qualifications in branches of applied science such as textiles, rubber or plastics unless they are also qualified scientists or engineers as defined for the purpose of the earlier survey As in that survey, the Ministry of Labour inquiry included private industry, nationalized industry and public corporations, central and local government (excluding education and the Armed Forces) and education Together these employments account for almost 90 per cent of all qualified scientists and engineers in Great Britain

At the beginning of 1959, the inquiry indicated that about 173,000 scientists and engineers were employed in Great Britain, an increase of rather more than one-fifth on the number employed in 1956, and a third of the increase for which, it was suggested, minimum provision should be made by 1966 About 20,000 of these are engaged on defence work, including one in four on research and development in industry and government establishments, and there is evidence that the proportion engaged on defence work has fallen during the past three years Between 1956 and 1959 the number of scientists and engineers employed in manufacturing industry increased by about 30 per cent, although industrial production was relatively stable The increase occurred mostly in those industries which have shown some increase in output during the period, and more particularly in the newer industries which have expanded rapidly since the War, and which employ relatively larger numbers of scientists and engineers Investment during the period has been high, and about two-fifths of all scientists and engineers in industry are employed on research and development work which can be expected to show results in the longer term

According to the statements of employers, there were immediate vacancies for about 9 per cent more scientists and engineers at the beginning of 1959, and if these vacancies had been filled the total employed would have approximated closely to the forecast of requirements the employers made in 1956 There were, nevertheless, wide divergencies between forecast requirements and actual recruitment in industrial groups, while apart from unforeseen economic and technological changes, some employers were not in as strong a position as others to compete for the qualified scientists and engineers they wished to recruit While in the technical colleges the increase in the number of teachers has kept pace with the most recent estimates of demand, in the schools there has been a relatively greater increase in the number of boys and girls studying science than in the number of science teachers In the grammar schools the continued increase in the number of teachers has been just about sufficient to maintain standards of teaching science, notwithstanding the increase in the number of those studying science in the sixth forms, but many schools have had to face serious difficulties

These figures may well be considered here in detail, for the educational position is the critical factor In 1959, some 33,650 scientists and engineers were teaching in universities, technical and teacher training colleges, and schools. Omitting a group of 1,300 engineers in technical colleges and 370 teachers in independent schools, the total of 31,980 compares with 28,040 in 1956, and of these, 4,175 were teaching in the universities, 5,560 in the technical and teacher training colleges, and 22,245 in the schools While, however, the actual increase in the technical and teacher training colleges was 23 per cent compared with 14 per cent forecast, in the universities it was 28 per cent compared with 33 per cent forecast, and in the schools only 10 per cent compared with 18 per cent forecast, and an increase of 18 per cent in the number of secondary school pupils There is evidence that teachers of mathematics are scarce, while the supply of biology teachers appears to have at least kept pace with demand Nevertheless, the survey shows that the shortage of scientists is still most acute in the schools, and since the returns received from employers indicate no slackening at present in the demand for qualified scientists and engineers, the continuing shortage of suitably qualified teachers is likely to remain a matter of serious concern

Indeed, in secondary schools other than grammar schools, the growth in the number of children and the efforts now being made to develop new courses are creating new demands so rapidly that there is little or no prospect in the next three years of maintaining even current standards, although the Man-power Committee considers that the position should improve afterwards In grammar schools it concludes that the experience of the past three years is likely to be repeated over the next three The Man-power Committee does not consider the implications of any change in policy directed to ensure that a larger proportion of school leavers have at least some general acquaintance with science and its methods, and it is left for the Advisory Council on Scientific Policy in its annual report, issued simultaneously with that of the Scientific Man-power Committee, to emphasize that inadequate school education in mathematics and the physical sciences will have detrimental repercussions on the efforts being made by the universities and technical colleges to increase the output of professional scientists and engineers

The Scientific Man-power Committee, apart from a word of caution as to how far the employers' statements constitute a real basis for an estimate of future demand, does not attempt any appraisal of the total on the lines of Prof J. Jewkes's analysis in his presidential address to Section *F* (Economics) at the British Association meeting at York. The questions which Prof Jewkes asked need to be kept in mind in considering both the forecast demand for scientists and engineers by 1962 and any measures proposed to provide a sufficient supply As already noted, immediate vacancies amount to about 9 per cent of the 63,581 employed in private manufacturing industry at the beginning of 1959, and all employers together hope for an increase in numbers of 38,700 by 1962, or a total increase of 22 per cent, while a further 14,600 will be required to replace losses from retirements, deaths and migration.

In its previous report, the Man-power Committee estimated that the annual flow of qualified scientists and engineers from the universities, professional institutions and technical colleges would have to increase from just over 10,000 in 1954–55 to about 20,000 by 1970 to be compatible with the number of scientists and engineers which is thought to be required to sustain an acceptable rate of economic growth Present forecasts suggest that the number of scientists and engineers qualifying for the first time will increase from 14,600 in 1958 to 18,500, and that 47,500 newly qualified scientists and engineers will become available for employment in Great Britain during the three years 1959–61 The rate of increase during the past three years has been higher than was expected in 1956, and if it continues until 1966, the original target of 20,000 should be reached by the mid-1960's.

Nevertheless, after allowing for the replacement of wastage, the total numbers coming forward during the next three years are still likely to fall short of employers' estimates of their needs, and in particular the shortage of mathematicians, physicists and chemists is likely to continue. Of the 14,600 qualifying in 1958, about 5,700 were scientists and 8,900 engineers, and the rate of increase for engineers (from 6,800 in 1955) has been higher than for scientists (5,250 in 1955) While the Advisory Council for Scientific Policy sees no likelihood of the universities and colleges of technology training too many professional scientists and technologists, it has reservations as to particular categories, such as biology Biologists with specialized training in such fields as biochemistry or physiology are unlikely to encounter any difficulty in obtaining employment, but the average graduate in biology may well find the best opening in teaching, and the Advisory Council suggests that those who intend to study biology should be warned of the importance of supporting qualifications in mathematics or a physical science, and also of possible difficulty in obtaining posts in their subject unless they are outstanding or proceed to postgraduate training or specialization

The Advisory Council on Scientific Policy agrees with the Scientific Man-power Committee that experience of three years is an insufficient basis for detailed re-assessment of the long-term demand However, the picture presented in this report shows a welcome trend of a higher rate of growth in the employment of scientists and engineers than had been expected, and also a higher output of trained men, but there is still much work to be done before an accurate picture can be obtained Nor is this solely a matter of seeking answers to some of the questions which Prof Jewkes has raised Even if it is shown that industry's estimates and forecasts are excessively high, and that there is considerable scope for economy through the more efficient use of scientists and technologists, that could be largely offset by one aspect which is not covered by the report, although it is clearly very much in the mind of the Advisory Council on Scientific Policy, namely, the demand from overseas for British scientists and technologists

MYTH AND RITUAL

Myth and Ritual in the Ancient Near East

An Archæological and Documentary Study. By Prof E O James Pp 352 (London Thames and Hudson, Ltd , 1958) 35*s* net

DURING the past quarter of a century and more, British scholarship has played an outstanding part in the investigation of the problems of myth and ritual in the ancient Near East, as is shown by the successive symposia edited by S H Hooke, namely, "Myth and Ritual" (1932), "The Labyrinth" (1935), "Myth, Ritual and Kingship" (1958) To the third of these volumes two foreign scholars contributed, one of them a Swede, the British achievement thus being linked with the remarkable activity of Scandinavian scholars in the same field Now we have a wide-ranging study by a veteran student of religion, Prof E O James, which many will welcome as a most helpful guide through the tangled jungle of ancient religious belief and practice The author draws on the most recent archæological evidence—much of it makes very severe demands on the interpreter—from Egypt, Syria, Palestine and Mesopotamia, and from even farther afield, from the Ægean, Anatolia, Persia and Western India The notes and bibliography show how wide and thorough has been the research which lies behind this attractive volume

It is quite essential in work of this kind that careful attention should be given to the meaning of the terms used Prof James has much that is illuminating to say by way of defining the meaning of the word 'myth' Properly understood, myth is, in Malinowski's words, "a narrative resurrection of a primeval reality", which accompanies the ritual by which a body of people maintains its corporate life It has thus to be distinguished from folk-tales and *Marchen* and sagas which are told merely for purposes of entertainment, having lost their original religious function It is claimed, however, though the distinction is not made very clear, that a considerable body of myths exists apart from any ritual setting, those which we can class as ætiological, where the original ritual connexion has been forgotten or is no longer operative There are also the legends and sagas which embody the essential traditions of a people and eventually give birth to history and so are not to be classed as mere entertainment In these, myth has not yet ceased to be functional

The myths which form the subject-matter of the main inquiry are dealt with under various heads The beginnings of myth and ritual are studied with reference to the evidence of cave art and of the earliest literary sources Then follow six chapters which describe and discuss the seasonal cult drama, the sacral kingship—a subject which has rightly occupied the centre of interest in scholarly inquiry in this field —the mother-goddess and the sacred marriage, the myth and ritual of creation, good and evil and the sacred combat, and eschatological mythology Prof James follows Frankfort in recognizing that there is not identity of pattern in myth and ritual over the whole area under survey, but pleads for a fundamental similarity At the same time, he makes clear the distinctive use which Israel made of the ideas and practices which it borrowed The reader could not do better than read this book in conjunction with "Before Philosophy" by Frankfort *et al* (Pelican Books) and the first volume of Voegelin's monumental "Order and History" In much that is excellently expounded, Prof James is especially to be congratulated on his elucidation of the relation that existed between the Memphite, the Hieropolitan and other Egyptian theologies He perhaps shows more confidence than is justified in Ventris's claim to have deciphered the Minoan script Linear *B*

I have noted a few minor errors and slips On p 62 Enoch should be Enosh On p 65 the date of the fall of Samaria should be 722 and not 586, while it is scarcely correct to equate *berith* and cultus On p 66, line 6, 'later' should surely be 'earlier' (cf Leviticus 23 23 ff with I Kings, 12, 32–3) On p 69 read Hekatombaion On p 122 there is something wrong in the reference to Adonis grieving for Attis On p 125 it is odd to find Aleyan-Baal described as the mother of Mot On p 147 'Atum' should surely be read 'Ptah', while on p 271, 'Agamemnon' should be 'Priam' On p 267 the third sentence (ending with 'Gibeonites') is so inaccurate that it requires radical revision On pp 272–3 there seems to be a contradiction between two statements of the view in the Iliad regarding men's responsibility for the sufferings that afflict them

NORMAN W PORTEOUS

NUCLEAR TECHNOLOGY AND THE SCHOLARLY TRADITION

The Physical Theory of Neutron Chain Reactors

By Alvin M Weinberg and Eugene P Wigner Pp xii + 801 (Chicago University of Chicago Press, London Cambridge University Press, 1958) 112*s* 6*d* net

THE Geneva Conference in 1955 released a vast amount of information on nuclear technology and stimulated the publication of a large number of books and periodicals An appreciable fraction of these were, understandably but effectively, catalogues of materials or of reactor types, facts were paramount and reasons somewhat neglected Authors and teachers now have, as one of their tasks, to select from a large and expanding body of facts those which demonstrate most clearly the fundamental aspects of the subject For reactor technology a notable contribution to the organization of the fundamentals has been made by Weinberg and Wigner in this book The preface states explicitly that one of their aims is to help develop a scholarly tradition in reactor technology and both authors are, of course, well equipped for the task It is not surprising that Wigner, as the distinguished holder of a chair of theoretical physics, should embark on it, but we must feel grateful that Weinberg's duties as director of a large national laboratory have left him with sufficient energy and enthusiasm to collaborate

From the beginning it is clear that the 'physical' in the title is meant to be justified and fully one-quarter of the book is concerned with nuclear physics Obviously, the authors hold the view that an uncritical extrapolation from known cross-section data is becoming more prevalent and is highly undesirable To reduce this tendency they devote several chapters to a discussion of neutron interactions in general and to the fission process in particular For the newcomer to nuclear physics some preliminary guidance in the history of nuclear models would help the process of assimilation, but no such help is needed with the chapter on fission, it is a clear and succinct presentation of the main features

After dealing with the nuclear foundations, the book turns to chain reactions and to the moderation and diffusion of neutrons The short chapter on chain reactions introduces a change in terminology from that normally used "criticality factor" takes the place of "effective multiplication factor", and a new term, "finite multiplication factor" is introduced. The latter is concerned not with neutron leakage from finite systems but with the possible dependence of quantities such as resonance escape probability and thermal utilization on the size and shape of a reactor This dependence is weak, but the discussion of it is in keeping with the rigour exhibited in many parts of the book In view of this, it is a pity that there is a slip in the section on multiplication factors where these are stated to be less, instead of greater, than the criticality constant

Diffusion and transport theories for mono-energetic neutrons, and hence for thermal neutrons once the representative velocity has been selected, are presented in two long chapters The first shows clearly the assumptions involved in the use of diffusion theory and forms a valuable introduction to the study of neutrons in bulk materials The second presents Boltzmann's equation in various mathematical forms and discusses methods of solution. Chapters on the energy spectrum during moderation and on the diffusion and thermalization of fast neutrons complete the first half of the book, and any reader well acquainted with its contents is fully equipped to embark on the study of reactor theory which follows. Here the introductory chapters are concerned with unreflected homogeneous systems, both critical and sub-critical. Non-uniform reactors and reflectors follow and provide an opportunity for the introduction of two-group analysis; multi-group methods also are mentioned briefly. Up to this point the discussion has been concerned principally with the steady state, but the emphasis changes with the introduction of perturbation theory and with the treatment of reactor kinetics. The last chapter in the book deals with the theory of control rods but, before this is reached, heterogeneous reactors receive the thorough treatment which by this stage the reader is taking almost for granted.

J. WALKER

HETEROGENEOUS CATALYSIS

Advances in Catalysis and Related Subjects

Vol. 10. Edited by D. D. Eley, W. G. Frankenburg and V. I. Komarewsky. Pp. xvi+326. (New York: Academic Press, Inc.; London: Academic Books, Ltd., 1958.) 11 dollars; 88s.

THE preparation of this tenth volume of "Advances in Catalysis" has unhappily coincided with the death of two of the founding editors, W. G. Frankenburg and V. I. Komarewsky. Tributes to them appear appropriately at the beginning of the book. By maintaining a balance between the more academic and the more technical aspects of heterogeneous catalysis, and by allowing occasional excursions into homogeneous and biological catalysis, the editors have progressively encouraged the specialist to broaden his horizon. Vol. 10 carries this tradition further and is certain to add to the wide, international readership which the series already enjoys.

For the most part, the articles follow the pattern of earlier volumes by describing the contributions to knowledge of catalysis made over the years by individual groups, the accounts being written by one or more of the authorities concerned. Three of the seven articles ("The Infra-red Spectra of Adsorbed Molecules", by R. P. Eischens and W. A. Pliskin, "The Active Surface of Cholinesterases and their Catalytic Action in Ester Hydrolysis", by F. Bergmann, and "Commercial Alkylation of Paraffins and Aromatics", by E. K. Jones) also include sufficient description of related work in other laboratories to be classified as general reviews of the subjects indicated. The remaining four articles ("The Nature of Active Centres and the Kinetics of Catalytic Dehydrogenation", by A. A. Balandin, "The Influence of Crystal Face in Catalysis", by A. T. Gwathmey and R. E. Cunningham, "The Reactivity of Oxide Surfaces", by E. R. S. Winter, and "The Structure and Activity of Metal-on-Silica Catalysts", by G. C. A. Schuit and L. L. van Reijen) are comprehensive so far as the work of the originating laboratories is concerned, but rather selective in their coverage of parallel studies conducted elsewhere.

A. A. Balandin describes both the geometric and energetic aspects of his multiplet theory and applies it to a wealth of well-documented experimental data. Since most of his original papers are in Russian, this account in English is particularly valuable. F. Bergmann gives a well-presented development of the present status of knowledge on the arrangement of the components at the cholinesterase surface and on the mechanism of enzymatic hydrolysis. R. P. Eischens and W. A. Pliskin describe their own important infra-red studies on metal–silica and oxide catalysts; they also include, among other topics, a critique of the Russian work on the spectra of adsorbed hydroxyl radicals. A. T. Gwathmey and R. E. Cunningham largely confine themselves to a descriptive, but very well-illustrated, account of the selective reactivity of certain faces of copper and nickel single crystals in oxidation and in the presence of carbon monoxide, ethylene and hydrogen–oxygen mixtures. The article by E. K. Jones describes (with a rather unnecessary amount of jargon) the sulphuric and hydrofluoric acid processes for the production of high-octane fuels and also outlines the newer developments in the petrochemicals field afforded by alkylation methods. G. C. A. Schuit and L. L. van Reijen apply fundamental thermodynamic and kinetic treatments to their thorough experimental studies of adsorption and catalysis on nickel–silica and other supported metal catalysts, and E. R. S. Winter gives a full account of his valuable research on the application of oxygen-18 and carbon-13 isotopes in studies of adsorption, catalysis and oxygen exchange at oxide surfaces.

The volume, which is well produced, will be indispensable to all laboratories where there is active research in heterogeneous catalysis.

F. S. STONE

THE GENUS *OENOTHERA*

Taxonomy and Genetics of *Oenothera*

Forty Years Study in the Cytology and Evolution of the Onagraceae. By R. Ruggles Gates. (Monographiae Biologicae, Vol. 7.) Pp. 115. (The Hague: Dr. W. Junk, 1958.) 14 guilders.

THE genus *Oenothera* has been of considerable importance in the history of genetics and cytology, and Prof. Ruggles Gates has for many years been one of the most active students of the genus. His publications concerning the evening primroses have been numerous and it is useful to have an outline of the results summarized in one volume. Cytogenetically, species of *Oenothera* differ from the majority of plants the chromosome behaviour of which has been studied in that there is "pairing of the chromosomes at their end portions only". Thus are formed ring-pairs at meiosis. In addition, the evolutionary conditions in the genus are further complicated by non-disjunction, trisomics, polyploid mutations, genetic complexes, balanced lethals, self-sterility factors, self-pollination, and dominant mutations for smaller flowers. Since catenation, combined with the presence of balanced lethals, prevents the segregation of homozygotes in the offspring of a cross, there result plants which breed true although highly heterozygous.

The author has grown and studied hundreds of cultures of *Oenothera*. The resultant taxonomy, range, and distribution are given for a number of complexes, and culture variations are considered. The evolution of the genus is divided into two periods: first, the pre-Pleistocene, during which differentiation of the large-flowered open-pollinated species such as *O hookeri*, *O grandiflora* and *O argillicola* took place by ordinary methods, the chromosomes all remaining as free pairs , secondly, the Pleistocene and especially post-Pleistocene period, during which chromosome linkage took place, followed by the production of a great number of self-pollinating forms with small flowers as the genus spread northwards after the last retreat of the ice. Thus, the method of evolution appears to have changed radically during the evolution of the genus

The value given to the very numerous taxa, recorded by Prof Ruggles Gates and others, in any taxonomic scheme can only be judged fairly by one who has made a special study of *Oenothera* and allied genera Apart from the general true-breeding character of these taxa, it is certain that many differential characters are involved and that some or other of these are shown at all stages of the life-history from the young seedling to the final phases of reproduction It is none too clear, however, as to how the author determines taxa as species, micro-species, sub-species, varieties, etc It would have been interesting to have had from him at least working definitions of such categories as he uses within the genus *Oenothera*

W B Turrill

SCIENCE AND SCEPTICISM

The Way Things Are

By Prof P W Bridgman Pp. xi+333. (Cambridge, Mass : Harvard University Press , London . Oxford University Press, 1959) 45*s*. net.

IN this remarkable compilation the author gives us his views, frequently unorthodox, on Marxism, death, integrity, psycho-analysis, taxation, freewill, Red Indian languages, martyrdom, sovereignty, faith, military service, McCarthy, the economic status of the teaching profession, and the illogicality of women. Income tax provokes Prof. Bridgman's indignation as much as anything "To me the thing that is hardest to bear is the obvious inequity of it all I do not expect my neighbour to give to me of his goods because I need them more than he does—why should society compel me to give of my goods to society because society needs them more than I do, society being only all my neighbours together ? Every time I pay my income tax I smart under a sense of unfairness as keen as that of the old militant suffragette, denied the right to vote merely because of her sex I feel exploited and discriminated against on the basis of superior ability and industry. It is hard to keep away the bitterness."

The thread of the book is difficult to find, to understand and to follow Bridgman contends that there is an "ineptness" in our thinking in the natural sciences, in psychology, and in politics This is characterized in three main ways all observations affect their subject-matter, no system can fully account for itself (Godel's theorem is mentioned here), and all knowledge is private to the perceiver

We cannot, laments Bridgman, "get away from ourselves". Even mathematical proof, he says, is a personal matter which cannot be communicated, and so mathematics is even less "objective" than chemistry or physics If this is so, it is difficult to see how mathematics can be taught Bridgman's difficulties over subjectivism and solipsism appear to rest on a confusion between the acquisition of knowledge, which is a personal matter in the sense that a particular individual must make the observation, conduct the experiment or find the proof, and what it is that is found out, which may be as "objective" or "public" as you please Some of Bridgman's discussions of concepts in the natural sciences, such as "particle" or "probability" are interesting and helpful , but there is an ineradicable crankiness about the book which, in view of the distinction of both the author and the publisher, is as surprising as it is regrettable

THE UNIVERSITY OF LEICESTER

New University

By Prof Jack Simmons Pp 233+16 plates. (Leicester . The University Press, 1958) 12*s*. 6*d*. net

PROF SIMMONS has made an admirable contribution to the growing library of books about the origins of modern universities. His first chapter is a neat and concise account of the widespread movement which has multiplied the undergraduate population in England by nearly fifty in less than 150 years Against that background he tells with sympathy and candour the story of the University of Leicester

It was fitting that Leicester should become a university town, for it is ancient, prosperous, trim and clean , and by the beginning of the twentieth century there existed in it strands of educational life waiting to be brought together in a university pattern But it had rivals not far distant, and it needed "the liberality, the determination and the toughness" of a small group of men to set the pattern and weave the fabric.

The usual stages are recorded Press correspondence, a local committee, outside advice, and the dramatic acquisition of a building. Then came squalls · the questions of 'federation' with Nottingham, of the local nature of the projected University College, of delay in the appointment of a principal. But on October 4, 1921, the College opened its doors to nine students and a staff of four

In the following year it "made its formal bow to the public" and began to face the problems of adolescence It had no smooth path, financial or academic, during the next fifteen years, and there was discontent, both within it and about it But progress was made, until in 1945 the University Grants Committee recognized it for assistance from the Exchequer

This was in effect a second start, and by 1950 the University College had more than 700 students with ten professors and an energetic principal Building extensions and academic developments of considerable enterprise paved the way for independence , and in 1957 the charter of the University was granted

So the last of the 'old university colleges' attained adulthood, and joined the ancient and distinguished band of institutions which grant their own degrees in full academic independence Each of the members of this band has its own distinctive flavour Prof. Simmons has put us all in his debt by his modest and fascinating chronicle of the advances and setbacks, the struggles and the victories of this sturdy new member of the university family

J F Wolfenden

Maladies of Hevea in Malaya

By Roger N Hilton With watercolours by Hoh Choo Chuan Pp 101 (Kuala Lumpur Rubber Research Institute of Malaya, 1959) 30 Malayan dollars

THE reviewer feels he should make it clear at the outset that his acquaintance with *Hevea brasiliensis* as a plantation tree is limited to Trinidad, where the climate is not wholly suited to it and where it is accordingly little grown He has therefore no personal experience of the diseases as such, though many of the fungi figured are familiar in other contexts With these limitations he feels it difficult to criticize Mr Hilton's text Mr Hoh Choo Chuan's watercolours are outstanding no less for their beauty than for their extraordinary faithfulness and precision while their reproduction is of the highest quality Anyone who has tried to record white hyphæ and mycelial strands straying over living leaves will appreciate the skill displayed in, for example, the plates of thread blight and powdery mildew

Only diseases and injuries to *Hevea* already known in Malaya are figured These include fasciation, leaf malformation, genetic yellows, chlorosis, oil spot, leaf rim blight, sun scorch, heat scorch, lightning damage, fire damage, symptoms of herbicide poisoning, waterlogging and drought, brown bast, fissures of the tapping panel and bark burrs as well as troubles associated with fungi and with *Loranthus* spp Each plate is accompanied by a page of text on which information regarding the disease is summarized under the headings symptoms, cause, other hosts and spread (where a pathogen is involved), prevention and treatment The diseases are arranged under the following headings those affecting the whole plant, the roots, the stem and branches, the tapping panel, leaves of young plants and leaves of mature plants The point of view is severely practical throughout and the work should prove a valuable handbook to the rubber planter in the eastern tropics

R W G DENNIS

Theory of Beams

The Application of the Laplace Transformation Methods to Engineering Problems By T Iwinski Translated from the Polish by E P Bernat Pp 85 (London and New York · Pergamon Press, 1958) 21*s* net

FROM the point of view of the structural engineer with mathematical inclinations this is an interesting little book and it is likely to be stimulating to advanced students The solution of beam problems in practice has, however, long since been reduced to the judicious use of tabulated information and most problems can be dealt with rapidly in this way

It is stated that this monograph is the first part of a major project on the application of the Laplace transformation method to problems in the theory of structures Solution of the differential equation of uniform beams with linear elasticity and uniform loading by means of the Laplace transformation is demonstrated followed by generalization to include the effects of concentrated forces and couples It is shown that the solution always consists of two parts . one part depends upon the support or boundary conditions while the other depends upon the system of loading By taking account of this feature it is shown that the problem of determining the deflected form of a beam can be transformed from the solution of a differential equation to the solution of simultaneous algebraic equations Finally, the solution of the differential equation of beams with variable flexural rigidity and subjected to general conditions of loading is considered

T M CHARLTON

Potassium Symposium 1957

Sixteen Papers read at the Fourth Congress of the International Potash Institute, Vienna, 1957 Pp 420+4 plates (Berne International Potash Institute, 1959) n p

THE report published by the International Potash Institute as an outcome of its congresses, held annually from 1953 to 1956, covered many aspects of broad and general interest, potassium being considered from the aspect of agricultural chemistry throughout the various phases of the plant-soil system The theme of the last congress is more particularized and the main interest is in a varied assortment of species in close association, especially herbage plants The part played by potassium in the growth of herbage plants, legumes and grasses, is a complicated matter since numerous factors are involved The importance of grassland in agriculture justifies such a restricted interest and the papers cover some important aspects of it One of the topics was the influence of potassium fertilizers on animal production from pasture, another on their influence on the cultivation of irrigated prairies in Italy, and others on their application under widely differing external conditions of moisture and temperature These titles indicate the general field of interest in the congress The paper on the production of animals and pasture grazing led to a lively discussion on grass tetany

This volume, it will be seen, is mainly of agronomic interest and in its field it provides information of real value The papers are in English, French, German and Italian, in some cases full translations being provided, and in most cases summaries in English, German, French and Italian It is lavishly produced on thick glossy paper and has illustrations, some in colour, with an author index and subject indexes in English, German, French and Italian

The Cellular Slime Molds

By Prof John Tyler Bonner (Investigations in the Biological Sciences, No. 1) Pp viii+150+8 plates (Princeton, N J Princeton University Press, London Oxford University Press, 1959) 32*s* net

PRECEDED by a brief review of the Mycetozoa, this account of the Acrasiales, taking in all published work up to 1959, is divided into three sections corresponding to the biology, morphogenesis and genetics of this group Although many of the facts and concepts are already available in review form, this new synthesis should be useful to those who have to lecture on these topics and to those wanting a source book on developmental problems in relatively simple organisms Described on the cover as a monograph, the book lacks the objectivity and balance that is looked for in this form of writing, particularly in respect of the varying emphasis given to different aspects of our knowledge, and in the conjectural nature of much of the discussion It is towards the end of the book (p 133) that the author realizes "such speculation soon becomes hollow and unrewarding"

D PARK

Land and Water Bugs of the British Isles

By Dr T R E Southwood and Dennis Leston Pp xi+436+63 plates (London and New York Frederick Warne and Co, Ltd, 1959) 30*s* net

THIS book, the first published since 1892 to key all the British species of Hemiptera-Heteroptera, should be valuable both to the person who wishes to recognize and learn something about the occasional bug that crosses his path and to the student of the group The former will find the generally accurate coloured plates and black-and-white drawings will help him to recognize many of the species, while most of the keys are practical and not difficult to use Perhaps one exception is the key to the subfamilies of the Miridae (here the authors have my sympathy), which might be accompanied by a warning that the arolia and pseudo-arolia are not readily visible on carded specimens, also the term 'collar' is not accurately defined Some of the keys, too, might have more references, including pagination, to the text figures The keys and illustrations are usually sufficient for easy recognition the book gives no further description of the adult insect

Technical terms are generally used but are very well defined in the glossary Another useful feature is a list of plants in alphabetical order with references to the bugs usually associated with each There are also practical notes on collection, preservation and study

The specialist will find this book a valuable and up-to-date compilation of details of the biology and distribution of the species, amply substantiated by numerous references. The diploid chromosome complement is given, when known Confusion may sometimes be caused by the complete absence of synonyms in this book, a few of the new names being unfamiliar to many collectors

W. J. LE QUESNE

British Parasitic Fungi

A Host-Parasite Index and a Guide to British Literature on the Fungus Diseases of Cultivated Plants By W. C Moore Pp xvi+430 (Cambridge: At the University Press, 1959) 45*s* net

WHEREVER crops are grown the study and control of fungus diseases is of major importance This is reflected in the vast and scattered literature relating to diseases of economic plants Every time the plant pathologist finds a disease which is new to him he is faced with a time-consuming search through this literature, much of which may not be readily accessible This task will be greatly lightened for the British plant pathologist by the publication of Mr Moore's book The book is in two sections the first giving lists of recorded parasitic fungi, together with some actinomycetes, for every plant of any economic importance grown in Britain The second section lists the parasites alphabetically and for each gives the correct name and original reference, well-known synonyms and the common name(s) of the disease(s) caused For the more important diseases useful data relating to incidence and history and a list of the more important papers dealing with the various aspects of the disease are also given

Mr. Moore brings to the compilation of this book an unrivalled knowledge and practical experience of diseases of economic plants in Britain, and the book will be an indispensable and authoritative work of reference for all mycologists and plant pathologists. It is well arranged and clearly printed, so that any desired item can be turned up at once It will assuredly save many hours in the identification of plant diseases and the tracking down of the relevant literature

LILIAN E HAWKER

Rivers and Man

By Dr. Robert Brittain Pp 288+13 plates. (London and New York Longmans, Green and Co, Ltd, 1959) 21*s* net

THE changing relationship between rivers and men through time is a fascinating topic and well worthy of the attention of the wide audience aimed at by this book The writing is, to say the least, enthusiastic. The canvas used is a broad one and the picture has been executed in glaring colours The technically qualified will cringe many times as over-generalization follows over-generalization The book as a whole raises the perpetual problem as to how science may be popularized without sacrificing the truth The first chapter on the making of the world consists of a large number of undigested snippets of geological fact and fiction In dealing with archæological matters in the remaining ten chapters the author is more, in fact, much too plausible and uncritical. The impression gained is that archæology has no problems, that no one was ever in any doubt as to the meaning of evidence. Is this the kind of image of itself that science wishes to project? I think not

E H BROWN

Détecteurs de Particules (Compteurs et Scintillateurs)

Mécanisme et Réalisation Par Daniel Blanc Pp v+324 (Paris Masson et Cie, 1959) 3,900 francs

THE progress of experimental nuclear physics has been very dependent on the development of new experimental apparatus at the appropriate time In the case of detectors for nuclear particles, the new device is frequently in common use in the research laboratory long before the detailed mechanism of the detector is fully understood The book under review was intended to collect together for the French-speaking physicist our present knowledge of detectors Its completeness, therefore, makes it rather useful Although more complete treatises on particular detector types exist in English, no recent one includes all types as this book does Moreover, a useful balance is struck by M Blanc between the theories of detection mechanisms and the recipes for making workable devices

Rather more than half the book is devoted to ion-chambers, including a fairly complete discussion of the Geiger–Muller counter Most of the remainder is devoted to scintillation counters of all kinds, including a useful discussion of photo-multiplier types Chapters on spark counters and crystal counters are also included Unfortunately, the latter does not include semiconductor-junction counters Over the past year these have proved to be an exciting new development of the greatest importance Aside from this omission references are given very fully up to June 1958 The greater part of this volume should not go out of date too fast and will prove to be an invaluable handbook especially for the graduate student in nuclear physics

E B PAUL

IONIC PARTITION AND FINE STRUCTURE IN MUSCLE

By Dr. SHIRLEY E SIMON

Department of Pharmacology, University of Melbourne

THE necessity for reconciling the highly developed structural organization of muscle with existing concepts of ionic accumulation, and the nature of the bioelectric potential, has been stressed in several recent papers[1–4] The idea of the cell as a simple osmometer, in which a moderately distensible membrane separates two more or less equally randomized aqueous phases, would seem inadequate in the light of our knowledge of the detailed morphology of the system[5,6] It is well recognized[7] that there is a gap between our knowledge of the ultra-structure of the system and the physiological function, and it would seem that an attempt to integrate the information obtainable from divergent fields of study should be fruitful

A notable advance of this nature has been made by Porter and Pallade[6], who have suggested that the sarcoplasmic reticulum may be concerned in the intracellular transmission of the action potential, and thus provide the morphological link between conduction and contraction This hypothesis was based on their own observations of the fine structure of the reticulum, and on the work of Huxley and Taylor[5,8,9] These latter authors were able to demonstrate that the local depolarization of the membrane by means of a micro-pipette led to contraction of the adjacent myofibril only if the pipette was placed opposite the *I*-band

A full discussion of the function of the 'endo-membranes' of the cell has been given by Ruska *et al* [2], both from the point of view of the intracellular transmission of the membrane potential, and as phase boundaries which separate the various compartments of the cell These authors also list the relevant bibliography

Ruska *et al* have been concerned chiefly with the electrical inhomogeneities of the system They have inferred an ionic inhomogeneity chiefly from the electrical evidence It would seem, however, that evidence for intense ionic gradients within the cell can be deduced from other observations, and can therefore be considered to support the electrical findings.

The Three-phase Theory

Work carried out in this laboratory has led to the formulation of a three-phase theory to account for the ionic discrimination shown by muscle The evidence for this theory has been detailed in several publications[3,4,10], and it will suffice here to note the main points whereby this model differs from the classical concept of a membrane-mediated discrimination The three phases postulated are the extracellular phase, the free intracellular phase and the ordered phase It is assumed that those ions which are accumulated by the cell are adsorbed by the ultra-structure of the ordered phase, which is envisaged as a highly ordered macromolecular gel extending throughout the greater part of the cell Other ions of the external medium will be excluded from this region of the cell and will be confined to the free intracellular phase This exclusion of certain ions from the greater part of the cell will result in an apparent concentration gradient for these ions across the cell membrane It has been a prime thesis that these 'free intracellular phase' ions should be in a diffusion equilibrium with the external environment, that is, the maintenance of the apparent concentration gradient across the cell membrane results from their partial or complete exclusion from the ordered phase, rather than from the active extrusion of the ions by a pump mechanism It is clear that such a system obviates the necessity for the continuous feeding in of metabolically derived energy in order to maintain the cell in the resting condition

Evidence for the Three-phase Theory

We have studied the partition of a large number of ions across the membrane, and find that they may be roughly divided into two groups those which are accumulated in the ordered phase, and those which are at least partially excluded from it The accumulated ions are potassium, magnesium, calcium and inorganic phosphate Rubidium and cæsium may to some extent substitute for potassium Sodium and chloride are considered to be largely excluded Lithium has been found to behave similarly to sodium , and bromide, iodide and sulphate ions may be regarded as chloride substitutes

The distribution of these ions has been studied both at the steady state and with kinetic methods The results obtained at the steady state have enabled an estimate to be made of the amount of muscle water available in the ion in question, and have also shown the effect of the ion on the normal ionic constituents of the cell The kinetic experiments have enabled us to estimate the rate of movement of the ions into and out of the cell and to determine the effect of changes in environment on these rates[4,10]

The information obtained at the steady state indicates that, as a first approximation, the same amount of muscle water is available to chloride, iodide, bromide and sulphate ion[4,10] The value found for the lithium space is less than for sodium after soaking for 4 hr , and resembles the anion space It was found, however[4], that the lithium space tended to increase with increased time of soaking in the lithium Ringer solution, until at 18 hr it equalled and occasionally exceeded the sodium space This was cited as provisional evidence for the binding of part of the cellular sodium Some type of competition between sodium and lithium for the binding site was envisaged

We have shown previously[3] that when a muscle is equilibrated in normal Ringer solution and then transferred to a solution in which half the sodium chloride is replaced with sucrose, there is a net movement of sodium chloride out of the cell against the concentration gradient. This net movement of sodium chloride is not accompanied by any movement of potassium, nor is it dependent upon the presence of potassium in the external medium. These experiments were repeated with Ringer solution in which all the chloride was substituted with iodide or bromide, and an analogous outward movement of these ions was demonstrated. When, however, this experiment was repeated with lithium, we were unable to show a significant decrease in intracellular lithium when the muscles were transferred to a lower level of external lithium. This and kinetic evidence (Fig. 1) led us to believe that lithium is bound in the cell in a similar fashion, but to a greater extent, than sodium. The failure of lithium to leave the cell in this experiment would then result from the shape of the adsorption isotherm.

It is considered that this adsorption takes place in the free intracellular phase[4], and we must therefore revise our original postulate that ions in this phase are in a diffusion equilibrium with the external medium. This would appear to be true for the anions we have studied, but it would seem that there is some cation-binding in this phase.

The discussion has so far been restricted to the partition of 'excluded' ions between the cell and the external medium. If it is assumed that ions which are accumulated in the ordered phase are in such a condition that the adsorption sites approach saturation, then increases in the external level of the ion in question should result only in increases in the level of the free phase of the ion. Consequently, the ratio of external level to increase in internal level should approximate the ratio out/in for an excluded ion. It may be seen from Table 1 that such an approximation does hold true.

Table 1. COMPARISON OF THE RATIO OF EXTERNAL CONCENTRATION TO INTERNAL CONCENTRATION FOR VARIOUS IONS

Excluded Ions		Accumulated Ions	
	Ratio out/in		Ration out/increase in internal level
Sodium	4.5	Calcium	2.3
Lithium	6.7	Magnesium	6.7
Chloride	5.4	Phosphate	3.6
Iodide	7.4		
Sulphate	7.1		

Each figure is the mean of 12–40 observations. The muscles used were the sartorius muscle of the toad *Bufo marinus*, which were immersed in the appropriate solution for 4 hr.

Definition of Phases

The extracellular phase has been defined as that amount of the muscle water which is available for the free diffusion of inulin or albumin labelled with iodide-131 (ref. 11), and is presumed to coincide morphologically with the region outside the cell membrane.

The free intracellular phase has been defined as an intracellular region intermediate in order between the extracellular phase and the ordered phase. It may be regarded as an intracellular extension of the external phase, but we have never envisaged it as merely an annular region beneath the cell membrane[3,4]. It would seem probable that we can identify this phase with the sarcoplasmic reticulum[6]. This complex tridimensional lattice is a membrane system separating two distinct intracellular phases, which is continuous both with the plasma membrane and the peri-nuclear cysternæ. The electron microscope has revealed no fine structure within the tubules of the reticulum, but the limiting membrane seems to be

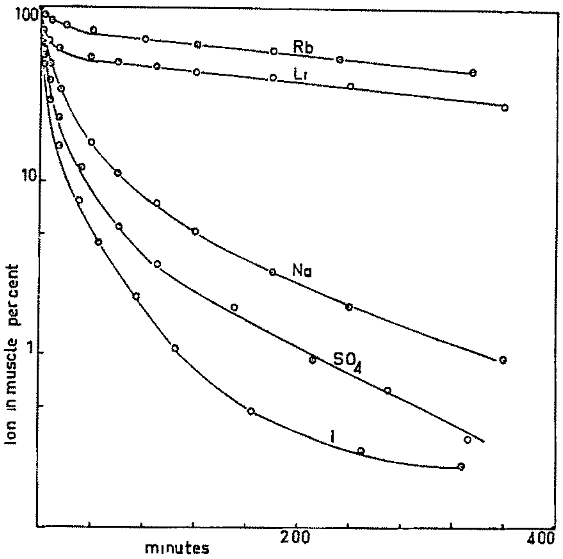

Fig. 1. Efflux of various ions from muscle. All muscles were loaded in the appropriate solutions for 18 hr., then effluxed into Ringer solution. The amount of the ion remaining in the muscle has been plotted as a percentage of that originally present. Lithium and rubidium were estimated photometrically. The effluxes of sodium, sulphate and iodide were followed with isotopes

similar in thickness to the plasma membrane. This phase appears to have a lower concentration of protein than the surrounding cytoplasm[2], and it is likely that this region is more randomized than the matrix.

The ordered phase is defined as that part of the cell which by virtue of its ordered macromolecular structure is able either to accumulate or exclude the ions of the external environment. This region is likely to be morphologically heterogeneous, and will include the contractile mechanism, mitochondria, nuclei, etc.

Intracellular Active Transport

From the point of view of the three-phase theory, it might be supposed that the limiting membrane of the sarcoplasmic reticulum could actively transport ions in the same way as has been postulated for the plasma membrane. Thus this membrane, which is presumed to be located at the boundary of the free and ordered phases, could constitute not only an inner barrier to diffusion but could also play a part in ionic discrimination. It has been suggested, in fact[12], that parts of the plasma membrane may migrate into the cell to participate in the formation of the endoplasmic reticulum, and the reticular membrane could therefore be expected to have permeability properties similar to those of the plasma membrane. It has been calculated that the surface ratio of plasma membrane to reticular membrane in muscle fibres is at least four times greater for the reticular membrane[2]. One must therefore suppose it to be highly impermeable to the ions bathing either face, or the work of active transport necessary to separate the ions would be enormous.

The most serious criticism that can be levelled at the active transport theory must remain that it places great demands on the energy-producing systems of the cell. If it could be shown that the energy required to transport the various ions exceeded that obtainable from resting metabolism, then this would constitute a definite refutation. There have been numerous attempts to compute the energy requirements of the sodium pump, and almost as many different estimates have been obtained[13].

To date, no author has succeeded in comparing with sufficient accuracy the rate of movement of the transported ion with the amount of substrate consumed at the same time[14,15]. A further difficulty resides in the fact that one may question the validity of the computations which have led to estimates of the rate of movement of the ions across the cell membranes.

Analysis of Kinetic Data

It has generally been assumed that the membrane constitutes the principal rate-limiting step to the efflux of labelled ions from the cell, and that movement through the cytoplasm may be regarded as fast compared with movement across the membrane. Thus the system is considered to be effectively stirred, and one would expect to obtain an efflux curve which could be divided into an intra- and extra-cellular portion on the basis of a double exponential loss. The postulate of a uniform intracellular ionic distribution would appear to be unjustified in most cells, and Wilde[16] has called for a more realistic approach. Shanes[17] has mentioned the possibility of sequestering of ions in the organelles, and Harris[18] has attempted to analyse his kinetic data as a function of diffusion through a cylinder with a resistive coating. One still, however, finds the belief[19] that the trans-membrane step can be expressed as a single exponential function.

Experiments which have been carried out in this laboratory have shown that the movement of various ions out of the cell may yield efflux curves of widely differing form (Fig. 1). It would seem unlikely that these vastly differing curves could arise from a similar mechanism of transport across the membrane. It may be noted that lithium and rubidium show similarly shaped effluxes. Since lithium is considered an 'excluded' ion, and rubidium is an 'accumulated' ion, the effluxes cannot be divided into two groups, on the basis of whether their exit or entry is the active or energy-requiring movement.

In all these effluxes we have been concerned with estimating that proportion of the efflux which is due to extracellular material, and what may be considered to be unequivocally intracellular. The only curves in Fig. 1 which approximate to the double exponential loss expected from the membrane theory are the lithium and rubidium effluxes. Since these ions can be followed in their movement out of the cell photometrically, it was possible to estimate the extracellular space with albumin labelled with iodide-131 in the same muscle[11]. The amount of lithium or rubidium in the fast fraction of the efflux was determined by the straight-line extrapolation of the slow fraction back to the concentration axis, and the subtraction of this quantity from the total. The 'apparent' extracellular space for the ion was calculated by dividing this quantity by the external concentration of the ion, and this space was compared with the albumin space in the same muscle. The extracellular space calculated from the efflux curve exceeded in every instance the albumin space. The fast fraction of the lithium efflux gave an apparent extracellular space which was approximately 50 per cent greater than the albumin space, but there was no correlation between the two quantities. The amount of rubidium in the fast fraction of the efflux was also too great to be considered purely extracellular. The apparent extracellular space for rubidium calculated from the efflux observations could be linearly related to the total rubidium-level of the muscle, and the correlation was significant at the 0·1 per cent level.

From information such as this, it has been postulated that there is a fast- and a slow-moving intracellular fraction of these ions, and consequently the main rate-limiting step cannot be considered to be operative at the membrane. In the case of rubidium, it would seem likely that there is an equilibrium between the amount of material in the two intracellular fractions.

The efflux curves obtained with iodide and sulphate ions differ from the rubidium and lithium curves in that there is no well-defined rate-limiting step, and the efflux must be considered to be governed by diffusion rather than a membrane. The amount of intracellular material in these effluxes was determined by following the loss of the tracer from the muscle until the amount remaining approached background, and then transferring the tissue to albumin labelled with iodide-131. It was found in each instance that approximately one-third of the activity lost from the muscle as inorganic iodide-131 or sulphate-35 was intracellular in origin. Inspection of Fig. 1 will show that the movement of these ions across the membrane must consequently be very fast. Harris[20] has also noted that chloride crosses the membrane with great facility.

The efflux of sodium from the cell can be described as being composed of three major exponential terms. It would appear essential that the efflux be followed for long enough for these terms to be fully revealed. It will be obvious from Fig. 1 that effluxes which are terminated after 40–120 min. may be described as the sum of two exponentials, which cannot be related with likelihood of success to any cellular compartment. Further, failure to take into account the later fraction will alter the rate constants of the early components[4].

An attempt was made to establish which (if any) of the three exponential terms of the sodium efflux could be equated with extracellular material. This was done by comparing the amount of material in the various components with the extracellular space as determined with inulin in the companion muscle[11]. It would seem that, as a first approximation, the fastest of the three terms could be due to extracellularly derived material. Thus, amphibian muscle must be considered to contain a fast- and a slow-moving intracellular fraction of sodium, as well as of rubidium and lithium.

It follows from this discussion that (*a*) movement of ions across the membrane appears to be more rapid than was previously thought likely; (*b*) since the principal rate-limiting step is not operative at the membrane there may be considerable difficulty in determining the time constant of the energy-requiring step. Thus on our present information attempts to equate the energy-requirements of active transport with the resting metabolism would seem to be hazardous.

Kinetic Evidence for Intracellular Compartments

In any discussion of the structural organization of the living cell, one must bear in mind the extreme lability of the system being studied. It is well recognized that all histological procedures will give a static picture of a dynamic situation, even allowing for the minimum amount of distortion in the preparative procedures It is perhaps not so obvious that kinetic studies may be equally misleading It is a simple matter to obtain the rate constants of the various components for any efflux curve which may reasonably be described as the sum of two or three exponentials One becomes less confident when attempting to identify the amounts of material in any component with the morphological compartments of the cell As was mentioned above, this type of analysis assumes that the material in the various compartments is effectively stirred, or that movement through the compartment is fast compared with the rate of transfer across the limiting membrane

Berman and Schoenfeld[21] have discussed the validity of the 'compartmental approach', and stress that a compartment must be considered an average rather than an exact state Any experimental system must be considered as a closed box , we do not know what is in the box , but it must preserve a certain input–output relation for the type of experiment performed If this relation is such that it can be analysed mathematically as the sum of n distinct compartments, then it can be defined as such , but this definition need not correspond to the true configuration of the system

Thus, with available techniques, much of our discussion of the localization of intracellular functions must be speculative Information derived from kinetic studies alone will not suffice for us to decide whether intracellular sodium is indeed located in the sarcoplasmic reticulum

Physico-Chemical Considerations

The postulate of a three-compartment system for muscle has been based on evidence derived from a study of the distribution of a number of inorganic ions between the external medium and the cell. No attempt has been made to describe the mechanism whereby the ordered phase can accumulate or exclude the various ionic species It is possible that our knowledge of complex ion–protein systems is still too tentative to permit of an understanding of the process of ionic discrimination There are, however, certain physico-chemical considerations which must apply at the cellular level, whether we are concerned with the membrane-based discrimination or a cytoplasmic discrimination

Ling[22] has made an attempt to relate ionic differentiation to fundamental concepts, and has been criticized because his theories appear incomplete Conway[13] has referred to the theoretical fallacy in Ling's central idea, which in his opinion lies in Ling's assumption that the hydrated potassium, because of its smaller size, can enter farther than the hydrated sodium into a zone of reduced dielectric constant around the fixed anionic site It would appear that both these authors have used an over-simplified approach to the problem of cation – macromolecular interactions, and in particular it should be pointed out that the degree of hydration of a cation varies with the dielectric constant of the medium The fixation of cations on the ionized groups of water-soluble macromolecules has been discussed in a comprehensive treatise by Bungenberg de Jong[23] The relative affinity of any cation and the fixed anionic site must depend upon the valency, radius and polarizing power of the cation, and on the polarizability of the negatively charged group of the colloid Since the phenomenon of cation fixation occurs in an aqueous medium, the polarizability of the water itself must play a part Whether the polarizability of the fixed group is more or less than water is of great importance in determining the affinity of the cation for the site The characteristically opposite behaviour of phosphate and sulphate colloids in cation fixation can be explained from the different polarizabilities of the ionized groups, phosphate being more strongly polarizable and sulphate less polarizable than water This will result in an affinity order for cation fixation by sulphate colloids of potassium > sodium > lithium, whereas in phosphate colloids this order will be reversed lithium > sodium > potassium

In this respect it is of interest to note that Kirschner[24] has demonstrated sodium-binding by phospholipides from pig erythrocytes

At least one of the complicating factors in transferring this type of colloid chemistry to living systems would be that the polarizability of the fixed anionic groups would be altered by adjacent polar groups in the macromolecule, which could be expected to undergo change at different times in the metabolic cycle

Ultra-structure studies have indicated the presence in the cell of an ordered array of macromolecules[25] It would seem that a necessary concomitant of such a definite molecular pattern must be that the cell contains a differential distribution of inorganic ions

In considering the nature of the interaction between sodium and potassium and the binding site, whether the site be considered cytoplasmic or a membrane carrier, most authors have considered the hydrated radius to be the operative dimension[22,26,27] An exception is provided by Solomon[28], who was able to relate his results for the movement of monovalent cations into the red blood cell better with the naked than with the hydrated radius

However, the degree of hydration of the cation is merely a reflexion of its polarizing characteristics If the ion finds itself in the vicinity of a group which is considerably more polarizable than water, for example, the phosphate group of lecithin, it will shed its water of hydration because a much larger polarization energy is set free on the attachment of the anhydrous ion to the phosphate group From considerations such as these, Bungenberg de Jong[23] has suggested that all variants of the type colloid anion + micro-cation involve this very close approach between the charged groups However, these direct contacts are not to be thought of as static, and therefore permanent They will be dynamic and of short duration, so that over a period of time the contact will be broken, and fresh contacts made

It is clear from this discussion that even in the absence of the biological turnover of a binding site due to metabolic breakdown and re-synthesis, one could expect a considerable exchange between (say) bound potassium and potassium-42 added to the external environment

Complex Coacervation in Biological Systems

A phase separation may occur when two oppositely charged polymers are mixed together The resulting system has been termed a coacervate, from the Latin *acervus*, a heap The two-phase system will consist of one phase which contains the greater amount of the two polymers, and another which contains a small amount of one or both of the polymers, and a large amount of the dispersion medium If the system also contains an appreciable amount of micro-ions, these will be distributed between the two phases in a manner characteristic for the system under consideration

Overbeek and Voorn[29] have emphasized the importance of this type of concept in our approach to the physical chemistry of cytoplasm, and Troshin[30] has based his theory of ionic discrimination on this type of consideration The coacervates as described by the Dutch workers behave as regards their viscosity like Newtonian liquids Thus, the association of macromolecules in the coacervate may be regarded as dynamic, there being both intra- and intermolecular points of contact of the statistically kinked macromolecules

One should differentiate sharply between the type of coacervate obtained by the association of a linear polymer, and the colloid-rich phase which may be obtained with corpuscular proteins When this latter type of protein is obtained in the low-dispersed form, one usually obtained colloid crystals, rather than liquid coacervates The colloid crystals will owe their stability to the presence of lateral bonds between groups of contiguous folds of the macromolecule, or between sub-units, which will counteract the tendency of the macromolecule to form the most probable shape, that of the statistically kinked macromolecule

Such a description would seem to fit in very well with the physical chemistry of such high molecular weight compounds as the deoxyribonucleic acids[31] It may be suggested that the ordered phase (or at least the organelles) conforms to this type of macromolecular pattern more than to the random liquid system of complex coacervation

The ability of the ordered phase to exclude an ion by some mechanism other than membrane impermeability may be questioned It would seem improbable that cytoplasm, which consists of 80 per cent water, would contain a sufficiently large amount of water in the 'bound' state to explain the exclusion of sodium If, however, the cell is considered as a system of modified complex coacervates, then the partition of salts between the two partially immiscible phases would be entirely different from that obtaining in the test-tube The ordered phase, therefore, will be a colloid-rich phase in which there is a high degree of molecular orientation and structural differentiation The free intracellular phase, which we tentatively identify with the sarcoplasmic reticulum, will conform more to the labile, short-term pattern which is typical of coacervates

SCIENTISTS AND ENGINEERS IN BRITAIN[*]

THE second report on scientific and engineering man-power from the Committee on Scientific Man-power of the Advisory Council on Scientific Policy compares the situation in Great Britain in 1959 with that in 1956 and estimates the developments likely by 1962 Like the first report, it is based on information collected by the Ministry of Labour and National Service, this time in the first three months of 1959, covering private industry, the nationalized industries and public corporations, central and local government (excluding education and the Armed Forces) and education, but agriculture is again excluded as well as self-employed persons, persons employed by firms of consultants, and scientists and engineers working outside Great Britain The inquiry is slightly more comprehensive than that in 1956, which excluded firms employing less than 100 workers, for it covers, besides all establishments employing 500 workers or more, a sample of those with 11–499 workers (31–499 workers in the building and contracting industry) It is estimated that the employments covered account for nearly 90 per cent of all qualified scientists and engineers in Great Britain As in the previous report, these terms are applied to persons with one of the following qualifications a university degree in science or engineering , the diploma in technology , an associateship of one of the higher educational institutions , graduate or corporate membership of one of the professional institutions Technologists with specialist qualifications in branches of applied science such as textiles, rubber and plastics are again excluded, unless they qualify as defined above

For early 1959 the report gives the total of qualified scientists as 63,200 and of engineers as 89,200 , 43,600 of the grand total possessed the higher national certificate or diploma of technology only Of the scientists, 21,200 are employed in manufacturing industry, 1,000 in industrial research associations, 3,200 in nationalized industries, 6,400 in central government and 28,700 in education , 2,000 are employed in other manufacturing industry and 400 others in teaching. For engineers the corresponding figures are 42,400, 600, 17,000, 8,500, 3,300, 4,900, and 1,300, 4,100 qualified engineers are employed in the building and contracting industry and 6,600 by local authorities. It is estimated that 5,000 scientists and 9,600 engineers are in employment not covered by the inquiry, and 4,000 and 2,000 respectively in postgraduate research. The grand total of 173,000 represents an increase of 19·3 per cent over the 1956 figures and an increase from 6 to 7 in the number of scientists and engineers per thousand of the working population, apart from the 43,000 possessing no higher qualification than a higher national diploma or certificate.

---

[*] Scientific and Engineering Manpower in Great Britain 1959 Pp vi+48 (Cmnd 902)(London H M Stationery Office, 1959)3s net

Of this increase, 62 per cent has gone into private manufacturing industry, 13 per cent to nationalized industry, 17 per cent to education, and 8 per cent to central and local government, more than half the increase in the nationalized industries and public corporations being attributable to the Atomic Energy Authority, where the increase was 71 per cent (2,470 to 4,220), and a further increase of 42 per cent by 1962 is anticipated. Taking scientists and engineers separately, manufacturing industry has gained 53 per cent of the scientists and 69 per cent of the engineers, for nationalized industry the figures are 8 per cent and 16 per cent, respectively, for central and local government, 6 per cent and 3 per cent; and for education, 32 per cent and 6 per cent, respectively. The actual increase of 19·7 per cent or 23,600 compares with the employers' forecast of 32,500 or 27·2 per cent, for manufacturing industry the actual increase was 30·2 per cent, for research associations, 10 per cent, for nationalized industry, 18·4 per cent, for central government, 7·5 per cent, local government, 3·8 per cent, and education, 14 per cent.

Nearly 70 per cent of the net gain for manufacturing industry in scientists and engineers is concentrated in electrical engineering, chemicals and allied trades, other plant and machinery and aircraft. As regards private manufacturing industry as a whole, the proportion of qualified scientists and engineers to the total number of persons employed rose from 8 to 11 per thousand. In most industries the percentage engaged on research and development showed little change compared with 1956. In the shipbuilding, ship-repairing and marine engineering group it increased from 9 to 20 per cent, and in the railway equipment industry from 5 to 23 per cent, but in the aircraft industry there was a substantial increase in the proportion of scientists and engineers engaged on work other than research and development. In manufacturing industry as a whole, 41·2 per cent of scientists and engineers were engaged on research and development compared with 44·5 per cent in 1956, in electronics the figure was 66 per cent, for precision instruments, 60 per cent, for aircraft, 54 per cent, for heavy electrical engineering, 53 per cent, and man-made fibres, 51 per cent. Establishments with staffs of 500 or more employed 69 per cent of the scientists and engineers in this sector, but only 46 per cent of all persons engaged in manufacturing industry, for scientists the figure is 64 per cent, and for engineers 71 per cent, and 68 per cent of these scientists and 80 per cent of the engineers were engaged on research and development. For establishments employing more than 100 workers a proportionately smaller increase in the number of engineers and scientists employed was expected during the next three years compared with 1956–59.

The industrial research associations which in 1956 employed nearly 1,400 scientists and engineers hope to employ 1,800 by 1962—an increase of 17 per cent in the next three years, whereas the nationalized industries hope to employ 24,900, an increase of 20 per cent on the 20,700 employed in 1959, and of 18 per cent on 1956. For the Gas Council and the Area Gas Boards, the increase was 17 per cent, for the National Coal Board, 15 per cent, and for the Electricity Authorities, 2·5 per cent; but the latter employed an appreciably higher proportion of qualified scientists and engineers (30 per thousand) than the average for manufacturing industry or for the other public corporations except the Atomic Energy Authority (123 per thousand). Whereas for all other public corporations only 8 per cent of scientists and engineers on average were employed on research and development, for the Atomic Energy Authority the figure was 63 per cent, and for the Airways Corporation 33 per cent. By 1962 the Electricity Authorities look for a further increase of 35 per cent in the number of scientists and engineers, and the British Transport Commission for a 29 per cent increase.

Whereas in 1956 the departments of central government expected to increase their total of scientists and engineers from 13,800 to 15,800 by 1959, the increase was only 7·5 per cent, mainly because the expected 11 per cent increase in the defence departments did not occur, the number employed remaining at 7,600. It is estimated that about 20,000 scientists and engineers, including those serving in the Armed Forces, were employed on defence work at the beginning of 1959, about half of whom were engaged on research and development, and accounting for about 25 per cent of all scientists and engineers engaged on research and development in industry and government research establishments compared with 40 per cent three years ago. The fall in the proportion in the aircraft industry engaged on research and the smallness of the increase in qualified personnel in the electrical engineering industry may be due to cuts in defence contracts.

The civil departments employ nearly 4,600 scientists and engineers, or about 30 per cent of the total employed by the central government. An increase from 2,350 to 2,700 in the number employed by the research councils between 1956 and 1959 reflects principally the planned expansion in the Department of Scientific and Industrial Research under the five-year plan initiated in 1954, and the 12 per cent increase forecast by the civil departments by 1963 includes a 16 per cent increase for the research departments, covering provision for the second five-year plan for the Department of Scientific and Industrial Research, which calls for a 6 per cent a year increase in its professionally qualified staff. In the same period, the defence departments anticipate a reduction in the total number of scientists and engineers to 7,450 as the net result of a 6 per cent increase in scientists and a 6 per cent decrease in engineers.

Of the 6,700 scientists and engineers employed by local authorities in 1956, about 80 per cent were civil and structural engineers. In 1959 the total was more than 6,950, but 1,150 immediate vacancies are reported and an increase of 25 per cent is hoped for by 1962. The increase among civil and structural engineers in 1959 was 11 per cent, but the number of mechanical engineers fell from 660 to 370.

The current scientific man-power position in education is discussed elsewhere (see p. 1971 of this issue), and apart from noting that some universities consider that their competitive position has improved in the past two years, it should suffice here to refer to the forecasts of requirements for teachers from 1959 until 1962 given in the report. For the universities an increase of 1,275, or 30 per cent, to 5,450 is forecast; for technical and teacher training colleges the corresponding figures are 1,620 (24 per cent) and 8,480; and for the schools 3,675 (16 per cent) and 26,290. The forecast of requirements for university teachers by 1962 assumes that two-thirds of the increased numbers of students reaching the universities by 1962 will read pure science or technology. It is also expected that by 1962 about 5,000 scientists and 2,500 engineers will be engaged on postgraduate work in the universities, compared with 4,000 and 2,000, respectively, in 1959.

The net increase in the forecast of requirements for technical colleges, teacher training colleges and schools includes about 1,000 current vacancies, nearly half of which are in Scotland, and it is admitted that the figure for England and Wales greatly underestimates the number of additional teachers needed to restore 1953 staffing standards. To reduce the size of swollen classes might require a further 4,000–5,000 science teachers.

The figures for various categories of scientists employed in 1959 (with the percentage increase on 1956 in brackets) are as follow: 6,400 biologists (25·5), 24,300 chemists (16·3), 800 geologists (−11·1), 13,000 mathematicians (12·1), 13,600 physicists (28·3) and 2,700 other scientists (28·6). For engineers the figures are: metallurgists, 3,600 (12·5); chemical engineers, 1,900 (26·7); civil engineers, 13,700 (7·0); electrical engineers, 20,000 (12·4); mining engineers, 4,600 (21·1); mechanical engineers, 34,000 (25·9); engineers in teaching, 3,300 (37·5). The following figures give the forecast of additional numbers required by 1962 (percentage increase on 1959 in brackets): biologists, 1,200 (17·6); chemists, 5,400 (20·5); geologists, 200 (25·0); mathematicians, 2,700 (19·6); physicists, 3,300 (20·2); other scientists, 200 (16·7); metallurgists, 1,300 (35·1); chemical engineers, 700 (35·0); civil and structural engineers, 3,300 (22·9); electrical engineers, 6,000 (27·9); mining engineers, 200 (4·3); mechanical and other engineers, 8,700 (23·8); engineers in teaching, 1,200 (26·1). The figures take no account of the demands abroad for scientists and engineers trained in Great Britain.

For 1962 a grand total of 87,100 scientists and 124,600 engineers is forecast by the inquiry, of whom 76,200 scientists and 110,800 engineers are required in fields covered by the inquiry and 5,000 scientists and 2,500 engineers in postgraduate research. Moreover, it is assumed that 6,000 scientists and 8,400 engineers will be needed to replace wastage from death, retirement, etc. Against this, an output of 51,650 scientists and engineers is forecast for the period 1959–62, of whom only about 47,500 will be available for employment in Great Britain compared with anticipated requirements of 53,100. About 60 per cent of the total will be university graduates (28,800), holders of the diploma in technology (900) or associates of one of Scotland's central institutions (750); the remaining 21,200 will be admitted to professional institutions on the evidence of other qualifications. By 1962 the annual output is expected to reach about 19,000 compared with 15,000 in 1958, and of the net 47,500 available for employment in Britain, 19,200 will be scientists and 28,300 engineers. Of the 5,674 scientists qualifying for the first time in 1958, 494 did so in biological sciences, 1,296 in chemistry, 167 in geology, 496 in mathematics, 755 in physics, 599 in general science, and 1,357 by pass degrees. Of the 9,326 engineers, 333 qualified in aeronautical, 325 in chemical, 1,047 in civil and structural, 1,658 in electrical, 734 in marine, 2,748 in mechanical, 504 in mining and metallurgy, 432 in production, 225 in municipal, 146 in naval architecture, and 1,087 in general engineering, etc.

NEWS and VIEWS

Australian Commonwealth Scientific and Industrial Research Organization Executive

THE appointment has been announced of two new members to the Executive of the Australian Commonwealth Scientific and Industrial Research Organization. This follows the passing last month of an amendment to the Science and Industry Research Act, enlarging the Organization's Executive. The new full-time members will be Mr. C. S. Christian, chief of the Organization's Division of Land Research and Regional Survey, and Prof. L. G. H. Huxley, Elder professor of physics in the University of Adelaide.

Mr. C. S. Christian

MR. CHRISTIAN has been associated with the Commonwealth Scientific and Industrial Research Organization ever since his graduation from Gatton College and the University of Queensland. In 1931 he studied genetics at the University of Minnesota, and in 1933 he held an appointment under Sir Ronald Fisher at Rothamsted Experimental Station. On his return to Australia, he undertook wheat and plant breeding research with the Commonwealth Scientific and Industrial Research Organization in Canberra and in Queensland. In 1946, following a request from the North Australian Development Committee, Mr. Christian organized the North Australia Regional Survey, which has since become the Commonwealth Scientific and Industrial Research Organization's Division of Land Research and Regional Survey. In 1955, Mr. Christian was invited by Unesco to advise in Syria on the establishment of a resources survey unit, and similarly in 1958 he went to India to plan a Central Arid Zone Research Unit. He is the Australian delegate to the International Rice Commission and president of Section K (Agriculture) of the Australian and New Zealand Association for the Advancement of Science. He has been president of the Queensland and A.C.T. branches of the Australian Institute of Agricultural Science.

Prof. L. G. H. Huxley

PROF. HUXLEY was educated at Hutchins School in Hobart, and at the University of Tasmania. He was the Tasmanian Rhodes Scholar in 1923, and went to New College, Oxford, in 1925, to read honours physics. He was awarded his doctorate in 1928, and returned to Australia in 1929, to carry out research for the Radio Research Board, under Sir John Madsen. He returned to England in 1931 and became in succession lecturer in physics at Nottingham, Leicester and Birmingham. During the War he was in charge of a radar school under the Ministry of Aircraft Production. Prof. Huxley returned to Australia ten years ago to take the chair of physics at the University of Adelaide. He is a member of the Councils of the Australian National University and the University of Adelaide. He has been associated with the Commonwealth Scientific and Industrial Research Organization through his chairmanship of the National Standards Commission and the Radio Research Board. He was a Foundation Fellow of the Australian Academy of Science, and is now the Academy's secretary (physical sciences). He is keenly interested in educational matters, being chairman of his University's Education Committee, and patron of the Science Teachers Association of South Australia.

Mr. G. B. Gresford

Two changes are also announced in the top administration of the Commonwealth Scientific and Industrial Research Organization. Mr. Guy B. Gresford has been appointed secretary and Mr. Walter Ives, executive officer. Mr. Gresford was educated at Trinity College, University of Melbourne. He joined the Organization in 1942. During the period 1943–46 he was in England on the staff of the Australian Scientific Liaison Office in London. He became assistant secretary of the Commonwealth Scientific and Industrial Research Organization in 1946 and research secretary (physical sciences) in 1952. In 1957, Mr. Gresford went to the United States on a Commonwealth Fund Fellowship, studying at the Harvard School of Public Administration and at the National Science Foundation in Washington.

Mr. W. Ives

MR. IVES graduated in economics at the University of Sydney. During the War he was with the Department of War Organization of Industry, and transferred later to the Department of Postwar Reconstruction. He joined the Commonwealth Scientific and Industrial Research Organization in 1946 as technical secretary of the Division of Plant Industry. He became assistant secretary of the Organization in 1950 and research secretary (biological sciences) in 1952. During 1954–56 he was chief scientific liaison officer at the Australian Scientific Liaison Office in London.

British Antarctic Party

THE third party of scientists and technicians of the Falkland Islands Dependencies Survey left Southampton on December 18 for the Antarctic aboard the Danish polar-exploration vessel, M.V. *Kista Dan*. Sir Vivian Fuchs, director of the Survey, flies from London on January 4 and joins the *Kista Dan* at Montevideo, where the vessel will take aboard two aircraft. These will be assembled at the ice edge to help in re-opening the Survey's southernmost base on Stonington Island (closed in March this year because of difficult ice conditions). Sir Vivian will take personal charge of this and allied operations and expects to be in the Antarctic for the rest of the summer season. The aircraft that will be used by the Falkland Islands Dependencies Survey will also support British exploration teams travelling south of Marguerite Bay. They will be operated by a Royal Air Force team of five. The Falkland Islands Dependencies Survey has maintained bases on the coast of Graham Land and nearby islands for fifteen years. At the bases, between 80 and 90 scientists and technicians spend periods of up to two years carrying out a regular programme of surveys, research and meteorological work. In January this year the Survey took over the base at Halley Bay (Coats Land) set up by the Royal Society expedition of 1955 as part of Britain's contribution to the International Geophysical Year, following the British Government's decision that scientific work should be continued there. Every antarctic summer, between November and March, the sea ice clears sufficiently for specially-built vessels to make the difficult voyage to Britain's Antarctic bases with relief staff and supplies. M.V. *Kista Dan* has been chartered by the Falkland Islands Dependencies Survey this season to supplement the work of its own vessels, R.R.S.'s *John Biscoe* and *Shackleton*. The former is expected to take part in the re-opening of the base on Stonington Island after she has relieved the Halley Bay base.

Nigerian College of Arts, Science and Technology

MORE than £85,000 was made available for the Nigerian College of Arts Science and Technology among grants and loans approved in November under the Colonial Development and Welfare Acts. Four grants were approved for the building programme of the College—£22,500 for a library and £15,322 for a 30-man hostel at its Zaria branch, and £18,750 for a library and £28,584 for a hostel block and two link blocks to accommodate 54 students at Ibadan. This brings to £1,087,719 the total made available for the development of the College since the first grant was approved in 1950. The College was established by the Nigerian Government as an autonomous federal institution, with branches at Enugu, Ibadan and Zaria, to share with University College, Ibadan, the task of providing higher education in the territory. It trains students in arts and science subjects leading to the United Kingdom General Certificate of Education (Advanced Level) and provides full professional courses leading to the examinations of appropriate professional bodies in Britain or to college diplomas, and certificate and other courses. The College is fully residential and it is hoped that by 1962 it will accommodate up to 1,250 students in its three branches. Total enrolment in the 1958–59 academic year was 875 students.

New Research Laboratories of Messrs. John and E. Sturge

NEW laboratories for organic and biochemical research work have been opened at Wheeleys Road, Birmingham, by John and E. Sturge, Ltd., as part of a plan to centralize the company's research work. One of the main activities will be fundamental research on fermentation problems, particularly in connexion with the microbiological production of citric acid, involving a close study of the biochemical and chemical aspects of the life-cycle of *Aspergillus niger* and the undertaking of an extensive mutation programme. The laboratories include an instrument room maintained at 20° C., a special cold room for enzyme manipulation in which the temperature can be kept down to 0° C. indefinitely, and sterile air-conditioned rooms to facilitate the handling of micro-organisms. The existing physical chemistry research laboratories at Wheeleys Road have been modernized, and are now fully equipped for radiochemical and high-vacuum work and for ultra-violet spectroscopy. At the company's Lifford Chemical Works, Birmingham, the analytical laboratories are being extended to cope with the testing of increased production, and the development laboratories have been rehoused in larger premises and now include a section for technical service work on rubber, plastics, paper, paint and printing inks. The Yorkshire laboratories at the company's Selby works—formerly devoted to the organic and biochemical research work—are now being used to extend the facilities of the development, analytical and microbiological departments. Construction work will start shortly on a new pilot plant, together with an associated laboratory and administrative offices.

Structure and Age of the Stars

THE improvements in our knowledge of nuclear reactions and of the opacity of stellar material are leading to corresponding advances in our ideas of the structure and ages of the stars. Developments in high-speed computers are playing a major part in this work, as may be seen from two recently published papers. C. B. Haselgrove and F. Hoyle (*Mon. Not. Roy. Astro. Soc.*, 119, 112; 1959) have constructed new models for stars of population types I and II, the latter having one-twentieth of the metal abundance relative to hydrogen that is present in type I. The integrations refer to uniform stars before substantial evolution has taken place. The results show that for stars with central temperatures less than about $2 \cdot 1 \times 10^7$ °K. the proton–proton reaction dominates the energy production; for hotter stars the carbon–nitrogen cycle is dominant. This central temperature is reached in stars of roughly twice the solar mass. Stars which are more massive than this also possess convective cores. An evolutionary run was obtained for a star of solar mass, and the age of the Sun, determined by fitting the observed luminosity, is $5 \cdot 2 \times 10^9$ years, in excellent agreement with the geophysically determined age. It also appears likely that the separation at zero age of the main sequences of the different stellar populations does not exceed 0·1 mag. In a second paper (*Mon. Not. Roy. Astro. Soc.*, 119, 124; 1959) Hoyle re-computes evolutionary sequences for stars corresponding closely to the lower portions of the globular cluster and the *M* 67 cluster giant sequences, that is, for types II and I, respectively. He concludes that both these type of stars must be aged at least 9×10^9 years. If it is assumed that type II stars are older than type I stars, Hoyle shows that the age of the Galaxy must be at least 10^{10} years, and that the cluster cepheid variables cannot be brighter than absolute visual magnitude $+0 \cdot 6$, a result in agreement with recent evidence from other lines of investigation.

Great Indian Rhinoceros

THE Great Indian rhinoceros, *Rhinoceros unicornis*, is one of the mammals the names of which appear on the list of animals in danger of extermination, which is maintained by the Survival Service Commission of the International Union for the Conservation of Nature and Natural Resources. In 1958, about 800 of these rhinoceros were believed to exist, of which some 400 were known to be in India. About the same number were thought to live in Nepal, in the valley of the River Rapti. The number of this rhinoceros in India was fairly accurately known because of the interest of the Indian Government, the attention given to the species by the Indian Board for Wild Life, and especially to the work of E. P. Gee. There were about 350 rhinoceros in sanctuaries in Assam—notably 250 in the Kaziranga Wild Life Sanctuary—and fifty in Bengal. About the number of rhinoceros in Nepal no accurate figures were known. In September 1958 a message from Katmandu came to the International Union for the Conservation of Nature stating that only about thirty-five rhinoceros remained in Nepal; the rest had been killed by poachers. The Survival Service Commission of the Union arranged for Gee to visit Nepal to investigate the distribution and status of rhinoceros in Nepal and to suggest measures for its preservation. A survey by Gee shows that the rhinoceros has not reached the levels which the message from Nepal had described, but the general picture is of declining numbers in a shrinking habitat. Gee's report has been accepted by the Survival Service Commission and given to the Union for appropriate action to preserve the Great Indian rhinoceros (*Oryx*, 5, No. 2; August 1959).

University News: Manchester

DR. F. FAIRBROTHER, reader in inorganic chemistry and assistant director of the chemical laboratories in the Faculty of Science, has been granted the status of professor of inorganic chemistry.

Oxford

THE following grants are announced: from the Nuffield Foundation for two years a sum not exceeding £8,000, for the continuation of research being carried out by H. B. Parry at the Nuffield Institute for Medical Research, under the direction of G. S. Dawes; from the du Pont Company, U.S.A., a grant of 3,000 dollars for the year 1960–61, for the support of basic research in the field of theoretical chemistry in the Institute of Mathematics, under the direction of Prof. C. A. Coulson; and £3,000 spread over three years from B.P. Trading, Ltd., for the purpose of continuing a research fellowship in geochemistry, to be nominated by the professor of geology.

Announcements

DR. EDGAR ZWILLING, professor of biology at Brandeis University, Waltham, Mass., has been appointed to serve a three-year term on the Embryology and Development Training Committee, which is administered by the Division of General Medical Sciences of the National Institutes of Health, U.S. Public Health Service. Dr. Zwilling will review applications for training grants in the basic sciences related to embryology and development, and will also provide technical advice to the National Advisory Health Council of the National Institutes of Health and the Surgeon General of the Public Health Service on matters pertaining to the research training problems of the nation.

ERRATUM. We regret that in the article entitled "Occurrence and Quantitative Determination of 2-Dimethylaminoethanol in Animal Tissue Extracts" in *Nature* of August 15, p. 551, the 17th line from the bottom of the right column should read "migration value where 'cysteine' has " instead of " where 'glycine' has ".

HEATING AND VENTILATION

BRITISH OCCUPATIONAL HYGIENE SOCIETY CONFERENCE

THE eleventh conference of the British Occupational Hygiene Society was held at the Institution of Mechanical Engineers on November 5, the president, Mr W H Walton, occupying the chair Dr T Bedford opened the proceedings with a paper entitled 'Requirements for Satisfactory Heating and Ventilation", in which he discussed the suppression of body odour, the combating of airborne infection, the release of toxic materials in factories and the maintenance of comfort The definition of comfort zones is effected, to a first approximation, by the dry-bulb temperature of the air This, however, could be misleading if radiation, atmospheric humidity and air movement are sufficiently large These were taken account of by the speaker's "corrected effective temperature", though it had to be remembered that individual preference differed, and so, too, did the general attitudes in different seasons and countries To be pleasant as well as comfortable the surrounding atmosphere had to contribute an element of stimulation This was associated in the first place with air-movement, which, while perceptible, was insufficient to constitute a draught The upper desirable limit depended on temperature Very low or very high relative humidities were often objectionable, but the optimum was not sharply defined The method of supplying artificial heat was important in the avoidance of stuffiness Warm walls had been found satisfactory, while the lower part of the body should be warmer than the upper with a gradient of 2° F to 3° F over the height of a standing man Heated ceilings required cautious use, for this reason Experiments with heated floors suggested that discomfort began when the surface exceeded 77° F

The engineering approach to air conditioning was explained by Mr B G Lawrence, of the National College for Heating, Ventilating, Refrigeration and Fan Engineering His paper, which will be of the utmost value to consultants in heating and ventilation, explained in detail the basic methods of heating, cooling and humidifying air and drew comparisons from which it was possible to decide upon the system best suited to a particular application

Work in hot environments was dealt with by Dr A R Lind, of the Medical Research Council Unit, for Research in Climate and Working Efficiency In hot surroundings men rapidly experience discomfort and fatigue, their working capacity falls, errors of perception and judgment appear and, ultimately, serious physiological disturbances are followed by collapse The heat exchange between the body and its surroundings is complicated by a rise in body temperature during work which becomes greater in climates that are too hot An appraisal of the heat stress imposed by given surroundings necessitates an understanding of the way in which the heat exchange will be influenced by the thermoregulatory system of the human body In the absence of such regulation a man hard at work would increase in temperature by 14 4° F an hour In hot surroundings, acclimatization after about two weeks plays an important part in enabling regulation to be extended beyond the normal limit, it is associated with improved circulation, which helps the transfer of heat from deep tissues to the surface of the skin Dr Lind compared various indexes of heat stress and concluded that the predictive value of the sweat-rate system was valid under the widest range of conditions It was of practical value to be able to use an index to define the upper limit of a tolerable thermal environment Work was at present in hand, for example, to determine the safe duration of exposure for personnel engaged in mine-rescue operations Permissible limits for everyday work were important in industrial, mining and Service activities, a comparison of naval and mining proposals was made The final section of the paper dealt with measures which could be taken to relieve heat stress and the probable physiological response to them

Flight Lieut J Billingham (Institute of Aviation Medicine) and Mr D J Day (Royal Aircraft Establishment) discussed cabin air-conditioning in military aircraft, the former covering physiological aspects and the latter engineering The problem of keeping the pilot comfortable presented novel features The air-cooling system had to extract a considerable amount of heat so that the difference in temperature between inlet and exit air might be as high as 50° F, even with a very high rate of air change The difference between wall and air temperature might also be large and in either direction Heat was produced by electronic equipment, but the exposed cabin walls were cold, on the other hand, the development of supersonic aircraft would result in heating of the cabin skin, and solar radiation had the same effect on its upper parts The humidity of air taken in to ventilate high-flying aircraft was practically zero Water could be added in civil machines, but the need to save weight might not permit this in military craft The clothing of air-crews varied a great deal Impermeable pressure suits might suffer from condensation of body moisture upon the inner surfaces and, for this reason alone, all such suits should be ventilated The pilot had to be able to control the air temperature to some extent, depending on his mean radiant temperature and his clothes The degree of variation, and of comfort provided, was a matter of balance between his deterioration in mental performance and the increase in the performance of the aircraft resulting from saving of weight A more severe stress could be imposed on a man embarking on a short sortie than would be tolerated during a long expedition

Mr Day directed attention to the properties of the I C A N standard atmosphere, which was the raw material for calculations on air supplies Real conditions often departed from this ideal specification In aircraft powered by gas turbines, a bleed from the compressor pressurized the cabin This air required to be cooled, its volume was decided by the heat load and the leakage rate Enemy action had to be considered in military planes and an excess of 4 lb /in ^{2} was not exceeded Up to 9 lb /in ^{2} was acceptable in civil machines, giving a cabin altitude of 8,000 ft at a true height of 47,000 ft Under the skin of the cabin, thermal insulation was provided by up to 1 in of superfine fibreglass Uniformity of temperature was achieved by careful arrangement of the air inlets. About 15 lb./min. was a typical figure for the air supply to a single-seat cockpit. Primary air cooling was performed by an air-to-air ram-operated exchanger. The heat picked up could not be rejected into the air stream, so it had to be used up by evaporating water or by heating up the considerable amount of fuel carried, which might even be refrigerated before loading. The final cooling, before admission to the cabin, was obtained by expansion. Temperature control was by a mixing valve.

The conference was concluded with a paper by Surgeon Commander S. Miles, of the Royal Naval Physiological Laboratory, who said that the nuclear propulsion unit brought with it the possibility that a man might in future spend a full commission beneath the surface of the sea, not necessarily as part of a defence programme, since the cargo-carrying submersible vessel was now the subject of study. The problem to be faced was the confinement of a crew in complete isolation while they worked, played, ate and slept encompassed by the sea. During this time a high standard of health and morale had to be maintained. The cumulative effect of a discharge of toxic agent made the risks abnormal. Carbon monoxide, carbon dioxide, body odours, fumes from cooking, paint, machinery and batteries had to be dealt with. The provision of oxygen from storage cylinders or chemical sources was expensive in space and might be replaced by the electrolysis of sea water or the absorption of dissolved gas, following the plan adopted by fishes. Water was readily obtained by distillation, but food was a problem. Cyclic feeding had been mooted by space-ship planners. The screening of the reactors was efficient and the only source of radiation could be an escape of coolant, which was guarded against by continuous monitoring. Luminous watch and instrument dials were banned. As a voyage progressed there was a swing to classical music in the popular taste, while conversation tended to become deeper. Educational courses were popular and afforded compensation for the long immurement. Exercise remained a difficulty.

The papers presented at this conference and the discussion on them will be printed in Vol. 2, part 3, of the *Annals of Occupational Hygiene*.

C. N. DAVIES

SELECTIVE OXIDATION OF TETRAPYRROLE SIDE-CHAINS

By J. BARRETT and P. CLEZY
Institute of Medical Research, Royal North Shore Hospital of Sydney

IN studies to determine the nature of the side-chains and their relative positions on the nucleus in the tetrapyrroles, porphyrin *a* (ref. 1) and chlorin a_2 (ref. 2), we have made considerable use of selective oxidation methods, some of which are new to this field while others have been further investigated. Since these methods have also been of value in preparing various model compounds they are of general application in this field and this communication summarizes our experience.

Because of evidence that porphyrin *a* and chlorin a_2 (ref. 3) are hydroxylated compounds a method was required which would oxidize the alcohol group to carbonyl and thus demonstrate whether it was conjugated to the ring, but which would not cleave the vinyl or extended vinyl side-chain, known to be present in these tetrapyrroles. Fischer[4] employed potassium dichromate in pyridine to achieve this type of oxidation, but this oxidant in our hands gave poor yields together with degradation products. When acetone or glacial acetic acid was used as solvent, products with oxyporphyrin type spectra rapidly formed. However, oxidation of both primary and secondary hydroxyl groups could be readily effected with the reagent developed by Jones *et al.*[5] for the oxidation of acetylenic carbinols, in which chromium trioxide/sulphuric acid is used in conjunction with acetone as solvent. Oxidation was too rapid to allow for the appearance, with the dihydroxy porphyrins, of compounds with a single oxidized hydroxyl group. The order of reactivity in the porphyrin series of compounds was $CH_2OH > -CHOHCH_3 >>> -CHO$. Thus mono- and di-hydroxymethyl, or hydroxyethyl, deuteroporphyrins were converted to the corresponding formyl or acetyl porphyrins in high yield. 2-formyl 4-hydroxyethyl could be oxidized to 2-formyl 4-acetyl-deuteroporphyrin, little of the carboxy compound being formed. Where oxidation of the formyl group was preferentially required, the hydroxyl groups could be protected by acetylation. In this way 2-formyl 4-hydroxyethyl-deuteroporphyrin was converted to 2-carboxy 4-hydroxyethyl-deuteroporphyrin and 2-hydroxymethyl 4-formyl-deuteroporphyrin to 2-hydroxymethyl 4-carboxy-deuteroporphyrin. The formyl groups could be completely protected by formation of a Girard complex, but usually this device was not required.

In the dihydroporphyrin series (chlorins, rhodins) rhodin g_7 alcohol (derived from rhodin g_7 by reduction of the 3 formyl group with $NaBH_4$) was smoothly oxidized by this technique to the formyl compound, though care was required to avoid over-oxidation as the dihydroporphyrin ring tends to break down more readily than the porphyrin nucleus. The presence of side reactions was more marked in the case of the 2-α-hydroxyethyl compounds derived from phæophorbide *a*, pyrophæophorbide *a*, rhodochlorin and pyrochlorin[3], where a second compound with an oxyporphyrin type spectrum and a low Willstatter-hydrochloric acid number was obtained. The appearance of this type of degradation product on oxidation of the chlorin 2-hydroxyethyl compounds and its absence from the 3-hydroxymethyl compound are probably related to the significantly slower rate of oxidation of the secondary alcohol.

The procedure for oxidation was as follows. A few mgm. of the tetrapyrrole in 5 ml. of acetone, freshly distilled over potassium permanganate, cooled to 0° C., was treated under a nitrogen atmosphere with a very small drop of the chromium trioxide reagent which had previously been flushed with nitrogen. The drop was applied to the side of the test-tube and washed down by the acetone. The spectrum of the compound rapidly changed to that of the acid form and the formation of the oxidized product could be followed with a hand spectroscope.

On completion of oxidation—a matter of a few seconds—the acetone solution was poured into ether over 0·2 per cent sodium bicarbonate, and the ether then washed well with water. Any degradation product due to cleavage of the tetrapyrrole ring structure was washed out of the ether solution. When oxidation of the formyl group was required, the methyl ester was used since the carboxy porphyrin could afterwards be easily separated from non-acidic material by extraction with 1 per cent sodium carbonate.

Experiments were carried out using chromium trioxide dissolved in acetone for the oxidation of hæmatoporphyrin in the same solvent. With this system the porphyrin retained its neutral spectrum and the rate of oxidation of the hydroxyl group was much slower than with the Jones reagent, so that a mixture of the mono- and di-acetyl porphyrin was obtained. These products were readily separated by hydrochloric acid–ether fractionation and by alumina chromatography of the methyl esters.

Specific oxidation of a primary or secondary alcohol or of a formyl group was sometimes required. Manganese dioxide (prepared by the method of Attenburrow *et al.*[6]) in chloroform oxidized hydroxymethyl groups in the porphyrin series to formyl, hydroxyethyl groups remaining unaffected. Mono- and di-hydroxymethyl-deuteroporphyrin, 2-hydroxymethyl 4-vinyldeuteroporphyrin, 2-hydroxymethyl 4-hydroxyethyl-deuteroporphyrin and porphyrin *a* alcohol were in this way oxidized to formyl compounds, the vinyl and the secondary alcohol being unaffected. With the 2-hydroxymethyl compounds, 50 per cent oxidation took place within 1 hr., but in the case of compounds with the hydroxymethyl at the 4-position the complete oxidation required 12 hr. No detectable oxidation of the 3-hydroxymethyl group of rhodin g_7 alcohol was obtained with this reagent even after 72 hr.

Attempts to obtain specific oxidation of hæmatoporphyrin with aluminium-*iso*propoxide or butoxide, using acetone or *cyclo*hexanone, under reflux, did not give practical yields of the di-acetyl porphyrins, so that no specific method is available for the secondary alcohol.

Silver oxide has been used for oxidation of aldehydes[7] and Nicolaus[8] has prepared a pyrrolic acid with a carboxy side-chain, using silver oxide generated *in situ*. With formyl porphyrins we could not obtain more than a trace of the carboxy compound after prolonged treatment with either silver oxide previously prepared or precipitated *in situ* in alkaline media.

Lemberg and Parker[9] using potassium permanganate in acetone oxidized protoporphyrin to obtain chlorocruoroporphyrin and some diformyl and carboxy porphyrin, the relative proportions depending mainly on the concentration of the reactants. We thought it likely that oxidation beyond the chlorocruoroporphyrin stage might be reduced if the reaction was carried out at room temperature. The concentration of potassium permanganate (0·64 m.mole in 500 ml.) and of protoporphyrin (0·17 m.mole in 400 ml.) in acetone was the same as that found by Lemberg and Parker to give good yields of chlorocruoroporphyrin. To a solution of the porphyrin in acetone, potassium permanganate in the same solvent was added over a period of several minutes. A fine precipitate of manganese oxide formed after 10 min. or so, and oxidation was usually complete after 1 hr. The precipitate was spun off and the porphyrin taken into ether, and this washed thoroughly with water.

The addition of only a small amount of potassium permanganate resulted in the formation of formyl porphyrin from protoporphyrin, detectable by the appearance of a band at 556 mμ in the acetone solution. On further addition of potassium permanganate this band increased in density until it was much stronger than the 537 mμ of the remaining non-formyl porphyrin. But even when the potassium permanganate/protoporphyrin molar ratio was raised to 10 an absorption band was still visible at 537 mμ and this band was shown to be due to an oxyporphyrin (order of band intensity I, IV, III, II). At these higher concentrations of potassium permanganate some diformyl porphyrin was formed, but very little carboxy porphyrin. When chlorocruoroporphyrin or porphyrin *a* (porphyrins which have a vinyl group in the 4 position[10,11]) were treated similarly no oxidation of the respective vinyl groups was effected.

A similar resistance of the vinyl group in the compounds was found on hot oxidation with potassium permanganate, even when the concentration of the reactants was increased several-fold, although traces of the diformyl compound were obtained from chlorocruoroporphyrin, and from porphyrin *a* (Lemberg, unpublished work). But if the formyl group of chlorocruoroporphyrin or porphyrin *a* was reduced with borohydride prior to potassium permanganate treatment, then it was found that the vinyl group in these compounds was oxidized to a formyl, though less readily than with the 2 vinyl groups of protoporphyrin. Thus a new formyl porphyrin has been obtained from chlorocruoroporphyrin alcohol and porphyrin *a* alcohol respectively. That from the latter has absorption bands III and IV at 555 mμ and 514 mμ respectively (ratio III/IV = 1·3) in ether.

The hydroxyethyl groups of hæmatoporphyrin were completely resistant to oxidation with potassium permanganate in acetone by the method outlined above, even on refluxing for an hour. On cold oxidation monohydroxymethyl-deuteroporphyrin yielded about 1 per cent of formyl porphyrin, while refluxing for 1 hr. increased this to 5 per cent, so that vinyl groups in a hydroxylated porphyrin may be selectively oxidized by this method without the necessity of first protecting the hydroxyl groups by acetylation.

From these experiments it is evident that a formyl exerts an inhibitory effect on the rate of oxidation of a double bond conjugated to the nucleus, and secondly, that a vinyl group in the 2 position is much more reactive than one in the 4 position. From the evidence of the manganese oxide oxidation and other experiments carried out in this laboratory it is likely that other side-chains may exhibit this increased reactivity when situated in the 2 position of the tetrapyrrole nucleus. We propose to extend this investigation by examining the relative reactivities of substituents when present on different β positions of the tetrapyrrolic ring system.

Table 1

Substituted deuteroporphyrin	Absorption bands (mμ) I	II	III	IV	Spectral type (ref. 12)
Monoformyl monacetyl	646	587	561	521	Aetio
Monoformyl monohydroxyethyl	641	581	556	516	Rhodo
Monoformyl monohydroxymethyl	641	581	556	516	Rhodo
Monocarboxy monovinyl	636	581	550	512	Rhodo
Monocarboxy monohydroxyethyl	634	579	547	510	Rhodo
Monocarboxy monohydroxymethyl	634	578	547	510	Rhodo
Dihydroxymethyl	624	569	529	498	Aetio

Table 1 gives the position of the absorption bands, in chloroform, of a number of new porphyrins (dimethyl esters) which have been prepared in this study.

This work was supported by grants from the National Health and Medical Research Council of Australia.

HIGH PREVALENCE OF HIGH-LEVEL β-AMINO-*ISO*BUTYRIC ACID EXCRETORS IN MICRONESIANS

By Dr. B. S. BLUMBERG

National Institute of Arthritis and Metabolic Diseases,
National Institutes of Health, Bethesda 14, Maryland

AND

Dr. S. M. GARTLER*

Department of Medicine, School of Medicine, University of Washington, Seattle 5, Washington

DIFFERENTIAL excretion of β-amino-*iso*butyric acid is under genetic control, and family data indicate that a single major gene pair is responsible for most of the variations[1,2]. High excretors are homozygous for a single recessive gene and low excretors either heterozygous or homozygous for the dominant allele. Striking differences in the prevalence of high excretors in various populations have been demonstrated and it appears that this genetic polymorphism may be of considerable value in anthropogenetic investigations[3,4].

We are particularly interested in utilizing this trait to explore the genetic relationships and origins of various Pacific peoples and this report extends our observations on excretion of β amino-*iso*butyric acid to the Micronesians inhabiting the Marshall Islands. The fact that some of the Micronesians were exposed to considerable radiation in 1954 is of special interest here. It is known that radiation exposure can temporarily at least increase β-amino-*iso*butyric acid excretion[5], and the Marshallese population permits an examination of possible long-term effects of such exposure on β-amino-*iso*butyric acid excretion.

The following information on the radiation exposure and present status of the inhabitants of Rongelap and Utirik was obtained from the reports of the Brookhaven National Laboratory[6], and from Dr. R. A. Conard of Brookhaven National Laboratory.

Micronesian inhabitants of Rongelap and Utirik atolls, Marshall Islands, were accidentally exposed to fallout in March 1954, following the detonation of a high-yield thermonuclear device during experiments at Bikini Atoll in the Pacific Proving Grounds. Sixty-four inhabitants of Rongelap received an estimated dose of 175 r whole-body γ-radiation, 18 Rongelap people on Ailingnae received about half this dosage, and 157 of the people on Utirik received about 14 r whole-body radiation. The exposed people were evacuated to radiation-free islands in the Marshalls. The Utirik inhabitants were repatriated soon after their evacuation when it was determined that the island was safe for habitation. The exposed Rongelapese, as well as some 150 unexposed relatives, were returned to Rongelap in July 1957 when the radiological hazard was judged to have been terminated. There was, however, slight residual radioactivity remaining on the island, and the body burdens of radioactive substances, particularly of cæsium-137 and zinc-65, and urinary excretion of nucleotides has risen in the Rongelapese since their return. Both the originally exposed and the unexposed people now have increased body burden, with no significant differences between the two groups. The body burden of these radionuclides is below the maximum permissible levels.

Rongelap is in the western (Ralik) chain and Utirik in the eastern (Radak) chain of the Marshall Islands. Some differences in language and customs prevail between these two groups, but for most purposes the people of Rongelap and Utirik may be considered to be closely related racially.

Rongelap urines from 65 exposed (including 12 urines from individuals exposed on Ailingnæ), 119 unexposed and 4 unidentified people were collected in plastic bottles containing thymol preservative. The sample represents 75.7 per cent of the population of the village at the time of the visit. The sexes were equally represented, and the ages of the subjects varied from 3 years to more than 70 years. In some cases, several members of the same family were included, and some kinships suitable for genetic analysis were available. Eighteen samples randomly selected on Utirik were also studied. The urines were kept at 4° C. and shipped in refrigerated containers to Seattle for analysis. Studies were completed 2–3 weeks after collection of specimens. Determinations of β-amino-*iso*butyric acid were carried out by high-voltage electrophoresis on paper[7] and creatinine was determined by the alkaline-picrate method.

During the course of the medical evaluation of the Rongelapese by Conard and his associates, the body burdens of nucleotides were determined[6]. Through the courtesy of Dr. S. Cohn of the Brookhaven National Laboratory, who performed these measurements, the body burdens of cæsium-137 and zinc-65

---

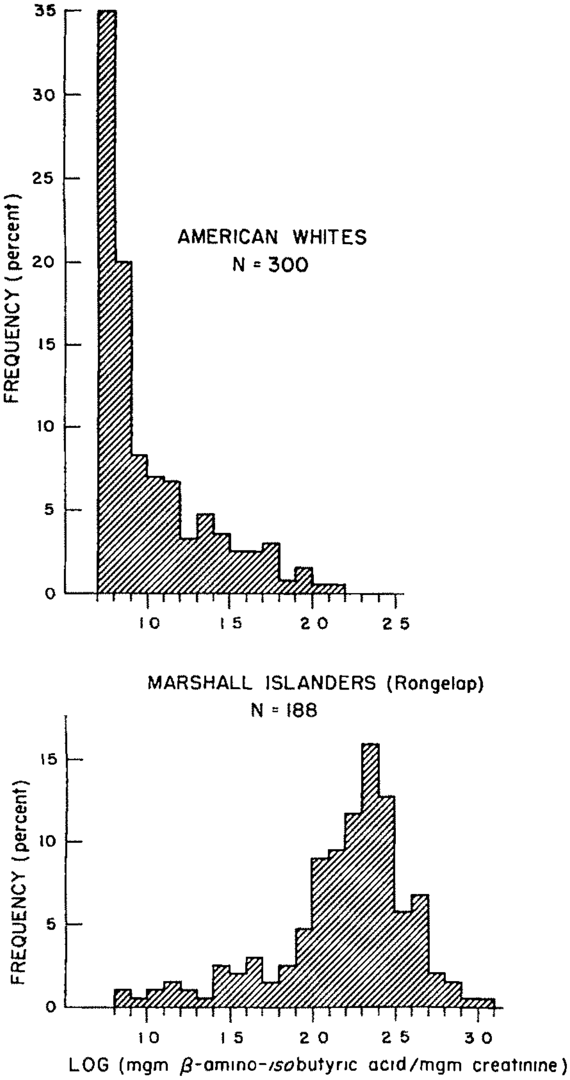

Fig 1 Frequency distributions of urinary excretion-rates of β-amino-*iso*butyric acid of Marshall Islanders (Rongelap) and U S A Whites

of the individuals on whom determination of β-amino-*iso*butyric acid had been made were supplied to us The availability of these data gave us an opportunity to determine if these low levels of radioactivity had any effect on the excretion of β-amino-*iso*butyric acid

In Fig 1 the frequency distribution of β-amino-*iso*butyric acid excretion for the Rongelapese is presented A similar histogram for a New York City white population is included for comparative purposes The two distributions are essentially complementary to one another, and if superimposed exhibit bimodality with the antimode in the neighbourhood of 1 75 Taking this point as the division between high and low excretors, it is estimated that nearly 90 per cent of the Rongelapese are high excretors A breakdown of this population into exposed and unexposed groups shows almost identical mean β-amino-*iso*butyric acid excretion values for the two categories (exposed 2 07 ± 0 06 and unexposed 2 10 ± 0 04) A scatter plot between cæsium-137 levels and β-amino-*iso*butyric acid-level shows no correlation (Fig 2), and a similar plot between zinc-65 levels and β-amino-*iso*butyric acid shows no correlation either The mean β-amino-*iso*butyric acid excretion level for 18 Micronesians, who were on Utirik at the time of the atomic explosion and therefore not exposed to significant radiation, was 2 21 ± 0 13, which is extremely close to the mean value reported for the Rongelapese above 83 per cent of the Utirik people were high excretors, and this is not significantly different from the prevalence in the Rongelap group A number of families are included in the Rongelap data (that is, father, mother and at least one child), and of them the high excretor by high excretor matings are the only ones with significant genetic information There were 11 such matings with a total of 31 offspring (29 high excretors and 2 low excretors) One of the low excretor offspring was illegitimate, as determined by blood group data, leaving one unexplainable exception to genetic hypothesis

Rubini *et al*[5] have recently demonstrated that β-amino-*iso*butyric acid excretion can be a sensitive indicator of radiation exposure The mechanism involved is probably the same as that underlying the effect of nitrogen mustard on β-amino-*iso*butyric acid excretion[8] Such agents markedly increase breakdown of deoxyribonucleic acid, the thymine thus released is effectively converted to β-amino-*iso*butyric acid in man[7,8] and excreted into the urine since no appreciable tubular re-absorption of β-amino-*iso*butyric acid occurs[9] It is unlikely that the high prevalence of high-level β-amino-*iso*butyric acid excretors found in Rongelap is due to radiation The identical average β-amino-*iso*butyric acid values in the exposed and unexposed group precludes the possibility that the elevation is due to the fallout exposure in 1954, and it appears that there is no long-term effect of radiation exposure (at the levels received on Rongelap) on β-amino-*iso*butyric acid excretion The lack of correlation with the cæsium-137 and zinc-65 body burdens rules against the elevation being due to the present radiation-level The nearly identical values in the Utirik group who received a very small dose of radiation, and who have much lower body burdens of radionuclides, is also consistent with the thesis that a high prevalence of the gene underlying β-amino-*iso*butyric aciduria is responsible for the observed β-amino-*iso*butyric acid excretion-rate The expression of the normal genetic difference is probably due to differential metabolism of β-amino-*iso*butyric acid by high and low excretors[9]

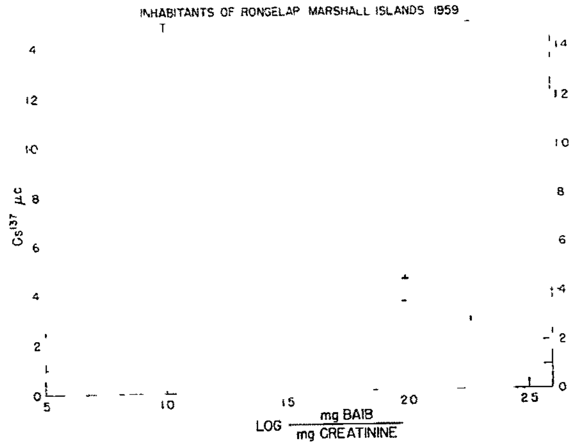

Fig 2 Urinary β-amino-*iso*butyric acid excretion (log mgm β-amino-*iso*butyric acid/mgm creatinine) versus body-load of cæsium-137 (μc)

The level of β-amino-*iso*butyric acid excretion among the Marshallese is the highest yet reported for any population Blood group[10] and other anthropological data on these people suggest a south-east Asiatic origin for them which, if true, predicts a high β-amino-*iso*butyric acid level for the populations of that region Studies of some Asiatic populations have given relatively high β-amino-*iso*butyric acid values, which suggest that there may be an Asian focus for the high β-amino-*iso*butyric acid excretor gene We are at present sampling other Asian populations to determine if this is true and to find some clue to the population dynamics affecting this polymorphism

Table 1. FREQUENCY OF HIGH EXCRETORS IN VARIOUS POPULATIONS

Population	Sample size	Percentage of high excretors	Ref
U S A Whites	218	10 2	11
Alaskan Eskimo	120	23 3	4
Alaskan Athabascan Indians	25	56 0	4
Apache Indians	110	59 2	2
Rongelap Islanders (Marshallese)	188	86 0	—
Utirik Islanders (Marshallese)	18	83 0	—

We are indebted to Dr. R A Conard, Brookhaven National Laboratory, New York, leader of the medical survey to Rongelap, for permission to collect the urines and for his help in completing this study This work was supported in part by a grant (to S M G) from the National Science Foundation (*NSF-G*6187) and the United States Public Health Service (*H*-3091)

REPLICATION OF TOBACCO MOSAIC VIRUS

By STAFF of the HENRY SHAW SCHOOL OF BOTANY and the ADOLPHUS BUSCH III LABORATORY of MOLECULAR BIOLOGY

Washington University, St Louis, Missouri

Kinetics of Virus Protein and Ribonucleic Acid Biosynthesis

By PROF. BARRY COMMONER, DR JAMES A. LIPPINCOTT and DR JANEY SYMINGTON

PROPOSALS regarding the mode of replication of a virus must be consistent with evidence on the biosynthesis of the virus substance In the case of tobacco mosaic virus, it is known that both the protein and ribonucleic acid parts of the virus ribonucleoprotein are synthesized *de novo* in the infected cell from low molecular weight precursors[1] , but this result places only a relatively slight restriction on theories of replication In the present article we report isotope experiments which describe the rates of synthesis of tobacco mosaic virus protein and ribonucleic acid at various times during the infection process and the biosynthetic origin of protein and ribonucleic acid residues that occur in different parts of the virus rod The results lead to a more detailed characterization of biosynthesis of tobacco mosaic virus and thereby provide further limitations on possible theories of replication of tobacco mosaic virus, the consequences of which are considered in an article which follows

In these experiments nearly mature leaves of *N tabacum* (var White Burley) plants were inoculated with the standard Johnson strain of tobacco mosaic virus and maintained thereafter at constant illumination averaging about 500 foot-candles, and a temperature of 24° C At a given interval after inoculation about 40 gm of blade tissue was removed from the inoculated leaves and exposed to carbon dioxide labelled with carbon-14 (0 07 per cent in air, 33 × 10^6 c p m /mgm carbon) under about 500 ft -candles of illumination for measured periods of time Unlabelled 5 per cent carbon dioxide was then flushed through the system for a period of 10 min The leaf tissue was then frozen in liquid nitrogen and the virus isolated by procedures described previously[2]

Tobacco mosaic virus purified by 6 cycles of alternate low-speed centrifugation (2,500*g*, 1 hr), and ultracentrifugation (105,000*g*, 1 hr), several isoelectric precipitations and dialysis exhibits a constant carbon-14 level on reprecipitation Since the virus protein is 95 per cent of the mass of tobacco mosaic virus and (as will be shown below) the specific activity of virus ribonucleic acid is somewhat less than that of whole virus, the specific activity of whole tobacco mosaic virus may be taken as representative of the specific activity of the virus protein To determine the specific activity of virus ribonucleic acid without interference from tobacco mosaic virus protein it is convenient to convert it to nucleotides For this purpose ribonucleic acid is isolated from the virus by the heat method[3], and hydrolysed in 0 3 *M* potassium hydroxide for 18 hr at 37° C The solution is acidified to *p*H 2, and the nucleotides adsorbed on charcoal, which is then washed twice with distilled water The nucleotides are then eluted from the charcoal by two portions of 1 per cent ammonium hydroxide in ethanol, and separated by paper electrophoresis[4]

The virus content (*V*) per gram (wet weight) of infected leaf was determined by methods described

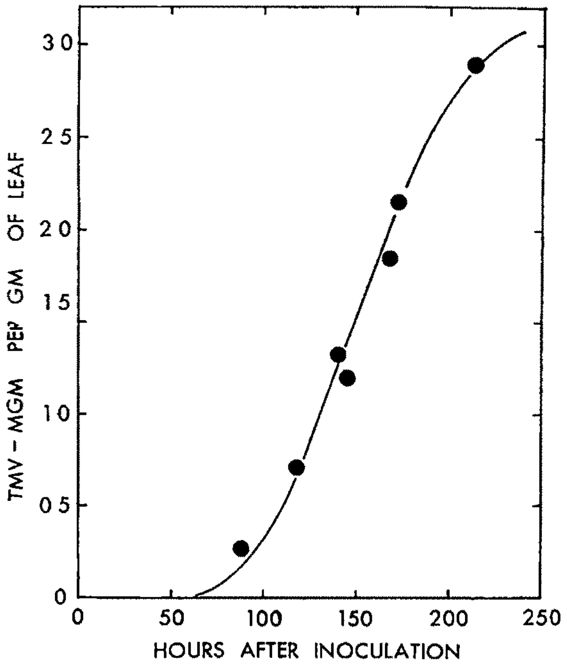

Fig 1 Tobacco mosaic virus content of tobacco leaf tissue at various times after inoculation with tobacco mosaic virus The points are derived from mature leaves removed from separately infected plants at the indicated time after inoculation Plants were maintained at 24° C , and about 500 ft -candles of continuous illumination following inoculation

earlier[5] Fig 1 shows the virus content of the infected leaf at various times after inoculation The curve is a typical one for White Burley tobacco leaves under these experimental conditions[5] From this curve it is possible to estimate the increment in virus content (ΔV) which occurs in the leaf during the time of isotope incorporation Since these times (3–45 min) are very short relative to the overall time-course of virus synthesis (several hundred hours), the amount of new virus synthesized during isotope incorporation is a small part (less than 1 per cent) of the virus present, so that ΔV cannot be measured directly However, the rate of virus formation in the tissue (K_s) can be estimated, for any given time after inoculation, from the slope of the curve of Fig 1 Within the short period of isotope incorporation (Δt) this rate is, in effect, constant, so that ΔV can be estimated from the relationship

$$\Delta V = K_s \, \Delta t \qquad (1)$$

The value of ΔR, the amount of virus ribonucleic acid synthesized during the time Δt, can be determined in the same way, the ribonucleic acid content of tobacco mosaic virus being about 5 2 per cent

Accordingly, for any given infected tissue exposed to labelled carbon dioxide for a period of time, Δt, it is possible to determine the values of V, ΔV, S_v (the specific activity of the total virus), and S_r (the specific activity of virus ribonucleic acid) A series of such measurements have been obtained from virus isolated from leaf tissue which had been removed from infected plants at various times after inoculation, and then exposed to labelled carbon dioxide for one or more periods of time between 3 and 45 min The results, which are plotted in Fig 2, show that within a relatively narrow range of variability, the values of $S_v V/\Delta V$ and $S_r V/\Delta V$ are proportional to Δt if the latter does not exceed 30 min

We may therefore state that .

$$\frac{S_v V}{\Delta V} = K_v \Delta t \qquad (2)$$

and

$$\frac{S_r V}{\Delta V} = K_r \Delta t \qquad (2a)$$

where K_v and K_r are, for the present, designated simply as the relevant constants of proportionality

The significance of this observation is apparent from the following considerations Tobacco mosaic virus, once formed, is metabolically inert[1] Hence, in these experiments only the virus synthesized during the period of isotope incorporation contains carbon-14, and its isotope content is diluted by the pre-existing unlabelled virus Hence

$$S_{\Delta V} = \frac{S_v V}{\Delta V} \qquad (3)$$

and

$$S_{\Delta R} = \frac{S_r V}{\Delta V} \qquad (3a)$$

where ΔV is the amount of virus newly formed in time, Δt, $S_{\Delta V}$ is the specific activity of newly formed virus, and $S_{\Delta R}$ is the specific activity of the ribonucleic acid in the newly formed virus The observations reported in Fig 2 and the empirical relationships expressed in equations (2) and (2a) mean that the specific activities of the total mass of the newly formed virus (which may be equated with its protein) and of its ribonucleic acid increases linearly with the time of incorporation of labelled carbon dioxide K_v and K_r, which are constant with variations in time after inoculation, therefore, represent the rates at which the protein and ribonucleic acid complements of newly formed tobacco mosaic virus increase in specific activity

These conclusions lead to certain further characterizations of the biosynthetic process Since tobacco mosaic virus is metabolically inert, the amount of carbon-14 present in the virus formed during a given period of isotope incorporation (C) is equal to the amount of carbon-14 present in the source material

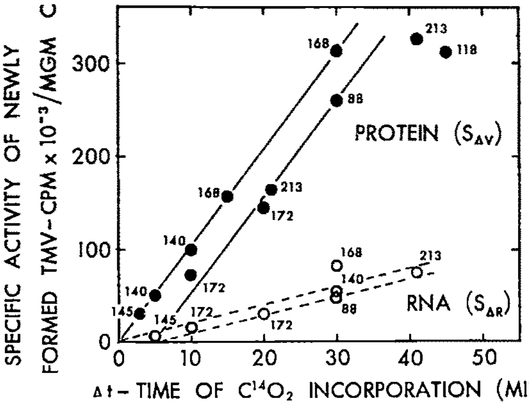

Fig 2 Relationship between the specific activity of protein and ribonucleic acid in newly formed tobacco mosaic virus and time of incorporation of labelled carbon dioxide Specific activity of newly formed protein is determined from the quotient $S_v V/\Delta V$ Specific activity of newly formed ribonucleic acid is determined from $S_r V/\Delta V$ (see text for details) Closed circles, protein values , open circles, ribonucleic acid values Numbers near individual points indicate the number of hours after inoculation with tobacco mosaic virus when leaf tissue was removed from plant and exposed to labelled carbon dioxide Lower solid line and lower broken line indicate maximum intercepts on Δt axis that are compatible with the data Data are derived from tissues described in Fig 1, all of which were cultured under the indicated uniform conditions

converted into virus during that period. Hence C_v will reflect the specific activity, Sp, of the pool of source material. Tobacco mosaic virus is synthesized from material common to the normal cellular metabolic pool, and we may expect the mass of this pool to remain relatively constant during the brief period of incorporation of carbon-14. In this case, Sp will increase from its initial value of zero linearly with Δt, so that

$$Sp = k_v \Delta t \qquad (4)$$

where k_v is the rate of increase in specific activity of the metabolic pool that serves as a source of virus substance.

The rate of change of C_v with time will depend on Sp and on the rate at which substance is transferred from the metabolite pool to virus. The latter rate is identical with the rate of tobacco mosaic virus synthesis, K_s, so that

$$\frac{dC_v}{d\Delta t} = S_p K_s = k_v \Delta t K_s$$

and

$$dC_v = k_v K_s \Delta t \, d\Delta t$$

Therefore, on integration between the limits C_v and $C_v = 0$ and Δt and $\Delta t = 0$

$$C_v = \frac{k_v}{2} K_s \, (\Delta t)^2 \qquad (5)$$

Since the isotope content of the virus is the product of its mass (V) and specific activity (S_v)

$$C_v = S_v V = \frac{k_v}{2} K_s \, (\Delta t)^2$$

However, from equations (1) and (2) it is known also that

$$S_v V = K_v K_s \, (\Delta t)^2$$

so that

$$K_v = \frac{k_v}{2} \qquad (6)$$

Analogous considerations with regard to k_r, the rate at which the metabolic precursors of virus ribonucleic acid increase in specific activity, lead to the conclusion that

$$K_r = \frac{k_r}{2} \qquad (6a)$$

These results show that the empirical observations expressed in equations (2) and (2*a*) are an expected consequence of the kinetic relationships between the tobacco mosaic virus in infected tissue and the metabolic precursors of virus protein and ribonucleic acid. They also serve to specify quantitatively the parameters which connect the rate of increase in specific activity of virus substance, and the rate of increase in the specific activity of its immediate precursors.

The most probable sources of tobacco mosaic virus protein and ribonucleic acid are the free amino-acids and ribonucleotides of the leaf. To test the relationships just described, we have in two instances estimated the values of k_v and k_r by determining the levels of carbon-14 attained by the free amino-acids and ribonucleotides found in virus-infected tobacco leaf after 30-min. periods of incorporation of labelled carbon dioxide.

The source material relevant to virus protein synthesis is that mixture of free amino-acids which is identical in composition to tobacco mosaic virus protein. However, it was possible to isolate in quantities sufficient for analysis of carbon-14 only six free amino-acids, which in aggregate account for 48 per cent of the virus protein. Their specific activities when isolated from two separate batches of leaf after 30 min. assimilation of labelled carbon dioxide are reported in Table 1. The weighted mean specific activities for this amino-acid pool yield an average specific activity, for the two cases, of 600 ± 120 c.p.m. × 10^{-3} per mgm. of amino-acid carbon.

Table 1. SPECIFIC ACTIVITIES OF FREE AMINO-ACIDS ISOLATED FROM TOBACCO MOSAIC VIRUS-INFECTED TOBACCO LEAF

Free amino-acid	Per cent of TMV protein	Preparation I		Preparation II	
		Specific activity (c.p.m. × 10^{-3} per mgm. C)	Specific activity × per cent of TMV protein	Specific activity (c.p.m. × 10^{-3} per mgm. C)	Specific activity × per cent of TMV protein
Aspartic	13.8	331	46	305	42
Glutamic	11.0	942	104	61	7
Serine	6.9	2,332	161	2,181	151
Glycine	2.1	184	4	329	7
Threonine	9.7	254	25	206	20
Alanine	4.8	137	7	62	3
Total	48.3		347		230
Total TMV	100		722		478

Free amino-acids were isolated from extracts prepared by homogenizing frozen leaf tissue after 30 min. of incorporation of labelled carbon dioxide in the light (followed by 10 min. of excess normal carbon dioxide) in 80 per cent ethanol. Amino-acids were purified by adsorption and elution from 'Dowex 50', and then separated by paper chromatography in a phenol–water solvent (*p*H 12). Streaks representing individual spots were localized by means of a ninhydrin spray, and then eluted. Amino-acid content of eluates was determined by Moore and Stein's quantitative ninhydrin method (ref. 10) and an aliquot counted for carbon-14 activity. Individual counts were in the range of 40–6,000 c.p.m., on amounts which varied from 0.4 to 12 μgm. Preparation I was isolated from infected tissue at 126 hr. after inoculation, and Preparation II at 146 hr. after inoculation.

Corresponding results for ribonucleic acid are shown in Table 2. In each experiment it was possible to isolate only two of the required four free ribonucleotides. However, since the specific activities of each nucleotide in the virus ribonucleic acid were determined, the missing values may be estimated on the assumption that the relative specific activities of the nucleotides in ribonucleic acid reflect the differences among the free ribonucleotides. In the two experiments it was found that after 30 min. of incorporation of labelled carbon dioxide, the average specific activity of the pool of free ribonucleotides relevant to biosynthesis of virus ribonucleic acid is 180 ± 60 c.p.m. × 10^{-3} per mgm. carbon.

From the foregoing results we may estimate the values of k_v and k_r as 20,000 ± 4,000 and 6,000 ± 2,000 c.p.m./mgm. of carbon/min., respectively. As indicated earlier, on the assumption that virus protein and ribonucleic acid are synthesized from free amino-acids and ribonucleotides, respectively, these values of k_v and k_r should be twice the values of K_v and K_r.

Table 3 reports the values of K_v and K_r derived from the specific activities of tobacco mosaic virus isolated from the tobacco leaf at various times after inoculation. The values are relatively constant. The mean value of K_v is 8,722 ± 617, the mean value of K_r is 1,818 ± 174 c.p.m./mgm. of carbon/min. Within the range of analytical variation inherent in the rather limited data on free amino-acids and ribonucleotides, these values conform to the relationships expected from the considerations summarized

Table 2. SPECIFIC ACTIVITIES OF FREE RIBONUCLEOTIDES AND OF RIBONUCLEOTIDES ISOLATED FROM TOBACCO MOSAIC VIRUS RIBONUCLEIC ACID FROM INFECTED TOBACCO LEAF

Nucleotide	Molar ratio in TMV RNA	Specific activity—c.p.m. $\times 10^{-3}$ per mgm. C					
		Preparation I			Preparation II		
		Virus RNA nucleotides	Free leaf nucleotides	Specific activity of free nucleotides × molar ratio	Virus RNA nucleotides	Free leaf nucleotides	Specific activity of free nucleotides × molar ratio

Uridylic acid	26.0	0.248	(146)	(38)	0.075	81	21
Total RNA	100			247			113

Free ribonucleotides were isolated from an extract prepared by homogenizing infected leaf (after 30 min. of incorporation of labelled carbon dioxide in the light and 10 min. of normal carbon dioxide) in 0.6 *M* perchloric acid. Ribonucleotides in the neutralized extract were purified by chromatographic separation on a 'Dowex 1' column. Fractions obtained by this means were then further purified by adsorption and elution from charcoal and by paper electrophoresis, the last two steps being repeated to yield the final sample for carbon-14 determination. Carbon-14 counts were in the range of 6–127 c.p.m.; amounts of nucleotides counted were in the range of 0.40–1.2 μgm. Nucleotides were isolated from tobacco mosaic virus extracted from the same tissue samples according to methods described in the text. Figures in parenthesis are estimated on the assumption that the relative specific activities of the 4 nucleotides in virus ribonucleic acid are in the same proportion as the specific activities of the respective free ribonucleotides.

in equations 1–6*a*. This result tends to validate the biosynthetic mechanism which these equations describe. A major feature of this mechanism of biosynthesis of tobacco mosaic virus is that the rates of synthesis of virus substance from the relevant precursors are identical with K_s, the rate at which tobacco mosaic virus appears in the tissue in its completed extractable form. It would appear, therefore, that throughout the period of the infection process encompassed by our results, tobacco mosaic virus rods are formed about as fast as their protein and ribonucleic acid constituents are synthesized from free amino-acids and ribonucleotides. These observations suggest that throughout the infection process the rates of synthesis of tobacco mosaic virus protein and ribonucleic acid are in the ratio of their respective contributions to the virus mass, and are synchronized with the process which achieves the formation of the completed virus rod.

In an effort to explore further the mechanism of virus synthesis, we have investigated the distribution of carbon-14 in various linear regions of the virus rod. In a previous paper[6] we reported means for the removal of measured linear sections of protein and ribonucleic acid from one end of the tobacco mosaic virus rod. Protein is removed by means of a graded series of treatments in a detergent solution. A corresponding terminal section of the virus ribonucleic acid fibre is thereby exposed, all or part of which can then be removed by incubating the rod in pancreatic ribonuclease or snake venom diesterase.

Some of the labelled tobacco mosaic virus preparations isolated during the course of the foregoing experiments were analysed in further detail by means of this technique. Protein representing measured terminal sections of the total length of the tobacco mosaic virus rod was removed and the carbon-14 specific activities determined. From the differences between the sizes and specific activities of successively larger terminal sections one can calculate the carbon-14 specific activities of serial segments of the rod.

Results of such analyses are shown in Fig. 3. These show that the distribution of carbon-14 in the virus protein is not uniform along the length of the rod. Excess carbon-14 is found in the more distal segments of the rod, especially in the first 5–10 per cent of its length. The disproportionate accumulation of carbon-14 in terminal sections is most pronounced

Table 3. CALCULATION OF RATES OF INCREASE, WITH TIME OF CARBON-14 INCORPORATION, IN SPECIFIC ACTIVITIES OF TOBACCO MOSAIC VIRUS PROTEIN (K_v) AND RIBONUCLEIC ACID (K_r)

Hr. after inoculation	V (mgm. of TMV carbon per gm. leaf)	K_s (mgm. of TMV carbon per hr.)	Δt (min.)	ΔV (mgm. of TMV carbon per gm. leaf)	S_v (c.p.m. per mgm. TMV carbon)	S_r (c.p.m. per mgm. TMV RNA carbon)	$K_v = S_vV/\Delta V\,\Delta t$	$K_r = S_rV/\Delta V\,\Delta t$

						Average	8,722 (±617)	1,818 (±174)

V is the virus content of the infected leaf; K_s is the rate of increase in virus content determined from a plot of V against hours after inoculation (see Fig. 1); Δt is the time of incorporation of labelled carbon dioxide in the light (in each case followed by a 10-min. period of incorporation of normal carbon dioxide in the light). ΔV is the increment in virus content during the time Δt, calculated from the values of K_s and Δt; S_v is the specific activity of tobacco mosaic virus isolated from the tissue, which is equivalent to the specific activity of virus protein; S_r is the specific activity of virus ribonucleic acid, determined from the specific activities of the nucleotides isolated from the ribonucleic acid; K_v and K_r are respectively the rate of increase in the specific activities of protein and ribonucleic acid in the newly formed tobacco mosaic virus, and have the dimension c.p.m. per mgm. tobacco mosaic virus carbon per min.

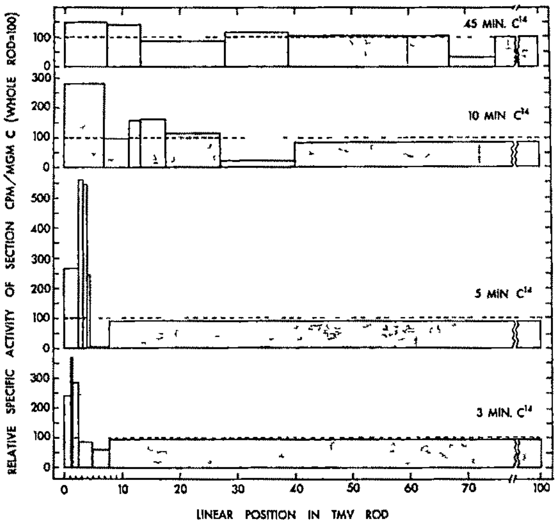

Fig 3 Carbon-14 levels in successive linear sections of virus protein isolated from four tobacco mosaic virus preparations The figure is based on specific activities found in successively longer terminal sections of virus protein removed from tobacco mosaic virus by the procedure described in the text Bars represent specific activities of indicated linear segments calculated from the differences between the specific activities of successively longer terminal segments Linear position is determined from the percentage of total virus protein represented by the given terminal segment

where relatively short periods of labelled carbon dioxide incorporation are employed Where the time of incorporation is longest (45 min) the carbon-14 distribution is nearly uniform

Corresponding investigations of the virus ribonucleic acid fibre were restricted by the relatively small amounts of material available However, single terminal segments of the virus ribonucleic acid representing from 5 to 10 per cent of the total ribonucleic acid fibre have been analysed Results of these experiments, reported in Table 4, show that, like the protein, the ribonucleic acid fibre also exhibits an excess of carbon-14 in the terminal sections

As shown earlier, the specific activity of the precursor materials from which tobacco mosaic virus protein and ribonucleic acid are synthesized increases with time after onset of labelled carbon dioxide Hence the simplest explanation of the excess carbon-14 found in terminal sections of the virus rod is that these sections are synthesized later than the basal portions of the rod This result suggests that the condensation of precursors of low molecular weight to form virus protein and ribonucleic acid occurs in a linear mode, so that biosynthesis represents an increase in the length of the rod Added to the earlier results on the kinetics of virus ribonucleic acid and protein synthesis, this conclusion suggests that tobacco mosaic virus is formed by a process which involves the synchronous extension of both protein and ribonucleic acid in the direction of the long axis of the virus rod

It was the aim of these studies to derive evidence on biosynthesis of tobacco mosaic virus which might help establish new restrictions on theory regarding the mechanism of replication of tobacco mosaic virus In what follows, the characteristics of biosynthesis of tobacco mosaic virus indicated by the foregoing experiments, which relate to this aim, are summarized

(1) *Tobacco mosaic virus is synthesized* de novo The present results confirm earlier observations, based on incorporation of nitrogen-15, phosphorus-32, as well as carbon-14, which showed that synthesis of tobacco mosaic virus occurs *de novo*, in the sense that the proximal sources of virus substance are low molecular weight residues, which are in turn in metabolic contact with carbon dioxide, ammonia and phosphate[1,7–9] The new results represent the shortest time-scales employed in such studies They show that within a 3–5 min period after onset of labelled carbon dioxide, labelled carbon penetrates the entire sequence of biochemical events beginning with carbon dioxide and ending with extractable high molecular weight rods of tobacco mosaic virus nucleoprotein

(2) *The maximum time required for the synthesis of a tobacco mosaic virus rod is about 5 min. ; unfinished virus never exceeds about 0 1 per cent of the tobacco mosaic virus in the leaf* The results in Fig 2 lead to an approximation of the maximum time required to accomplish the unique steps in the biosynthesis of tobacco mosaic virus Generally, virus biosynthesis may be represented by non-specific steps (assimilation of carbon, nitrogen and phosphorus, formation of requisite amino-acids and ribonucleotides) followed by processes uniquely associated with biosynthesis of tobacco mosaic virus, that is, synthesis of specific virus protein and ribonucleic acid, and their assembly into the final virus rod

In their unassembled form, the virus protein and ribonucleic acid may be regarded as pools which are supplied by the relevant metabolite precursors and which are depleted only by formation of the finished tobacco mosaic virus rod Carbon-14 supplied in the form of labelled carbon dioxide must pass through

Table 4 SPECIFIC ACTIVITIES OF TERMINAL SEGMENTS AND RESIDUAL PORTIONS OF TOBACCO MOSAIC VIRUS PROTEIN AND RIBONUCLEIC ACID

Protein segments were obtained by the method described in the text The terminal segment represents the low molecular weight protein sub-units which are separated from the residual high molecular weight protein of the virus rod by ultracentrifugation The length of the terminal segment is determined by Folin analysis of the protein content of the ultracentrifuge supernate Ribonucleic acid terminal segments were removed by treating protein-stripped rods with snake venom diesterase, the percentage of ribonucleic acid removed was determined from the nucleotide content (measured by ultra-violet absorption) of the ultracentrifuge supernate after the enzyme treatment Ribonucleic acid was extracted from the residual portion of the virus rod by the heat method Both terminal and residual ribonucleic acid were converted to nucleotides, and the carbon-14 contents determined as described in the text Counts of separate protein samples were in the range 7–96 c p m The range for ribonucleic acid samples was 2–44 c p m these pools before it appears in tobacco mosaic virus nucleoprotein. When the time of labelled carbon dioxide assimilation, Δt, is sufficiently long, the carbon in these pools approaches the specific activities of the materials entering them. When Δt is very small, the unlabelled substance of the pool of unassembled parts dilutes the entering isotope so that the pool's specific activity is appreciably less than that of the entering material.

As already indicated in these experiments the specific activity of metabolites increases with Δt. In these circumstances we may expect the specific activity of the pool of unassembled parts to increase at a rate which is proportional to that of the entering material when Δt is relatively large. However, when Δt is very small, the specific activity of the pool substance will increase at a smaller and accelerating rate. These effects will be reflected by the specific activity of the newly formed virus, which may be viewed as an aggregate of unassembled parts.

This means that in a plot of $S_{\Delta V}$ (or $S_{\Delta R}$) against Δt, such as Fig. 2, the initial part of the curve should show an accelerating rate of increase in $S_{\Delta V}$ which finally becomes constant. The intercept of the linear part of the curve on the Δt axis is an estimate of the time required for the pool of unassembled parts to approach the specific activity of its precursors. This value is, approximately, the average time which carbon entering the pool spends in it before leaving as a completed tobacco mosaic virus rod. In general, the intercept approximates the time required to synthesize the virus protein and ribonucleic acid and to assemble them into the tobacco mosaic virus rod, although no exact relationship can be given without knowing the mechanisms involved.

It is clear from Fig. 2 that given the experimental errors involved in determining $S_{\Delta V}$, the expected intercept is so close to zero as to be unascertainable. However, the results do permit an estimate of the largest intercept consistent with them. This is shown in Fig. 2 as the lower lines drawn through the protein and ribonucleic acid values. For both $S_{\Delta V}$ and $S_{\Delta R}$ the maximum intercept is about 5 min. The time required to synthesize a tobacco mosaic virus rod (t_a) is therefore between zero and 5 min.; considerably more refined measurements will be needed for a closer approximation of the true value. The time for rod synthesis lies between these limits throughout the period of the infection process that was studied.

The maximum value of t_a (that is, 5 min.) defines the maximum size of the pool of unassembled virus components (P), since $P = K_s t_a$. At 140 hr. after inoculation, when K_s is at a maximum (0·015 mgm. of tobacco mosaic virus carbon per gm. of leaf per hr.), the maximum value of P is about 0·001 mgm. of carbon per gm. of leaf, or about 0·1 per cent of the tobacco mosaic virus present.

Thus, the individual biosynthetic event appears to be very short compared to the time-scale of the overall course of tobacco mosaic virus synthesis in infected tissue (Fig. 1). This suggests that the observed variations in the total rate of tobacco mosaic virus synthesis with time after inoculation reflect changes in the number of active biosynthetic sites in the leaf. The virus enters the leaf through relatively few cells, the infection spreading radially from these foci[11]. It is to be expected, then, that with increasing time after inoculation the number of cells in which tobacco mosaic virus biosynthesis is active will at first increase exponentially, reach a maximum and then decline as the leaf becomes fully infected, and the first-infected cells stop forming virus. The amount of unassembled virus parts, though very small, is expected to vary in proportion to the changing number of biosynthetically active sites.

(3) *Virus protein and ribonucleic acid complements are synthesized from their respective precursors (free amino-acids and ribonucleotides) concurrently, at approximately equal rates.* Fig. 2 shows, from isotope data, that the rate of biosynthesis of the virus protein and ribonucleic acid complements are proportional to each other throughout the period of the infection process included within the period 88–213 hr. after inoculation. This relationship is expressed more explicitly in Fig. 4, which includes in addition to the data of Fig. 2, further observations made with infected tissue cultured under conditions different from those employed in the major part of our experiments. It was found also that the ratio between the carbon-14 levels of protein and ribonucleic acid isolated from a given preparation of labelled virus approximates the ratio of the specific activities of the amino-acids and ribonucleotides found in the infected leaf. It would appear, then, that the protein and ribonucleic acid complements of a given tobacco mosaic virus rod are synthesized at approximately equal rates, or considered as mass of substance, at rates which are in the approximate ratio in which the substances occur in tobacco mosaic virus. Since the carbon-14 level varies with time of labelled carbon dioxide assimilation this relationship may be expressed in temporal terms as well. In effect, the observations show that the protein and ribonucleic acid found in the virus newly formed during the course of the isotope experiment are synthesized from their respective low molecular weight precursors at about the same time. This result, together with the preceding conclusion, means that the formation of tobacco mosaic virus in its final form is synchronized with the concurrent biosynthesis of its constituent protein and ribonucleic acid from their respective low molecular weight residues.

(4) *At least near one end of the rod tobacco mosaic virus protein and ribonucleic acid are synthesized by a*

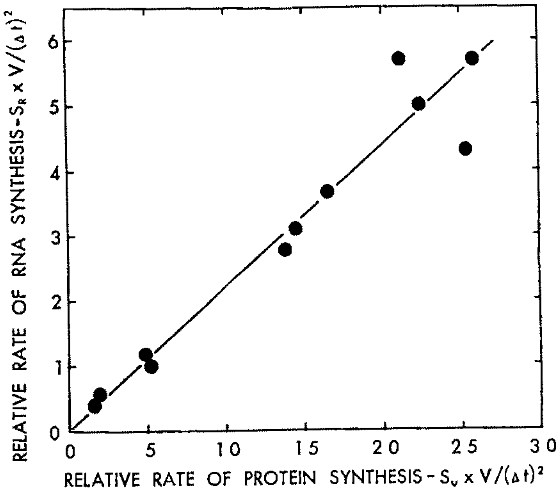

Fig. 4. Relative rates of tobacco mosaic virus protein and ribonucleic acid synthesis as determined from the respective specific activities. These data include those presented in Fig. 2, together with additional points derived from tobacco mosaic virus preparations isolated from leaves cultured under conditions different from those described in the legend for Fig. 1

process of linear extension This conclusion follows from the disproportionate distribution of carbon-14 among the protein sub-units found in successive positions along the length of the rod While the ribonucleic acid data are lacking in detail, they indicate that both virus protein and ribonucleic acid exhibit parallel linear variations in carbon-14 levels When added to the earlier results, this suggests that the ribonucleic acid and protein found in a given segment of the rod are probably synthesized concurrently from their precursors

These conclusions set certain limitations for possible mechanisms of tobacco mosaic virus replication In the following article proposed explanations of tobacco mosaic virus replication are re-examined with regard to the degree to which they conform to these requirements

The work reported in this article was supported by grants from the Rockefeller Foundation and from the National Foundation We wish to thank Mrs Ellen E Richman and Miss Clarice Strode for assistance in this work, and Dr Thomas Hollocher for suggestions regarding the treatment of kinetic data

A Re-examination of Theories

By PROF. BARRY COMMONER

THE preceding article has presented evidence, derived from isotope studies of the biosynthesis of tobacco mosaic virus, which places certain restrictions on proposals regarding the mode of replication of this virus In the present article the implications of these new requirements for the theory of tobacco mosaic virus replication are considered

Tobacco mosaic virus is a hollow cylinder composed of a single fibre of ribonucleic acid held in a helical form in the interstices between sequential turns of a helical array of ovoid protein sub-units, each of molecular weight 17,000–18,000 (ref 1) The empirical datum of replication is that infection of a suitable cell by a tobacco mosaic virus rod results in the biosynthesis of new rods which resemble the inoculum

The evidence reported in the preceding article leads to the following conclusions regarding tobacco mosaic virus biosynthesis (1) The protein and ribonucleic acid found in a given virus rod, and probably in a given linear segment of the rod, are formed concurrently from low molecular weight precursors (2) The time required to synthesize a tobacco mosaic rod is not more than about 5 min (3) The amount of unfinished virus in the leaf never exceeds about 0 1 per cent of the completed tobacco mosaic virus present (4) The disproportionate distribution of carbon-14 incorporated into ribonucleic acid and protein found in successive linear segments of the virus rod suggests that the rod is formed by a process of linear extension (5) These relationships hold for the time 88–213 hr after inoculation, a period in which most of the virus that infected tissue can produce appears in an extractable form Changes in the total rate of tobacco mosaic virus synthesis (per gm of leaf) that occur during this period reflect corresponding changes in the number of sites of tobacco mosaic virus biosynthesis, resulting from the spread of the infection among the leaf cells

Consideration of some general attributes of protein and ribonucleic acid biosynthesis adds further particulars to this specification of the spatial and temporal relationships that govern the replication of tobacco mosaic virus Comparison of isotope-levels of amino-acids and ribonucleotides found free in the infected leaf with those in the newly formed tobacco mosaic virus nucleoprotein indicate that these residues are closely related, and perhaps identical, to the precursors of virus protein and ribonucleic acid Current biochemical evidence concerning protein synthesis in general indicates that polymerization of amino-acid residues to form protein occurs in close connexion with ribonucleic acid[2] This suggests that the specific amino-acid sequence in tobacco mosaic protein is governed by the structure and nucleotide sequence of a specific ribonucleic acid In the absence of contrary data, it is simplest to assume that this ribonucleic acid is the virus ribonucleic acid

Thus, in the synchronous linear synthesis of virus ribonucleic acid and protein, the specificity of one part of the process, protein synthesis, depends on the character of the second component, ribonucleic acid However, if the matter is pursued further, we find that the biochemical competence of the virus ribonucleic acid in turn appears to depend on the virus protein

Formal evidence to support this view can be derived from the structure of tobacco mosaic virus Each tobacco mosaic virus rod contains a single fibre of ribonucleic acid A single strand of polynucleotide is incapable of maintaining a specific secondary structure Once released from the constraints imposed by the surrounding protein sub-units, the virus ribonucleic acid collapses into a random coil in which hydrogen bonds serve to bind various segments of the fibre to one another[3] Randomly coiled fibres, which comprise the greater part of ribonucleic acid preparations, are probably biologically inactive[4]

If virus ribonucleic acid is to regulate the specific sequence of amino-acids found in tobacco mosaic virus protein, it must meet two requirements (1) the ribonucleic acid fibre must be accessible to the approach of suitably activated amino-acid residues, (2) the ribonucleic acid fibre must retain a specific secondary structure, to ensure that a given region of the fibre will present a specific chemical configuration to the approaching residues

Ribonucleic acid contained within the virus rod fulfils the requirement for structural specificity but is not accessible to the approach of protein precursors On the other hand, ribonucleic acid freed from the tobacco mosaic virus rod has the necessary accessibility to metabolites, but being a single strand is subject to structural collapse and thereby fails to provide for configurational specificity

There is a possible escape from this dilemma that the germinal competence of virus ribonucleic acid is associated with a segment of the fibre which is attached to an underlying array of protein sub-units. In this condition the ribonucleic acid fibre, or at least a part of it, is both accessible and specifically structured. Such a configuration can be achieved, for example, by removing the terminal layer of protein sub-units from an end of the virus rod. This exposes the terminal turn of the ribonucleic acid fibre, which, being bound to the underlying protein sub-units, can retain its normal structural arrangement.

In this view, virus ribonucleic acid regulates the specificity of protein synthesis but can function in this way only when its own configuration is established by attachment to virus protein. The biological competence of tobacco mosaic virus would then depend mutually on protein and ribonucleic acid.

At first glance this view would appear to be disproved by the observations that ribonucleic acid preparations isolated from tobacco mosaic virus are slightly infectious, while purified preparations of tobacco mosaic virus protein are wholly inactive[5]. However, on closer examination the situation is seen to be somewhat different. While there is considerable evidence that ribonucleic acid is necessary for the infectivity of these preparations (for example, inactivation by ribonuclease), there is as yet no evidence that it is *alone* sufficient for biological activity. The infectivity-levels of isolated ribonucleic acid preparations are two orders of magnitude less than those exhibited by either natural tobacco mosaic virus nucleoprotein, or by reconstituted nucleoprotein. Ribonucleic acid preparations are heterogeneous by several criteria, the major part of the infectivity being associated with a component that represents about 1–10 per cent of the ribonucleic acid present[4]. Takahashi *et al.*[6] find that the most infectious electrophoretic fractions of ribonucleic acid preparations also contain the greatest amounts of associated protein. If it is assumed that in a ribonucleic acid preparation only those fibres which are associated with some protein are biologically active, the protein content of such preparations is sufficient to account for the presence of 4–50 protein sub-units per active ribonucleic acid strand[7]. It can be shown also that the low infectivity of ribonucleic acid preparations is not due to inefficient invasiveness resulting from susceptibility to degradative enzymes. Reconstitution, which restores the proper ribonucleic acid configuration, contributes directly to infectivity rather than simply protecting the inherent activity of the ribonucleic acid from inactivation during invasion[8]. Furthermore, when part of the virus protein is removed, so that the ribonucleic acid fibre becomes susceptible to enzymatic attack *in vitro*, the rod retains a relatively high level of infectivity[9].

The available evidence suggests that virus ribonucleic acid, like tobacco mosaic virus protein, is a necessary but not sufficient condition for virus activity. At the least, there is in these data no commanding reason to preclude the proposal that the biological activity of tobacco mosaic virus, or of infectious materials derived from it, depends jointly on the presence of intact fibres of ribonucleic acid, and at least a few protein sub-units.

These considerations may be summarized as follows: (*a*) the experimental data on biosynthesis show that tobacco mosaic virus formation involves the synchronous extension of the virus ribonucleic acid fibre and of its helical array of protein sub-units; (*b*) the structural properties of tobacco mosaic virus and its constituents suggest that replication requires the specific participation of both virus ribonucleic acid and protein.

These conclusions preclude any proposal regarding tobacco mosaic virus replication that requires asynchrony greater than a few minutes between the synthesis of ribonucleic acid and protein found in a given virus rod, or the accumulation of unassembled virus parts in amounts which are significant relative to the tissue's content of completed virus. A recent proposal of this type based on determination of the biological activity of differential extracts of infected leaf is that a store of infectious ribonucleic acid accumulates 10–50 hr. after inoculation, being later depleted as virus protein is synthesized and condensed around the ribonucleic acid fibres[9]. The isotope data described in the preceding article show that a replicative process of this type cannot account for the tobacco mosaic virus produced 88–213 hr. after inoculation, when the greater part of the virus appears in tissue extracts. It is possible that two different types of replication occur, the earlier one being governed by asynchronous synthesis of virus ribonucleic acid and protein. Isotope data on this phase of the virus growth curve, which are not available as yet, may help to resolve the discrepancy.

An alternative type of replicative scheme, proposed in a preliminary form in an earlier publication[10], conforms more closely to the requirements discussed above. This scheme is not complete, and does not describe the initial phases of the replication process, that is, the events initiated in the cell by the entering inoculum. Rather, the scheme relates only to those phases of replication in which the bulk of the virus found in infected leaf is synthesized from low molecular weight precursors.

This scheme proposes that in tobacco mosaic virus replication the germinal agent may be represented by a single turn of the virus ribonucleic acid fibre attached to a layer of protein sub-units. This structure becomes accessible when a terminal layer of protein units is removed from one end of the tobacco mosaic virus rod, a process which might represent the first step in infection. Where infection is induced by a ribonucleic acid preparation, the agent of infection might be represented by a terminal segment of a ribonucleic acid fibre which remains attached to several protein sub-units, thereby providing an arrangement similar to that found at the exposed end of a tobacco mosaic virus rod.

Fig. 5*A* is a schematic representation of such a structure. It shows a single turn of the ribonucleic acid helix, comprising 48 nucleotides, attached to the surface of the 16 1/3 protein sub-units which also comprise a single turn. In this arrangement the structural configuration of the ribonucleic acid fibre is determined by its attachment to the surfaces of the protein sub-units.

Fig. 5*B* represents the second phase of the proposed process, in which amino-acid residues in an appropriately activated form become attached to the exposed segment of ribonucleic acid. It is presumed that the sequence of amino-acids bound to the ribonucleic acid segment will depend on the nucleotide sequence in the segment, and on its configuration. The diameter of the ribonucleic acid helix is about 80 A., and the contour length of a single turn is about 250 A. A polypeptide chain in the configuration of an α-helix has an axial translation of 1.5 A. per residue, so that a helix 250 A.

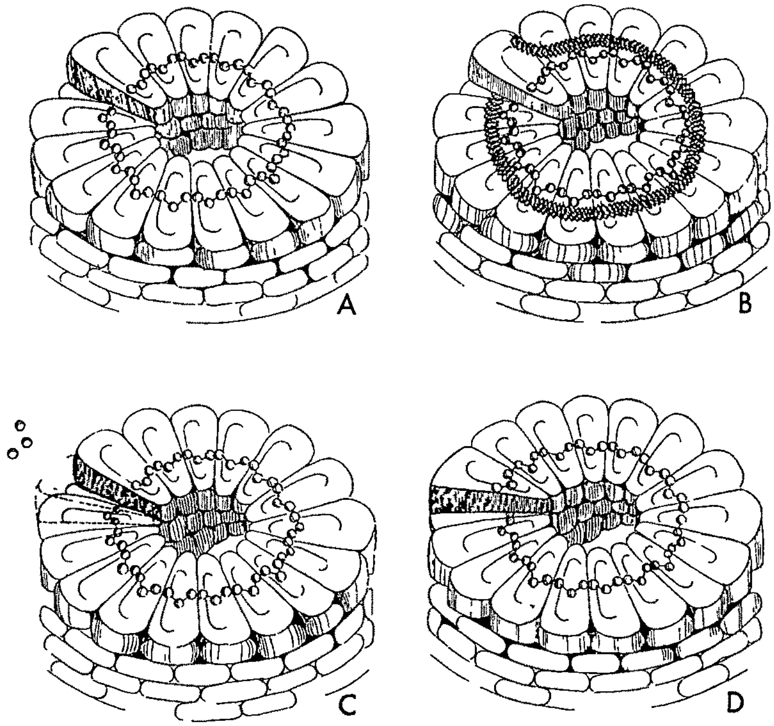

Fig. 5. Drawings to illustrate successive stages in the scheme of biosynthesis of tobacco mosaic virus proposed in the text. The view represents the end of a tobacco mosaic virus rod in process of formation. Sectional segments represent protein sub-units, small spheres represent the ribonucleotide residues, and the helical structure in *B* represents the polypeptide chain of a single protein sub-unit in the configuration of an α-helix. The drawings are schematic and only approximately to scale. Indications of surface structure on the protein sub-units are wholly arbitrary.

long overall will contain about 167 residues[11]. Hence a single turn of the virus ribonucleic acid fibre will accommodate a polypeptide α-helix comprising about 167 amino-acid residues. This is the approximate size of the polypeptide unit contained in a single virus protein sub-unit. It is proposed, then, that a single turn of the virus ribonucleic acid fibre provides the locus for the initial polymerization of the amino-acids found in a single virus protein sub-unit.

Fig. 5*C* illustrates the results of the next stage in the proposed scheme, in which the newly formed polypeptide chain becomes detached from the ribonucleic acid fibre and, after suitable folding, assumes the tertiary configuration characteristic of the virus protein sub-unit. It will be noted that the terminal sub-unit represents a step dislocation in the crystal-like array of protein sub-units[12]. It is proposed that the newly formed sub-unit takes its place at the step dislocation, thereby extending the helical array by an additional member. The newly formed sub-unit becomes the terminal unit in the rod, but unlike the other units is not, at first, associated with attached ribonucleic acid. Furthermore, as it falls into place the new sub-unit covers the three proximal nucleotides of the terminal ribonucleic acid segment.

It is proposed, next, that the ribonucleic acid chain is extended by the terminal acquisition of three new nucleotides. These become added to the ribonucleic acid fibre and, being bound to the free surface of the last-formed protein sub-unit, assume the appropriate structural configuration. In this manner the terminal exposed section of the ribonucleic acid fibre is restored to its full complement of 48 nucleotides (see Fig. 5*D*).

Comparison of Figs. 5*A* and 5*D* shows the overall result of the proposed process: both the ribonucleic acid fibre and the helical array of protein sub-units have been extended lengthwise by synchronous synthesis from amino-acid and nucleotide residues. Repetition of this process accomplishes a progressive lengthening of the virus rod. The process is, however, not a uniformly repetitive event. The synthesis of each new protein sub-unit and the subsequent extension of the terminal ribonucleic acid segment causes a change in the nucleotide composition of the exposed ribonucleic acid segment. In each replicative event this segment loses three nucleotides at one end, and gains three nucleotides at the other end. Thus, the formation of each protein sub-unit alters, slightly, the nucleotide sequence of the segment of ribonucleic acid which governs the synthesis of the next protein sub-unit. This change might, for example, be reflected in a slight variation of the amino-acid sequence in the next protein sub-unit that is formed. In turn, the altered structure of the newly formed protein sub-unit might influence the choice of the new nucleotides that become attached to its surface when the ribonucleic acid fibre is extended. Such a cyclical interaction between successive biosynthesis of protein sub-units and of extension of the ribonucleic acid fibre could result in a gradual and harmonic variation in the composition of both components. One result of this process may be the appearance of periodic weak points which disrupt the extension of the virus rod, thereby detaching tobacco mosaic virus rods of a given length.

The foregoing scheme provides for the simultaneous synthesis of virus ribonucleic acid and protein from low molecular weight residues. It proposes a linear extension of both the ribonucleic acid and protein parts of the virus. In these respects it provides a model which is in keeping with the experimental observations on the biosynthesis of tobacco mosaic virus protein and ribonucleic acid described in the preceding article.

Certain features of the proposed mechanism may be of interest apart from their possible applicability to tobacco mosaic virus replication. Most proposals regarding the mechanism of nucleic acid replication, especially those derived from the proposed double-helical structure of deoxyribonucleic acid[13], have two chief distinguishing features. (1) Replication is conceived to occur in a mode which is lateral to the nucleic acid fibre, the ordering of new nucleotide residues being accomplished by forces, extended in a lateral direction, which lead to the establishment of specific hydrogen bonds[14]. (2) The nucleic acid is supposed to be a self-sufficient agent, neither protein nor any other genetically specific substance being required for the replicative process Configurational specificity is inherent in the double-stranded structure, which unlike a single polynucleotide fibre can maintain a rigid geometrical arrangement This structure is itself a hindrance to the accessibility toward approaching nucleotide residues that is a necessary prelude to replication, and various hypothetical schemes have been put forward to permit such access without undue loss of configurational stability[14]

The general features of the replicative scheme described in Fig 5 contrast with the above (1) The ribonucleic acid fibre is single, and is therefore not capable of achieving a specific configuration apart from association with protein (2) Replication of the ribonucleic acid fibre is viewed as a linear process Duplication of the original fibre's nucleotide sequence is not accomplished by direct lateral complementarity, but by the instigation of the required pattern of selection of new terminal nucleotides (3) Replication of the ribonucleic acid fibre is not a self-sufficient property of ribonucleic acid itself, but depends on the participation of protein This requirement emerges directly from the single-stranded character of the ribonucleic acid fibre It also results from the need for a mechanism which can provide for specific selection of terminal nucleotides

In the proposed scheme for linear replication of tobacco mosaic virus specific nucleotide selection may be provided as follows The protein sub-unit acquires an amino-acid sequence which reflects the nucleotide sequence of a given segment of ribonucleic acid The sub-unit's tertiary configuration, we may assume, is in turn dependent on this amino-acid sequence, so that the surface properties of the sub-unit are indirectly determined by the nucleotide sequence in the ribonucleic acid segment Finally, the specific properties of the protein sub-unit surface are the means for determining the identity and sequence of the three new nucleotides added to the ribonucleic acid fibre. Hence, in this view the sequence of forty-eight nucleotides in the terminal segment of the ribonucleic acid fibre determines the sequence of three nucleotides added to the free end of the segment; but in this determination the protein sub-unit serves as a genetically specific, and essential, intermediate. From information theory it should be possible to derive suitable quantitative rules for the determinative properties of such a system

This type of replicative scheme is specifically adapted to the participation of a single-stranded polynucleotide In this connexion its applicability to the single-stranded form of deoxyribonucleic acid recently discovered in a bacteriophage[15] may be of interest

The foregoing scheme may be cast in alternative forms. One such form[7] proposes that the protein sub-unit by analogy with the reading head of a tape recorder "serves as a movable unit which 'reads' or develops the structure of the otherwise structureless ribonucleic acid as it becomes associated with successive portions along the length of the nucleic acid chain"

The proposed scheme offers a possible explanation for the relationships between the amounts of ribonucleic acid and protein in tobacco mosaic virus The virus rod contains a ribonucleic acid fibre made of about 6,000 nucleotide residues and about 2,000 protein sub-units If it is assumed that all the protein sub-units are wholly identical with respect to amino-acid sequence, then the replicative information required to specify the whole protein structure of tobacco mosaic virus relates only to the number of amino-acid residues in a single sub-unit—about 150 Clearly the 6,000 nucleotide sequence of the total ribonucleic acid fibre is an excessively complex source of determinative information for this purpose On the other hand, if each protein sub-unit were unique with regard to amino-acid sequence the nucleotide sequence in a single ribonucleic acid fibre would be insufficient to serve as a determinative agent for the entire assemblage of 2,000 sub-units Reality may lie somewhere between these two extremes , that is, protein sub-units have a considerable part of their amino-acid sequences in common, but differ in some respects This condition is consistent with the scheme described in Fig 5

The foregoing discussion shows that both the new results on the course of tobacco mosaic virus biosynthesis, and consideration of the relation between the structure of tobacco mosaic virus and the formal requirements of replication, place similar restrictions on theories of replication The major requirement is that in tobacco mosaic virus replication biosynthesis of virus protein and ribonucleic acid, and formation of their specific structural arrangement in the virus rod, proceed in synchrony A formal consideration of the geometry of the tobacco mosaic virus rod shows that there is no way of meeting this requirement other than by means of linear extension of the tobacco mosaic virus rod Linear analysis of isotope distribution within the rod offers the first direct experimental evidence that tobacco mosaic virus biosynthesis may proceed in this fashion However, these results, like those which tend to support alternative schemes, are insufficiently detailed or decisive to establish a specific explanation of the mechanism of tobacco mosaic virus replication It is to be hoped that the more detailed requirements which can now be placed on proposed mechanisms of tobacco mosaic virus replication will suggest new experiments which may provide evidence that favours decisively one proposal or another

The preparation of this and the preceding article has had the benefit of valuable discussions with Dr Alfred M Holtzer I wish to acknowledge also the support of grants from the National Foundation and the Rockefeller Foundation

APPOINTMENTS VACANT

Applications are invited for the following appointments on or before the dates mentioned

Lecturer (with a good honours degree and preferably some teaching experience) in Mathematics, and a Lecturer or Assistant Lecturer (with a good honours degree and preferably some teaching experience) in Physics at the Royal Technical College of East Africa, Nairobi—The Council for Overseas Colleges, 12 Lincoln's Inn Fields, London, W C 2 (January 5)

Lecturer in the Department of Biological Chemistry—The Secretary, The University, Aberdeen (January 8)

Lecturer in the Department of Physics—The Deputy Registrar, The University, Edgbaston, Birmingham 15 (January 12)

Chair of Chemistry—The Registrar, University College of Wales, Aberystwyth (January 16)

Laboratory Technician (with experience in bacteriology or virology)—The Director, Animal Health Trust Canine Health Centre, Kennett, Near Newmarket (January 18)

Biologist (with a pass degree in a biological subject or equivalent) for work on plant virus diseases—The Secretary, Glasshouse Crops Research Institute, Worthing Road, Rustington, Littlehampton, Sussex (January 20)

Lecturer/Senior Lecturer in Nutrition at the University of New England, Australia, to undertake teaching and research in livestock nutrition in the Department of Nutrition and Chemical Pathology—The Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W C 1 (Australia January 20)

Lecturer (Grade II) in Pure Mathematics—The Registrar, The University Bristol 8 (January 25)

Lecturer in Mechanical Engineering at the University of Canterbury, New Zealand—The Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W C 1 (New Zealand, January 31)

Lecturer or Assistant Lecturer in Parasitology at the University of Malaya (Singapore Division)—The Secretary, Inter-University Council for Higher Education Overseas, 29 Woburn Square, London, W C 1 (January 31)

Lecturer (with a degree in mechanical engineering of a recognized university, teaching experience at a university, or have held a responsible position in a branch of mechanical engineering) in Mechanical Engineering at the University of Canterbury, New Zealand—The Secretary Association of Universities of the British Commonwealth, 36 Gordon Square, London, W C 1 (New Zealand, January 31)

Visiting Professor of Oceanography at the University of Cape Town, South Africa—The Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W C 1 (South Africa, January 31)

Imperial Chemical Industries Research Fellows in Physics, Chemistry, Biochemistry, Engineering, Metallurgy and Pharmacology or any related subjects—The Registrar, The University, Liverpool (February 13)

Lecturer or Assistant Lecturer in Pure Mathematics—The Secretary and Registrar, The University, Southampton (February 15)

Lecturer or Assistant Lecturer (with a first-class degree in mathematics, a strong interest in research in some field of applied mathematics, and preferably experience of teaching mathematics to engineers or scientists or of applying it to engineering design) in Applied Mathematics—The Secretary and Registrar, The University, Southampton (February 15)

Lecturer or Assistant Lecturer (with a good degree in electrical (power) engineering) in Electrical Engineering—The Secretary and Registrar, The University, Southampton (February 15)

Imperial Chemical Industries Research Fellows in Biochemistry, Chemistry, Engineering, Pharmacology, Physics, or Chemical Technology (Chemical Engineering)—The Secretary, The University, Edinburgh (February 16)

Professor of Inorganic Chemistry—The Registrar, University Registry, Oxford (February 18)

Reader (or Lecturer) in Sociology—The Registrar, University Registry, Oxford (February 18)

University Tutor (medical graduate) in Physiology—The Secretary, The Queen's University, Belfast (February 20)

Imperial Chemical Industries Research Fellows in Chemistry, Biochemistry, Physics, Engineering, Chemotherapy and related subjects—The Secretary, Academic Council, Queen's University, Belfast (March 1)

Imperial Chemical Industry Research Fellows in Biochemistry, Chemistry or Physics—The Registrar, University College, Dublin (March 7)

Assistants, Grade "A" and "B" at Crawley College of Further Education to teach Chemistry to "O" and "A" levels—The Director of Education, County Hall, Chichester

Lecturer (graduate physical chemist or metallurgist) in Extraction Metallurgy—Prof F D Richardson Department of Metallurgy, Imperial College of Science and Technology, Prince Consort Road, London, S W 7

Senior Lecturer and a Lecturer (with an honours degree and/or professional qualifications, with teaching as well as industrial or research experience) in Mechanical Engineering—The Principal, Brunel College of Technology, Woodlands Avenue, Acton, London, W 3

Technician or Senior Technician in the Zoology Department—The Secretary, Royal Holloway College (University of London), Englefield Green, Surrey

REPORTS and other PUBLICATIONS

(not included in the monthly Books Supplement)

Great Britain and Ireland

The Ferns and Fern-Allies of West Tropical Africa By the late A H G Alston (Being a Supplement to the Second Edition of the "Flora of West Tropical Africa") Pp vii+89 (London Crown Agents for Oversea Governments and Administrations, 1959) 7*s* 6*d* [411

Cambrian Forests Edited by H L Edlin (Forestry Commission Guide) Pp vi+104+16 plates (London H M. Stationery Office, 1959) 5*s* net [411

Field Studies, Vol 1, No 1 (May 1959) Pp i+142+8 plates (London Field Studies Council, 1959 Copies obtainable from The Publicity Secretary, Field Studies Council, Ravensmead, Keston, Kent) 5*s* [411

Studies in Crystal Physics By Dr M A Jaswon (Original Papers and Papers Reprinted from *Research*, Vol 11, 1958) Pp iv+42 (London Butterworths Scientific Publications, 1959) 10*s* 6*d* [411

Calouste Gulbenkian Foundation Report of the Accountancy Checking Commission relating to the year 1958 (Translated from the Portuguese) Pp 30 (London Calouste Gulbenkian Foundation, United Kingdom and British Commonwealth Branch, 1959) [411

Other Countries

Norsk Polarinstitutt Meddelelse Nr 82 Harald Ulrik Sverdrup, 15 November 1888–21 August 1957 Av J E Fjeldstad Pp 19 (Oslo Norsk Polarinstitutt 1959) Kr 2 50 [3010

United States Department of Agriculture Agricultural Research Service Technical Bulletin No 201 The Fruit-Piercing Moth of the Genus *Gonodontha* Hubner (Lepidoptera, Noctuidae) By E L Todd Pp 52+12 plates (Washington, D C Government Printing Office 1959) 35 cents [3010

British Guiana Report on the Geological Survey Department for the year 1958 Pp 56 (Georgetown Geological Survey of British Guiana 1959) 1 dollar [3010

Institute of Medical Research, Malaya Bulletin No 9 Notes on the Treponematoses, with an illustrated account of Yaws By L H Turner Pp xxiii+278 (30 plates) (Kuala Lumpur Caxton Stationers, Ltd, London Crown Agents for Oversea Governments and Administrations, 1959) 9 Malayan dollars [3010

World Health Organization Technical Report Series No 173 Methods of Radiochemical Analysis—Report of a Joint WHO/FAO Expert Committee Pp 116 (Geneva World Health Organization, London H M Stationery Office, 1959) 3 Swiss francs, 5*s*, 1 dollar [3010

Food and Agriculture Organization of the United Nations Indo-Pacific Fisheries Council—Proceedings, 7th Session, Bandung, Indonesia, 13-27 May 1957 Section 1 Pp ii+153 (Bangkok IPFC Secretariat, FAO Regional Office for Asia and the Far East, 1959) [3010

Berichte des Deutschen Wetterdienstes Nr 56 (Band 8) Ein Thermoelektrisch Gerefeltes Frigorimeter zur Wirkungsbezogenen Messung der Meteorologischen Umweltbedingungen in der Landwirtschaft Von Erwin King Pp 32 (Offenbach a M Deutschen Wetterdienstes, 1959) [3010

Publications de l'Institut National pour l'Étude Agronomique du Congo Belge Bulletin Climatologique Annuel du Congo Belge et du Ruanda-Urundi, Année 1958 Pp 189 (Bureau Climatologique—Communication No 18) (Bruxelles Institut National pour l'Étude Agronomique du Congo Belge, 1959) [3010

British Guiana Geological Survey Department Mineral Resources Pamphlet No 8 Report on British Guiana White Sand as a Possible Source of Glass Sand By R A Dujardin Pp 14+4 figures (Georgetown Geological Survey of British Guiana, 1959) 25 cents [3010

Conseil Permanent International pour l'Exploration de la Mer, Charlottenlund-Slot, Danemark Bulletin Hydrographique pour l'Année 1954 Publié par le Bureau du Conseil, Service Hydrographique Pp x+184 (Copenhague Andr Fred Høst et Fils, 1959) Kr 55 [3010

Mitteilungen des Deutschen Wetterdienstes, Nr 17 (Band 3) Advektivfrost und Strahlungsfrost Von Albrecht Vaupel (Musterbeispiele aus der Frostschadenskartierung 1957 im Weinbau des Landes Rheinland-Pfalz, durchgeführt von der Agrarmeteorologischen Versuchs- und Beratungsstelle Neustadt a d Weinstrasse) Pp 31 (Offenbach a M Deutschen Wetterdienstes, 1959) [411

Bulletin of the American Museum of Natural History Vol 118, Article 6 A Revision of *Glaucina*, *Synglochis*, and *Eubarnesia* (Lepidoptera, Geometridae) By Frederick H Rindge Pp 259–366+plates 23–27 (New York American Museum of Natural History, 1959) 2 dollars [411

Biologischen Bundesanstalt fur Land- und Fortswirtschaft, Berlin-Dahlem Mitteilungen Heft 95 (März, 1959) Zur Toxikologie der Insektizide Literaturubersicht 1 Teil Dien-Gruppe Von Dr P Steiner und Dr W Gruch Pp 118 9 70 D M Heft 96 (Mai, 1959) Biologische Untersuchungen uber die Entwicklung von *Hylotrupes bajulus* L (Hausbockkäfer) Von Dr A Korting Pp 35 3 60 D M Bibliographie der Pflanzenschutzliteratur, 1952 (Bibliography of Plant Protection, 1952) Bearbeitet von Dr J Bärner Pp xii+433 43 D M (Berlin-Dahlem Biologische Bundesanstalt fur Land- und Forstwirtschaft, 1959) [411

INDEX

References to B A pagination indicate the issue for September 5, 1959

ABAELU, J N (Moore, Dr A W, and) Non-Symbiotic Nitrogen Fixation in a Soil of the Nigerian Rain-Forest Zone, 75
Abdel Moneim, F, and others *In vitro* Study of the Anthelminthic Property of *Artemesia monosperma* grown in Egypt, 647
Abdel-Samie, Y, and others Production of Serum Albumin and of Globulins by Chick Mesenchymal Tissue and by HeLa Tumour Tissue in Culture, 361, *erratum*, 943
Abe, Matazo, and others Microbiological Transformation of a Cardiac Aglycone, 469
Abel, Dr E W Lectureship in inorganic chemistry in the University of Bristol conferred on, 410
Abelson, Philip H (edited by) Researches in Geochemistry, *review* by Dr S R Nockolds, 1757
Abercrombie, Michael Title of professor of embryology in the University of London (at University College) conferred on, 1451
Åberg, Prof B, and others Fate of Injected Dextran Labelled with Tritium in Mice, 373
Abnormal Haemoglobin (New Fast), in Newborn Nigerians (Dr A E Boyo and R G Hendrickse), 997
Abnormal Haemoglobins—a Symposium organized by the Council for International Organizations of Medical Sciences (edited by J H P Jonxis Delafresnaye), *review* by Dr J A M Ager, 840
Abnormal Human Haemoglobins—Human Haemoglobin E, the Chemical Effect of Gene Mutation (Dr J A Hunt and Dr V M Ingram), 870, Haemoglobin 'Bart's', a Foetal Haemoglobin without α-Chains (Dr J A Hunt and Dr H Lehmann), 872
Abnormalities (Floral), in Broccoli (D R Sampson and M MacArthur), 682
Abnormality (A Chemical), in Haemoglobin G (Dr Robert L Hill and Dr Herbert C Schwartz), 641
Abo Blood Groups and Fertility in a Normal American Population An Association between (Dr T Edward Reed and Dr J H Ahronheim), 611
Abolition by Chlorpromazine of the Inhibiting Effect of Iproniazid on the Depletion of Adrenal Catechol Amines induced by Reserpine (F Camanni, Dr G M Molinatti and M Olivetti), B A 65
Abood, L G, and Koketsu, K Excitability and Phosphorylation of Muscle and Nerve in Sodium-free Hydrazinium Solution, 725
Abortion (Ovine), due to Toxoplasmosis (Dr J K A Beverley and W A Watson), 2041
Abragam, Prof A Spin Temperature (Holweck Lecture of the Physical Society), 954
Abrahamson, E W Fast Chemical Reactions in Solution (Visual Pigments), 1453
Abrasion of Solids such as Metals A Theory of the (J Goddard H J Harker and H Wilman), 333
Abreu, Luiz A, and Abreu, R Raposo Determination of Tissue Mucoproteins, 2016
Abreu, R Raposo (Abreu, Luiz A, and) Determination of Tissue Mucoproteins, 2016
Abrogation by Injected Mouse Blood of Protective Effect of Foreign Bone Marrow in Lethally X-Irradiated Mice (L J Cole and R M Garver), 1815
Absence of Craters on the Far Side of the Moon (David B Beard), 1631
Absence of Ectodermal Ridge Limb Development in the (Dr Eugene Bell, Dr John W Saunders, jun, and Dr Edgar Zwilling), 1736
Absence of Metabolic Energy Supply Maintenance of Semipermeability of Plant Cell Membranes in the (Dr B Ginzburg), 1073
Absence of Serum Factor Transformation Reaction of Pneumococci in the (Prof Takeshi Odaka and Tadashi Watanabe), 471
Absence (Hereditary), of the Spleen in the Mouse (A G Searle), 1419
Absolute Requirement for 'Iron Transport Factors' by *Microbacterium lacticum* 8181 (Dr D Hendlin and Dr A L Demain), 1894
Absolute Scale of Time (Sir John Carroll), 260
Absorbancy Measurements on Liver and Kidney Cells (Localization and Assay of Respiratory Enzymes in Single Living Cells), (Dr Bo Thorell and Prof Britton Chance), 934
Absorbancy Measurements on the *Neberkern* (Localization and Assay of Respiratory Enzymes in Single Living Cells), (Dr Robert P Perry, Dr Bo Thorell, Dr Lennart Åkerman and Prof Britton Chance), 929
Absorption of Atmospheric Moisture by Freeze-dried Pork and Fish (Norman A Matheson), 1949
Absorption of Magnesium in the Large Intestine of the Calf (Dr R H Smith), 821
Absorption of Zinc Phosphide Particles (Dr A S Curry, Dr D E Price and Dr F G Tryhorn), 642
Absorption (Dieletric), in Dispersed Systems (G A Johnson and Dr S A Neale), 898
Absorption (Subcutaneous), of Urethane in Dehydrated and Fasted Mice (Eig Il Hvidberg and Jens Schou), 646
Absorption (Ultrasonic), in Acetic Acid at 450 kc /s by the Calorimetric Method (S Parthasarathy and V N Bindal), 631
Absorption (Ultra-violet), of Deoxyribo- or Ribo-Nucleic Acids Comparative Effects of Heat on Chromatography and (Dr Saul Kit), 36
Absorption (Vitamin B_{12}), in the Rat Effect of Ethylenediamine Tetraacetate on (Edward G Rice, Dr Samuel M Greenberg, John F Herndon and E J Van Loon) 1948
Absorption Bands (Infra-red) The Intensity of—a Bibliography (compiled by Dr R G Gillis), 682
Absorption Cells (Polyethylene), for Infra-Red Spectrophotometry (Trevor Robinson), 448
Absorption Maxima (Ultra-Violet), and the Electronegativity of the Adjacent Atoms in some Aliphatic Carbonyl Compounds A Correlation between the Shift in the (Dr P Borrell), 1932
Absorption Spectra (Visible), of Copper-ethylene-diamine-*bis* (acetylacetone) in the Crystalline State (Animesh Chakravorty and Dr Sadhan Basu) 50
Absorption Spectroscopy (Atomic) Determination of Magnesium in Blood Serum by (Dr J B Willis), 186
Absorption Spectrum of Flavin Adenine Dinucleotide Change of, by its Binding with both D-Amino Acid Oxidase Apo-Protein and Benzoate (Dr Kunio Yagi, Takayuki Ozawa and Minoru Harada), 1938
Absorption Spectrum (Red-Shift), of the Cygnus-*A* Radio Source (Dr R D Davies and Dr R C Jennison), 803
Abstract Algebra (Modern) Selections from (Richard V Andree), *review* by Prof T A A Broadbent, 301
Abyssal Priapulid *Priapulus abyssorum*, New Species, the first (Robert J Menzies), 1585
Acacia Pollen of, from Tufaceous Limestone near Udaipur (T Trivedi), 123
Acacia Species Occurrence of 4-Hydroxypipecolic Acid in (Dr J W Clark-Lewis and P I Mortimer), 1234
Academy of Sciences of the U S S R Publication in the Russian language of *High Molecular Compounds*, *The Geology of Ore Deposits*, *Palaeontological Journal*, *Radiochemistry*, *The Physics of the Solid Body*, *Cytology*, and *Soviet Slavic Studies*, 410
Academy of Sciences of the U S S R (Committee on Geodesy and Geophysics) Report on recent work in the Soviet Union in the field of Seismology, 322
Academy of Sciences of the U S S R (United States National Academy of Sciences and the) Exchange visits by research scientists of each country, 680
Acanthocottus lilljeborgi (Collett) in British Seas (P J Miller), 1162
Acari Mites or the (T E Hughes), *review* by G O Evans, 1677
Accelerator (Proton Linear), at the Rutherford High Energy Laboratory, 94
Accessory Pigments (Photosynthetically Active), of Cryptomonads (Photoreactive Pigments in Flagellates), (Dr F T Haxo and D C Fork), 1051
Accident at Windscale Accumulation of Radioactive Iodine in Thyroid Glands subsequent to Nuclear Weapon Tests and the (Dr Hamish A Robertson and Ian R Falconer), 1699
Accident (Nuclear Reactor *RB*), in Yugoslavia, 406
Accretion Coast Erosion and (British Association for the Advancement of Science, Sections E (Geography) and K (Botany), Discussion on), 499
Accumulation of Dextran in Human Red Cells after Haemolysis (N V B Marsden and S G Ostling), 723
Accumulation of Radioactive Iodine in Thyroid Glands subsequent to Nuclear Weapon Tests and the Accident at Windscale (Dr Hamish A Robertson and Ian R Falconer), 1699
Accurate Measurement An Image-Splitting Microscope for (J Dyson), 1561
Acer saccharinum L Formation of Allantoin and Allantoic Acid from Adenine in Leaves of (Robert N Barnes), 1944
Acetate (Cellulose) Cross-linking of, by Ionizing Radiation (Dr S H Pinner, T T Greenwood and D G Lloyd), 1303
Acetate (*p*-Nitrophenyl) Catalysed by Chymotrypsin Reactivity and Interrelationship of Intermediates in the Hydrolysis of (Mario A Marini and Prof George P Hess) 113
Acetate (Polyvinyl) Gas Chromatographic Separation of Long-chain Fatty Acid Methyl Esters on (Irwin Hornstein, L E Elliott and P F Crowe), 1710
    Separation of Polyvinyl Chloride and, by Chromatographic Methods (W J Langford and D J Vaughan), 116
Acetic Acid Ultrasonic Absorption in, at 450 kc /s by the Calorimetric Method (S Parthasarathy and V N Bindal), 631
Acetic Acid (Indole), and α-Naphthalene Acetic Acid Effect of, on the Growth, Flowering and Fruit Set in Sweet Potato (G Satyanarayana and Dr G Rangaswami), B A 73
Acetic Acid (3-Indole), in *Avena* Electrical Determination of Transport of (L A Newman), 1728
Acetic Acid (α-Naphthalene) Effect of Indole Acetic Acid and, on the Growth, Flowering and Fruit Set in Sweet Potato (G Satyanarayana and Dr G Rangaswami), B A 73
2-Acetoamido-2-Deoxy-α-D-Glucopyranoside (Methyl) *N*-Methylation of (Dr S A Barker, Prof M Stacey and Dr D J Tipper), 1718

INDEX

Acetone Combined Use of Polymyxin and, to obtain Cell-free Enzymes (J R Villaneuva), 1565
Acetone-Hydrochloric Acid Reaction of Formyl Porphyrins with (Dr P S Clezy), 1142
Acetophenetidin (Prof Paul K Smith), *review* by Dr Marthe Vogt, 1349
16-Acetyl Digitalinum Verum Chemistry and Pharmacology of (Z Kanda, Prof A Sekiya, K Katayama, A Okano and T Miki), 1414
Acetylase (Choline) Action of Ganglion Blocking Drugs on (Dr J E Gardiner), B A 71
Acetylcholine Effect of, on the Incorporation of Radiophosphorus into the Phosphatido-Peptide Fraction of Pancreas Slices (Prof C G Huggins), 1412
  Effect of Pempidine on the *in vitro* Synthesis of (Joan Parkinson), 554
  Reversal by, of the Inhibition by Thyroxine of Oxidative Phosphorylation in Guinea Pig Heart Sarcosomes (Heitor Medina and Metry Bacila), 1066
Acetylcholine and Eserine Effect of, on the Spawning of *Hydractinia echinata* (M Yoshida), 1151
Acetylcholinesterase (Blood), in *Phalaris* Staggers (Dr D J Walker), 1411
N-Acetylneuraminic Acid in *Escherichia coli* *N*,O-Diacetylneuraminic Acid in (Dr C W De Witt and J A Rowe), 381
Acheson, Fiona, and Fry, Dr R J M Induced Tolerance to D-Tubocurarine Chloride in the Cat, 1409
Achievements Some International Geophysical Year (Royal Society), 604
Acid Phosphatases (Pituitary), *in vitro* Effects of Methylthiouracil or Thyroidectomy on Activation of, by Whole Hypothalamic Extract (Dr V Schreiber and Dr V Kmentova), 728
Acid Strength of Propionate Side-Chains of Haematin Decrease in, on Reduction to Haem (Dr J E O'Hagan), 1808
Acid-fast Bacilli Difference between the Catalases of (Wieslaw Tysarowski and Stanislaw Kwiek), 1513
Acid-Schiff-Positive Material (Periodic), and Alkaline Phosphatase in the Uterine Wall of the Pig during the Sexual Cycle (Rolv Austad and Dr Otto Garm), 999
Acid-Secretion (Defensive), in some Marine Gastropods (Dr T E Thompson), 1162
Acid and Alkaline Phosphatase Visualization of, after Starch-Gel Electrophoresis of Seminal Plasma, Serum and Bile (Dr Bengt Estborn), 1636
Acidified Rat Serum Peptides with Oxytocic and Pressor Activity obtained from (Prof H Croxatto, T Pereda and R Mellada), 1496
Acids (Krebs Cycle) Oxidation of, by Apple Tissue (M D Hatch, J A Pearson, A Millerd and R N Robertson), 506
Acids (Organic) Two-Dimensional High-Voltage Paper Electrophoresis of Amino- and other (Dr D Gross), 1298
Acids (The Organic), in Rose Hips (Dr G A D Jackson and S E Y Barakat), 1953
Acids (Trans-Unsaturated), in the Depot Fat of Ruminants and Non-Ruminants (L Hartman and Dr F B Shorland), 2024
Acoustics International Congress on (Prof E G Richardson), 1031
Acoustique Musicale (Colloques Internationaux du Centre National de la Recherche Scientifique, No 84, Marseilles 1959), *review* by Prof E G Richardson, 1902
Acousto-Electric Effect Experiments on the (Piroska Smith (*née* Vermes) and D O Sproule), 264
Acquired Immunity The Clonal Selection Theory of (Sir Macfarlane Burnet), *review* by Dr J H Humphrey, 753
Acquired Resistance to Experimental 'Allergic' Encephalomyelitis Various Types of (G J Svet-Moldavsky, I A Svet-Moldavskaya and L I Raffkina), 1552
Acraniate Larvae Ecology of (J H Wickstead and Quentin Bone), 1849
Acres, G J K, and Dalton, F L A Capacitance Method for following Vinyl Polymerizations initiated by γ-Rays, 335
Acridine Dye Aggregation of an, on Native and Denatured Deoxyribonucleates (Dr D F Bradley and Dr G Felsenfeld), 1920
Actinomycin Synthesis Inhibition of, by D-Valine (Prof Edward Katz), 1666
Action Plant-Growth Substances and the Copper Chelating Theory of their (Dr C H Fawcett), 796
Action of Anhydrous Formic Acid on Peptides and Proteins (H Kienhuis, G Blasse and J Matze), 2015
Action of Ganglion Blocking Drugs on Choline Acetylase (Dr J E Gardiner), B A 71
Action of Inhibitor-β on the Growth of *Striga* Seedlings (C N Williams), 1577
Action of Manganese Dioxide on Simple Carbohydrates (Dr J L Bose, Dr A B Foster, Prof M Stacey and Dr J M Webber), 1301
Action of Mixed Solvents on Wool (J C Atkinson, A Filson and Prof J B Speakman), 444
Action of Ribonuclease on Nerve Axoplasm as Demonstrated by Silver Staining (R K Winkelmann and Robert W Schmit), 553
Action of Trypsin on α-Carbethoxy-L-lysyl-L-serylglycine and its O-Phosphorylated Analogue (Dr D Theodoropoulos, H Bennich, G Folsch and Prof O Mellander), 187
Action of Yeast on Glucose Changes in Adenosine Di- and Tri-phosphate Concentrations in the Early Stages of the (Dr J O Laws and Dr L H Stickland), 1246
Action (An Antimetabolic), of Vitamin K (Prof E Quagliariello, C Saccone, E Rinaldi and M R Alioto), 820
Action (An Antimineralocorticoid), of some Saluretic Sulphonamides (Dr G C Kennedy and Dr J D Crawford), 1492
Action (Atherogenic), of Excess Hydrocortisone Mechanism of the (Dr Henry Grossfeld), 38
Action (Biological), of Deoxyribonuclease I on the Growth of *Euglena gracilis* (Dr Rudolph K Zahn), 1324
Action (Biological), of Potassium-40 in Naturally Occurring Potash Salts (Prof E Welte and Kl Mechsner), 1958
Action (Growth-Controlling), of Human Serum in Cell Culture (Dr Kari Penttinen and Dr Erkki Saxen), 1570
Action (Hormone) Mechanism of (Prof Aaron B Lerner), 674
Action (Insecticidal), of Ethylene *Bis*dithiocarbamates (R D McMullen), 1338
Action (Joint), of Gibberellic Acid and Coumarin in Germination (A M Mayer), 826
Action (Nervous) The Discrete and the Diffuse in (James Arthur Lecture on the Evolution of the Human Brain), (Prof D P C Lloyd), 1777
Action (Neuromuscular Blocking), of some Antibiotics (G Bezzi and G L Gessa), 905
Action (Protective), of Interferon against Infection with West Nile Virus Duration of (Dr Alick Isaacs and Marguerite A Westwood), 1232
Action (Radiomimetic), of Lipoxidase (P Puig Muset, J Martin Esteve and J Valls Mateu), 1506
Action (Radioprotective), of Methoxamine (A D Smith, Dr M J Ashwood-Smith and Doreen Lowman), 1729
Action (Thiamine-sparing), of Sorbitol in Rats and Mice (Dr T B Morgan and Prof John Yudkin), 909
Action (Tryptic) O-Phosphorylated and Unphosphorylated Peptide-Substrates suitable for (D Theodoropoulos, H Bennich and Prof O Mellander), 270
Action Potentials from Single Nodes of Ranvier in Potassium-rich Solutions (Dr Hans-Christoph Luttgau), 1494
Action Potentials (Resting and), of Reversed Polarity in Frog Nerve Cells (Dr I Tasaki), 1574
Actions (Anti-Atherogenic and Endocrine) The C_{17}-OH Group of Œstradiol—Relationships between its (Dr Manuel Rene Malinow, Alvaro L Gimeno, Amanda A Pellegrino-Iraldi, Martha A Fernandez-Gimeno, Jorge L Lacuara and Jaime A Moguilevsky), 1720
Activated Charcoal Carbonization of Coals in the Presence of (Studies of Coal), (R L Bond, A M Goodridge, A R Murnaghan, D H Napier and D J Williams) 425
Activated Charcoal and Clays Insecticidal Effects of (S K Majumder, K S Narasimhan and V Subrahmanyan), 1165
Activation of Pituitary Acid Phosphatases *in vitro* by Whole Hypothalamic Extract Effects of Methylthiouracil or Thyroidectomy on (Dr V Schreiber and Dr V Kmentova), 728
Activation of Staphylococcal-free Coagulase by Purified Human Prothrombin (G Haughton and E S Duthie), 116
Activation Analyses of Six Trace Elements in Marine Biological Ashes Some (R Fukai and Prof W W Meinke), 815
Activation Analysis (Neutron) Determination of Chlorine in Muscle Tissues by (Dr Jonas Bergstrom), 1504
Activation and Inhibition of Adrenaline Metabolism (Dr Julius Axelrod and Dr Robert Tomchick), 2027
Activation and Inhibition of the Arylesterase of Human Serum (Prof E G Erdos, C R Debay and M P Westerman), 430
Active Fractions (Biologically), of Deoxyribonucleic Acid Immunization with, and Subsequent Specific Infection of Mice (Dr M Kohoutova), 1965
Active Principles of the Neurohypophysis of Cold-blooded Vertebrates—Chromatographic and Biological Characteristics of Fish and Frog Neurohypophysial Extracts (B T Pickering and Prof H Heller), 1463 , Pharmacological Evidence for the Presence of Arginine Vasotocin and Oxytocin in Neurohypophysial Extracts from Cold-blooded Vertebrates (Wilbur H Sawyer, Robert A Munsick and Prof H B van Dyke), 1464 , Arginine Vasotocin (Panayotis G Katsoyannis and Prof Vincent du Vigneaud), 1465
Active Transport of Uric Acid through the Human Erythrocyte Membrane (Dr Kay Overgaard-Hansen and Dr Ulrik V Lassen), 553
Active (Photosynthetically) Accessory Pigments of Cryptomonads (Photoreactive Pigments in Flagellates), (Dr F T Haxo and D C Fork), 1051
Actively Fermenting Rumen of Sheep Relationship between *p*H and Volatile Fatty Acid and Diversion of Saliva from the (W R McManus), 1572
Activities (Chemical), of E *coli* adsorbed on a Resin, 'Dowex-1' (Tsutomu Hattori and Choseki Furusaka), 1566
Activities (Enzymic), of Human Skeletal Muscle Mitochondria—a Tool in Clinical Metabolic Research (Dr L Ernster, Dr D Ikkos and Dr R Luft), 1851
Activities (Intracellular), of Sodium and Potassium Glass Micro-Electrodes for Measuring (Dr J A M Hinke), 1257
Activities (Oxidative and Phosphorylative), of Cytoplasmic Particles from Plant Tissue Cultures (Taiki Tamaoki, Prof A C Hildebrandt, A J Riker, R H Burris and Bunji Hagihara), 1491
Activities (Plant Growth), of 5- and 8-Halogeno- Dihydro- and Tetrahydro-1-naphthoic Acids (Toshio Fujita, Sadao Imai, Koichi Koshimizu, Tetsuo Mitsui and Jiro Kato), 1415
Activity of Carbonic Anhydrase in Erythrocytes Influence of X-Rays on, and on their Haemolytic Resistance (A Lauwers, J Van Bavinchove and W Dierick) 111
Activity (Anticoagulant), of Human Arterial Mucopolysaccharides (Prof John E Kirk), 369
Activity (Anterior Pituitary-like), of Rumen Contents (Dr F A Soliman), 1723
Activity (Antileukaemic), of Polyporic Acid (J F Burton and B F Cain), 1326
Activity (Antiviral Chemotherapeutic), of Isatin β-thiosemicarbazone in Mice infected with Rabbit-pox Virus (D J Bauer and F W Sheffield), 1496
Activity (Cytochrome Oxidase), in the Sea Urchin Egg An Inhibitor of (Rachele Maggio and Alberto Monroy), 68
Activity (Diuretic) Sulphonamides with (Dr W Logemann, Dr P N Giraldi and Dr M A Parenti), 1711
Activity (Electrical), in the Muscle Cells of *Ascaris lumbrocoides* (Dr M Jarman), 1244
Activity (Geomagnetic), at Halley Bay on Disturbed Days (J MacDowall), 1543
Activity (High Ganglion-blocking) Congeners of Pempidine with (L Bretherick, G E Lee, E Lunt, W R Wragg and N D Edge), 1707
Activity (Increased Circulating Insulin-like), in Obese-Hyperglycaemic Mice (Jean Christophe, Yves Dagenais and Jean Mayer), 61
Activity (Lipase), in the Brown and Yellow Adipose Tissue of the Bat (Prof J C George and J Eapen), 59
Activity (Metabolic), of Deoxyribonucleic Acid in the Seminal Vesicle Influence of Sexual Stimulation on the (Dr S R Pelc), 1414
Activity (Nuclease), of Bean (*Phaseolus vulgaris*) Hypocotyls Influence of Kinetin β-Indoleacetic Acid and Gibberellic Acid on (Dr W Maciejewska-Potapczyk), 557
Activity (Optical), of Stercobilin and *d*-Urobilin (Prof C H Gray, P M Jones, Dr W Klyne and Dr D C Nicholson), 41
Activity (Oxidase), in the Mitochondria of the Human Heart Histochemical Localization of (Dr M S Burstone), 476

INDEX

Activity (Oxytocic and Pressor) Peptides with, obtained from Acidified Rat Serum (Prof H Croxatto, T Pereda and R Mellada), 1496
Activity (Paralysing), of *d*-Tubocurarine Chloride Increase by Chlorothiazide of the (Prof W Ferrari, G L Gessa and G Sangiorgi), 1235
Activity (Phagocytic), of the Macrophage System Assessment of the (Prof D L J Bilbey and Dr H Salem), 992
  Influence of Sulphur Dioxide Inhalation on the (Prof D L J Bilbey and Dr H Salem), 722
Activity (Phagocytic), of the Reticulo-Endothelial System Effect of Sulphonamides on the (Prof T Nicol and I A Sewell), 1241
Activity (Physiological), in Extracts of *Albizia* Species (A Lipton), 822
Activity (Plant-Growth Promoting) Isolation of Fatty Alcohols with, from Maryland Mammoth Tobacco (Dr A J Vlitos and Dr D G Crosby), 462
Activity (Positive Inotropic), of Cytidine Triphosphate (Winifred G Nayler and Marian McCulloch), 67
Activity (Secular Solar) Changes in the Climate of the Atlantic–European Area and (Z Gregor and L Křivsky), 682
Activity (Urinary β-Glucuronidase), in Patients with Bone Fractures (F J W Lewis and Dr Constance H J Plaice), 1249
Activity (Volcanic), on the Moon (N A Kozyrev), 856
Activity (Xanthine Oxidase) A Rapid and Sensitive Method for the Determination of, using the Oxygen Electrode (Metry Bacila and Dr Gilberto G Villela), 1394
Actomyosin-like Protein from Human Thrombocytes Extraction of an (M Bettex-Galland and Dr E F Luscher), 276
Acton Society Trust Creative Leadership in a State Service—a General Survey (Sir George Schuster), (Hospitals and the State—Hospital Organization and Administration under the National Health Service, Sixth and Final Research Report), 1087, 1201
Actual Distribution of the Number and Volume of the Islets of Langerhans in Different Size Classes in Non-diabetic Humans of Varying Ages (Bo Hellman), 1498
Acute Radiation Syndrome—a Medical Report on the Y-12 Accident, 1958 (compiled by Dr Marshall Brucer), (United States Atomic Energy Commission, Report ORINS-25), 1022
Acute and Chronic Morphine Administration Noradrenaline and Adrenaline in the Rat Brain during, and during Withdrawal (Dr Lars-M Gunne), 1950
Ada, G L, and others Failure to Recover Infective 'Ribonucleic Acid' from Myxovirus Preparations, 360
Adair, M E (Naylor, G R E, and) Serological Distinction of Adult and Foetal Human Haemoglobin, 1854
Adams, G K Rocket Propulsion (Thermodynamic Aspects of the Choice of Rocket Propellants), 1265
Adams, J B Biosynthesis of Chondroitin Sulphates, 274
  Appointed director of a new establishment to deal with controlled thermonuclear research, 595
Adams, L D Elected president of the Mathematical Association, 33
Adaptation of a Lead-tolerant Population of *Agrostis tenuis* to Low Soil Fertility (D Jowett), 43
Adaptation (Temporal), to Spatial Detail Vision Measurements of (A J Seyler and Z L Budrikis), 1215
Added Substances Effect of, on the Rate of Reductive Photo-bleaching (Reductive Photo-bleaching of Eosine), (Kengo Uchida, Shunji Kato and Masao Koizumi), 1620
Addingley, Dr C G, and Gaze, Dr R Measurement of Asbestos Dust Concentrations with the Long-Running Thermal Precipitator, 715
Addition of Aureomycin Effective Increase in Nematode Populations by the (C O R Everard and William A Feder), 1887
Additions to the British Museum (Natural History), (Sir Gavin de Beer), 1682
Adenine in Leaves of *Acer saccharinum* L Formation of Allantoin and Allantoic Acid from (Robert L Barnes), 1944
Adenine Dinucleotide (Flavin) Binding of the Sulphydryl Group in D-Amino-Acid Oxidase Apo-Protein with (Dr Kunio Yagi and Takayuki Ozawa), 1227
  Change of Absorption Spectrum of, by its Binding with both D-Amino Acid Oxidase Apo-Protein and Benzoate (Dr Kunio Yagi, Takayuki Ozawa and Minoru Harada), 1938
Adenosine Deaminases of Adenylic Acid and, in Rat Kidney (Dr M Zydowo), 1641
Adenosine Di- and Tri-phosphate Concentrations Changes in, in the Early Stages of the Action of Yeast on Glucose (Dr J O Laws and Dr L H Stickland), 1246
Adenosine Triphosphate Equilibrium Constant of the Galactokinase Reaction and Free Energy of Hydrolysis of (Dr M R Atkinson, Eleanor Johnson and Prof R K Morton), 1925
Adenosine Triphosphate and Serotonin Release of, from Injured Cellular Blood Elements in Extracorporeal Circuits (Dr H S S Sarajas, Dr R Kristoffersson and Dr M H Frick), 1127
Adenylic Acid and Adenosine Deaminases of, in Rat Kidney (Dr M Zydowo), 1641
Adhatoda vasica Nees A Bronchodilator Alkaloid (Vasicicone) from (A H Amin and D R Mehta), 1317
Adhesion (Ultrasonic Barium Titanate), and Paste Transducers (Dr A Lutsch), 1458
Adinolfi, M, and others Haemoglobin Pattern of the Cyclostome *Pertromyzon planeri* during the Course of Development, 1325
Adipose Tissue in Normal and Diabetic Rats Release of Non-Esterified Fatty Acids from (Dr J Wendeova and Dr J Pav), 1147
Adipose Tissue (Brown and Yellow), of the Bat Lipase Activity in the (Prof J C George and J Eapen), 59
Adler, H I Biological Effects of Low Doses of Ionizing Radiations (Observations with a variant of *Escherichia coli* which did not Synthesize Catalase), 1112
Adler, Prof S Darwin's Illness, 1102
Administered (Intravenously) Lactose Labelled with Carbon-14 Preliminary Observations on the Fate of (Dr Frederick J Carleton and Dr Henry R Roberts), 1650
Administration of Heavy Water Saliva-Serum Ratios of Deuterium Oxide after (Nan Taggart and Dr F E Hytten), 457
Administration of Tetracycline Inhibition of Skeletal Formation in the Chick Embryo following (Gerrit Bevelander, Hiroshi Nakahara and Gloria K Rolle), 728
Administration (Acute and Chronic Morphine) Noradrenaline and Adrenaline in the Rat Brain during, and during Withdrawal (Dr Lars-M Gunne) 1950
Administration (British) The Spirit of, and some European Comparisons (C H Sisson), 128
Administration (Intravenous), to Rats Presence of certain Onium Compounds in Brain Tissue following (Prof Ruth R Levine), 1412
Administration (Prolonged Thyroid) Effect of, on Male Aged Rats (Prof John F Lhotka, Lloyd Glenn McArthur and Arthur A Hellbaum), 1149
Administration and Law The Economics of Nuclear Power, including (edited by I R Maxwell, P W Mummery and Philip Sporn), Vol 2, *review* by R Brightman, 1673
Administrative Problems in Expanding Universities (Home Universities Conference, 1959), 1613
Admiralty Grant of £9,534 10s to the University of Oxford, for the continuation of research on centimetre waves and fundamental problems, 1273
Adonis annua L Occurrence of Astaxanthin in the Flower Petals of (A Seybold and Prof T W Goodwin), 1714
Adrenal Catechol Amines induced by Reserpine Abolition by Chlorpromazine of the Inhibiting Effect of Iproniazid on the Depletion of (F Camanni, Dr G M Molinatti and M Olivetti), B A 65
Adrenal Extracts 3,4,ω-Trihydroxyacetophenone 3-methyl Ether in (J von Euw, Prof T Reichstein, R Neher, Dr A Wettstein, Dr J F Tait and Dr S A S Tait), 268
Adrenal Lipids (Rat) Use of Porter–Silber and Schiff Reactions as Spot Tests for Steroids applied on Paper and their Application to the Study of (Dr Marion K Birmingham), B A 67
Adrenal Medulla (Denervated) Effects of Reserpine on Secretion from the (L Stjarne and S Schapiro), 2023
Adrenal Medullary Secretion of Catechol Amines Effects of 1,4-Dihydra zinophthalazine on Organ Content and (M Bydgeman and L Stjärne), 1646
Adrenalectomized Mice (Normal and) Effect of Diet on the Blood Sugar and Liver Glycogen Level of (B P Block and Dr G S Cox), 721
Adrenalectomized Rats Sodium Chloride Intake and Urinary Histamine in (Dr T Bjuro and Dr H Westling), 1241
Adrenalectomy Effect of, on the Hormone Content of the Thymus in the Rat (Dr J Comsa), 279
Adrenaline Formation of Noradrenaline from, by Rat Liver Mitochondria (Dr Kunio Yagi and Dr Toshiharu Nagatsu), 1316
Adrenaline in the Rat Brain during Acute and Chronic Morphine Adminstration and during Withdrawal Noradrenaline and (Dr Lars-M Gunne), 1950
Adrenaline Metabolism Activation and Inhibition of (Dr Julius Axelrod and Dr Robert Tomchick), 2027
Adrenaline and Noradrenaline Response of Cholinergically Innervated Sweat Glands to (Dr David P C Lloyd), 277
Adrenocortical Steroids Biosynthesis and Secretion of (Biochemical Society Symposium on), 415
Adrenocorticosteroids *in vitro* Failure of Corpuscles of Stannius from Winter Flounder (*Pseudopleuronectes americanus*) to Synthesize (Dr J G Phillips and Dr P J Mulrow), 558
Adsorption Isotherm (Langmuir) Kinetic Study of Dextransucrase based on the (W Brock Neely and C F Thompson), B A 64
Adult Chicken Blood Cytological Identification of Proliferating Donor Cells in Chick Embryos injected with (P M Biggs and L N Payne), 1594
Adult *Drosophila* Synthesis of Deoxyribonucleic Acid in (Per Oftedal), 1961
Adult Education, National Institute of After Work—Leisure and Learning in Two Towns (R Ruddock and Dr A Wilson), 1034
Adult Education, Universities Council for Report for 1957-1958, 331
Adult Houseflies Mechanisms of Resistance of, to the Insecticide Dieldrin (F P W Winteringham and A Harrison), 608
Adult Lymphoid Tissues Influence of, on Polyoma-induced Tumours (Dr V Defendi and Dr H Koprowski), 1579
Adult Mice Tolerance to Skin Homografts of, after Parabiosis (Dr B A Rubin), 205
Adult Noctuidae (Lepidoptera) in Cambodia Blood-feeding Habits of (W Buttiker), 1167
Adult Sheep (Foetal and) Inositol Concentration in the Cerebrospinal and Ocular Fluids and Tissues of the (D A Nixon), 906
Adult and Foetal Human Haemoglobin Serological Distinction of (G R E Naylor and M E Adair), 1854
Advanced Analytical Chemistry (Prof Louis Meites and Prof Henry C Thomas), *review* by W I Stephen, 1525
Advanced Gas-cooled Reactors (United States Atomic Energy Commission and the United Kingdom Atomic Energy Authority to exchange Technical Information on), 1361
Advancements in Metallurgy, *review* by Dr F C Thompson, 1765
Advances in Biological and Medical Physics, Vol 6 (edited by Cornelius A Tobias and John H Lawrence), *review* by Dr N M Blackett, 1766
Advances in Carbohydrate Chemistry (edited by Melville L Wolfrom in association with R Stuart Tipson), Vol 13, review by Dr Alfred Gottschalk, 662
Advances in Catalysis and related Subjects, Vol 9 (edited by Adalbert Farkas), *review* by Dr E B Maxted, 750, Vol 10 (edited by D D Eley, W G Frankenburg and V I Komarewsky), *review* by Dr F S Stone, 1974
Advances in Electronics and Electron Physics (edited by L Marton, assisted by Claire Marton), Vol 10, *review* by J R Tillmann, 1601
Advances in Inorganic Chemistry and Radiochemistry (edited by H J Emeleus and A G Sharpe), Vol 1, *review* by Dr D W A Sharp, 1756
Advances in Pest Control Research (edited by R L Metcalfe), Vol 2, *review* by F C Bawden, 1258
Advances in Semi-Conductor Science—Proceedings of the Third International Conference on Semi-Conductors, Rochester 1958 (edited by H Brooks), *review* by Dr J R Tillman, 1674
Advances in Virus Research (edited by Kenneth M Smith and Max A Lauffer), Vol 6, *review* by N W Pirie, 920
Advisory Committee on the Inland Telegraph Service Report of the, 1191
Advisory Council, National Joint Report of an inquiry into the Efficient Use of Man-power in Industry (Ministry of Labour and National Service), 25

Advisory Council on Scientific Policy Annual Report for 1958-1959, 1897
Advisory Council on Scientific Policy (Committee on Scientific Man-power) Report on Scientific and Engineering Man-power in Great Britain (1959), 1982
Advisory Council on Scientific Policy of the Union of South Africa First and Second Annual Reports, 1191
Advisory Council for Technological Education (London and Home Counties Regional) Tenth Annual Report, 94
Advisory Group for Aeronautical Research and Development (Combustion and Propulsion Panel) Discussion on the Chemistry of Propellants, 778
Discussion on Basic Problems in Propulsion, 779
Advisory Water Committee, Central First Report of the Subcommittee on the Growing Demand for Water, B A 18
Report of the Subcommittee on Information on Water Resources, B A 18
Re-appointments and new appointments 153
Aedes Mosquitoes Control of Hatching in the Prediapause Eggs of (Dr J D Gillett), 1621
Aedes aegypti (L) Probing Behaviour of, in Response to Heat and Moisture (L Burgess), 1968
A E I -Birlec, Ltd Name of Birlec, Ltd , to be changed to, 1535
Aerial Photographs of Quarries and Mines Exhibition of (Geological Museum), 855
Aerobic Corrosion Fatigue Life of Steel Relationship of *p*H to (Dr Frederick J Radd, L Hugh Crowder and Louis H Wolfe), 2008
Aerobic Oxidation of D-Xylose Glycolaldehyde Trapped from, by *Torulopsis utilis* (V Bolcato and G Leggiero), 1318
Aerobiosis and Anaerobiosis Fluorescence Measurements of Mitochondrial Pyridine Nucleotide in (Localization and Assay of Respiratory Enzymes in Single Living Cells), (Prof Britton Chance and Dr Bo Thorell), 931
Aeronautical Research and Development, Advisory Group for (Combustion and Propulsion Panel) Discussion on the Chemistry of Propellants, 778
Discussion on Basic Problems in Propulsion, 779
Aeronautical Society, Royal Formation of an Agricultural Aviation Group, 25
Discussion on the Structural Effects of Kinetic Heating, 30
Prize of £5,000 offered by Henry Kremer for the first successful flight of a Man-powered Aircraft, 1534
Aeronomy Chemical—Proceedings of the Conference on (sponsored by the Geophysics Research Directorate, Air Force Cambridge Research Center, Cambridge, Mass , 1956), (edited by M Zelikoff), *review*, 1011
Aerosols Pressurized Packaging—(A Herzka and J Pickthall), *review* by Dr V G W Harrison, 1437
Aerva tomentosa Forsk *In vitro* Culture of the Inflorescences, Flowers and Ovaries of an Apomict (Prem Murgai), 72
Afferents (Vagal), in the Monkey (Prof Kent M Chapman and Prof James W Pearce), 1237
Affinites Chromosomiqes dans le Genre Coffea Recherchés sur les (J Bouharmont), 518
Affinity of Lysozyme to Structural Elements of the Bacterial Cell as studied with Enzyne Labelled with Radioactive Iodine (Prof C Weibull, B Zacharias and H Beckman), 1744
Africa Vegetation Map of (Explanatory notes by R W J Keay, with a French translation by A Aubreville), 594
Africa (East) Higher Education in (White Paper on), 243
Report of the Working Party on Higher Education in (1958), 243
Higher Education in (Work on the new Technical Institute), 1611
Looking for Animals in (E H Tong), 1535
Sea Fisheries Research in, 855
Africa (South), Advisory Council on Scientific Policy of the Union of First and Second Annual Reports, 1191
Africa (Southern) Eels in (R A Jubb), 827
Africa (Tropical) The Insect Pests of Cotton in (E O Pearson, assisted by R C Maxwell Darling), *review* by Dr W E China, 1011
Africa (Tropical East) Flora of——Leguminosae sub-family Mimosoideae (J P M Brenan), 409
Africa (West) *Capsicum* Species of (C Oyolu), 1163
African Botany, 594
African (British East) Waters Black Marlin in (F Williams), B A 78
African (Central) Scientific Research, 407
African (East) Marine Fisheries Research Organization Annual Report for 1958, 855
African (South) Animal Life—Results of the Lund University Expedition in 1950-51, Vol 5 (edited by Bertil Hanstrom, Per Brinck and Gustaf Rudebeck), *review*, 133
African (South) Council for Scientific and Industrial Research Thirteenth Annual Report (1957-58), 1449
African (South) Peoples Haptoglobin and Transferrin Variants in Bushmen and some other (Dr N A Barnicot, J P Garlick, Ronald Singer and Dr J S Weiner), 2042
After Work—Leisure and Learning in Two Towns (R Ruddock and Dr A Wilson), 1034
After-Effect (Fatigue-Induced), in Zinc Single Crystals (A H Meleka and G B Dunn), 896
Agar (Simmons's Citrate) Production of Colicines in (Dr J Paravassiliou), 1339
Agar Diffusion Estimation of Vitamin C by (Alan H Chaiet and Louis Chaiet), 1487
Agar Electrophoresis of Normal Soluble Proteins in Guinea Pig Liver (Prof Iv Goranov, Y Todorov, X Skatshokova, M Hlebarova and P Kuzmanova), B A 64
Agar Gel Direct Spectroscopic Examination of Electrophoretic Zones in (Dr G H Beaven and W B Gratzer), 359
Agar Substrates Maintenance of Parathyroid Tissue Fragments on (Dr John H Wallace, Dr George J Hill, Jean M McCarthy and Dr John R Brooks), 1734
Agar and Soil Cultures Translocation of Cobalt-60 and Caesium-137 by Fungi in (Dr Erna Grossbard and Dr D R Stranks), 310
Age of *Carcharodon megalodon?* (W Tschernezky), 1331
Age of Science Education for the (Report of the Science Advisory Committee to the President of the United States), 81, 87
Liberty in an (Sir Solly Zuckerman,) 135
Age of the Stars Structure and (C B Haselgrove and F Hoyle), 1986
Age and the Working Lives of Men (F Le Gros Clark), 318
Age' ('Cosmic Ray), for the Iron Meteorite 'Carbo' Calculation of a (Dr Royal R Marshall), 117
Age (Old) Mental Health Problems in (World Health Organization of the United Nations, Technical Report Series No 171), 1844
Age Determination in *Mansonioides* Mosquitoes (R H Wharton), 830
Age Determination in Wild Rabbits (R H Taylor), 1158
Aged Rats (Male) Effect of Prolonged Thyroid Administration on (Prof John F Lhotka, Lloyd Glenn McArthur and Arthur A Hellbaum), 1149
Ageing A Theory of (J Maynard Smith), 956 , (Prof Leo Szilard), 957
Ageing of Plastics International Symposium on the (Eighth German Plastics Convention,) 508
Ageing (X-Ray Induced) Latent Period of—a Study based on Mortality Rate and Tumour Incidence (Dr H I Kohn and Dr P H Guttman), 735
Ageing Worker The 318
Agent (Pathogenic), of Tyzzer's Disease of Mice Pure Culture of the (Dr K Kanazawa and A Imai), 1810
Agents (Anti-Staling) Interaction of, with Starch (Prof E J Bourne, A I Tiffin and Dr H Weigel), 547
Ager, Dr J A M The Heterogeneity of Human Haemoglobin, *review*, 840
Ager, Dr J A M , and others Detection of Thyroid Antibodies using Bentonite Particles, 478
Ages (Different) Enzymes and Radioactivity in Erythrocytes of (Dr Lester M Levy, Harry Walter and Martin D Sass), 643
Ages (Rubidium-Strontium), of Lewisian Rocks from North-West Scotland (Dr Bruno J Giletti), 1793
Ages (Varying) Actual Distribution of the Number and Volume of the Islets of Langerhans in Different Size Classes in Non-diabetic Humans of (Bo Hellman), 1498
Agglutinating Auto-Antibody (Panagglutinin) Production of an, Active upon Tanned Erythrocytes in the Rabbit (P O Hubinont, P Ghysdael and O Thys), 1250
Agglutinating Sera and the Corresponding Red Blood Cell Receptors Influence of Streptomycin Solutions on the Interaction between the (Dr M Kout and Dr Z Kubickova), 639
Agglutinins in Lymphomatous Mouse Tissue Partial Identification of Lysins and (Dr Eric Ponder and Ruth V Ponder), 819
Aggregation of an Acridine Dye on Native and Denatured Deoxyribonucleates (Dr D F Bradley and Dr G Felsenfeld), 1920
Aglycone (Cardiac) Microbiological Transformation of a (Hayao Nawa, Masao Uchibayashi, Takaaki Kamiya, Togo Yamano, Hideo Arai and Matazo Abe), 469
Agricultural Advantage The Land of Britain—is it Used to the Best (Association of Agriculture and the Extra-Mural Department of the University of London Lectures on), 1845
Agricultural Aviation Group formed by the Royal Aeronautical Society, 25
Agricultural Botany at Bangor, 502
Agricultural Botany at Leeds, 405
Agricultural Botany, National Institute of Leaflets on Fodder Beet, Mangels and Swedes, 1777
Agricultural Bureaux, Commonwealth Appointment of A Perera as chairman of the Executive Council, 943
Agricultural Chemistry in Aberystwyth, 317
Agricultural History Society, British Winter Conference (G E Fussell), 1916
Agricultural Institute of Ireland (An Foras Taluntais), Dublin, 28
Appointment of Dr T Walsh as director, 29
Appointment of Dr L B O'Moore as chief of the Animal Production Division, 29
Appointment of J J Byrne as chief of the Rural Economy Division, 29
Award of junior postgraduate agricultural research scholarships, 1612
Division of Plant Sciences and Crop Husbandry, 1847
Agricultural Research The Use of Radioisotopes in (Ministry of Food and Agriculture of the Government of India, Food and Agriculture Organization of the United Nations, International Atomic Energy Agency and Unesco South East Asia Science Co-operation Office Course on), 1451
Agricultural Research in Britain, 238
Agricultural Research in Eire—An Foras Taluntais (The Agricultural Institute), 28
Appointment of Dr T Walsh as director, 29
Appointment of Dr L B O'Moore as chief of the Animal Production Division, 29
Appointment of J J Byrne as chief of the Rural Economy Division, 29
Award of junior postgraduate agricultural research scholarships, 1612
Division of Plant Sciences and Crop Husbandry, 1847
Agricultural Research, Indian Council of Misc Bulletin No 82, Bovine Stars of India, 941
Agricultural Research, Indian Council of, and Unesco International Symposium on Algology, 595
Agricultural Research Council Memoirs of the Soil Survey of Great Britain—England and Wales , The County of Anglesey—Soils and Agriculture (E Roberts), 154
Report for 1957-58, 238
Appointment of Lord Netherthorpe and Prof F W Rogers Brambell as members, 508
Special Promotions, 859
Grant of £1,893 to the University of Leeds, for two research projects in the Department of Agriculture , and £2,807 for research into the interpretation of fibre types in sheep, in the Department of Anatomy, 1108
Strontium-90 in Human Diet in the United Kingdom, 1111
Appointment of Prof E G Cox as secretary, 1688
Agricultural Research Council, the Medical Research Council and the Development Commission on Biological (Non-Medical) Problems of Nuclear Physics Appointment of Sir James Denby Roberts as chairman of the Joint Committee of the, 237
Agricultural Research Scholarships Junior Postgraduate (Agricultural Institute of Ireland Awards), 1612
Agricultural Research Station (Central), Carapichaima, Trinidad (Dr A J Vlitos), 331

- Agricultural Science Sixth Easter School in, at the University of Nottingham School of Agriculture (The Measurement of Grassland Productivity), 154
- Agricultural Society of England, Royal Medal for research work of benefit to Agriculture, 1450
- Agricultural Variety Trials Influence of Site and Season on (A Sandison), 834
- Agricultural and Horticultural Crops The Control of Pests and Diseases in (G L Hey and K Marshall), *review* by F C Bawden, 1258
- Agriculture Medal for research work of benefit to (Royal Agricultural Society of England), 1450
  - Nature and (Dr E B Worthington), 1535
- Agriculture, Association of, and the Extra-Mural Department of the University of London Lectures on the Land of Britain—is it Used to the Best Agricultural Advantage?, 1845
- Agriculture, Fisheries and Food, Ministry of Appointment of Dr H R Barnell as chief scientific adviser (food), 503
  - Technical Bulletin No 7, Plant Nematology, 855
  - Infestation Control, a Service to Agriculture and Food Storage, 941
- Agriculture and Food Storage Infestation Control, a Service to (Ministry of Agriculture, Fisheries and Food), 941
- *Agrostis tenuis* Adaptation of a Lead-tolerant Population of, to Low Soil Fertility (D Jowett) 43
- Ahmed, Z F, and others *In vitro* Study of the Anthelminthic Property of *Artemesia monosperma* grown in Egypt, 647
- Ahmedabad Textile Industry's Research Association, 160
  - Proceedings of the Fifth Management Conference (1959), 1913
- Ahronheim, Dr J H (Reed, Dr T Edward, and) An Association between Abo Blood Groups and Fertility in a Normal American Population, 611
- Ahuja, Dr M L, and others Statement on Biological and Chemical Warfare, 1018
- Aid of a Continually Renewable Filter A Partial Chemical Characterization of Maize Coleoptile Cell Walls prepared with the (Prof Aleksander Kivilaan, Teofila C Beaman and Robert S Bandurski), B A 81
- Aid in the Study of Fungal Spore Morphology '*LO*-Analysis' as an (Dr M M Payak), 738
- Aid (British), for NATO Scientific Courses, 406
- Aigrain, Prof P, and others (edited by) Progress in Semiconductors, Vol 3, *review* by Dr R A Hyman, 1754
- Aiken, Prof Howard H Awarded the Vermeil Medal of the City of Paris, B A 16
- Ainger, F W, and Herbert, I M Special Ceramics (Preparation of Phosphorus-Nitrogen Compounds as Non-porous Solids), 1116
- Air Condensation Processes for the Extraction of Radioactivity from (Rama), 1789
  - Habit of Ice Crystals grown in Hydrogen, Carbon Dioxide and, at Reduced Pressure (A P van den Heuvel and Dr B J Mason), 519
- Air and in Water Maximum Permissible Body Burdens and Maximum Permissible Concentrations of Radionuclides in, for Occupational Exposure (United States National Bureau of Standards, Handbook 69), 939
- Air Density in the Upper Atmosphere from Satellite Orbit Observations (Dr G V Groves), 178
- Air Force Cambridge Research Center (United States) Conference on Silicon Carbide, 158
- Air Force Cambridge Research Center (United States), (Electronics Research Directorate) Conference on Extremely High Temperatures, Boston, 1958 (edited by Dr Heinz Fischer and Lawrence C Mansur), *review* by Dr T E Allibone, 83
- Air Force Cambridge Research Center (United States), (sponsored by the Geophysics Research Directorate of the) The Threshold of Space—Proceedings of the Conference on Chemical Aeronomy, Cambridge, Mass, 1956 (edited by M Zelikoff, *review*, 1011
- Air Force Office of Scientific Research (United States) First Annual Astronautics Symposium—Vistas in Astronautics (edited by Morton Alperin and Marvin Stern), *review* by D G King-Hele, 663
- Air Ministry (Meteorological Office) Geophysical Memoirs No 100, World Distribution of Atmospheric Water Vapour Pressure (G A Tunnell), B A 15
- Air Pump (Boyle's) Robert Hooke and (Dr H D Turner), 395
- Air Surveys and the Social Scientist (Leo Silberman), 244
- Air-borne Nitrogenous Material and other Plant Nutrients Surface of the Ocean as a Source of (Dr A T Wilson), 99
- Aircraft Establishment, Royal Appointment of Prof M J Lighthill as director, 151
  - Promotion of P A Hufton to Chief Scientific Officer and appointment as head of the Aerodynamics Department, 233
- Aircraft (Man-powered) Prize of £5,000 offered by Henry Kremer for the first successful flight of a, 1534
- Aircraft Noise (Jet) Effect of, on Hearing (Surg Lieut R R A Coles and J J Knight), 1803
- Aitken, Dr R S Hundred Years of the University of Calcutta, *review*, 218
- Aitken W G, and others Summary of the Geology of Tanganyika, Part I, Introduction and Stratigraphy, 1688
- Aiyar, A S, and others Pantothenic Acid Deficiency and Ubiquinone Levels in Rat Liver Mitochondria, 1867
- Åkerman, Dr Lennart, and others Localization and Assay of Respiratory Enzymes in Single Living Cells—Absorbancy Measurements on the *Neberkern*, 929
- Åkerstrom, Stig (Vänngard, Tore, and) Electron Spin Resonance and Divalency of some Dithiocarbamates of the Coinage Metals (Cu, Ag, Au), 183
- Akimov, I, and others Energy Transfer with special reference to Biological Systems (Properties of Isolated Chlorophyll), 690
- Alaska Micropulsation Measurements in California and (W H Campbell and B Nebel), 628

  Vacancies and other Point Defects in Metals and—a Symposium organized by the Institute of Metals, 1957 (Monograph and Report Series, No 23), *review* by Dr F C Thompson, 1765
Alloys (Aluminium–Zinc) Reversion of Nodules formed by the Grain Boundary Reaction in (Ryoji Watanabe and Shigeyasu Koda), 977
Alloys (Binary) Constitution of (Dr Max Hansen), second edition, prepared with the co-operation of Dr Kurt Anderko, *review* by Dr F C Thompson, 1765
Alloys (Iron-Silicon) A New Nitride Precipitate in (G R Booker and J Norbury), 1311
Alloys (Low-Carbon Iron-Silicon) X-Ray Diffraction Pattern of Carbide in (G Konoval, L Zwell, L A Gorman and W C Leslie), 1862
Alloys (Uranium and Thorium) Constitutional Diagrams of (Frank A Rough and Arthur A Bauer), *review* by Dr D E R Hughes, 925
Allpress, J G (Hambly, Prof A N, and) At the Second Australian Spectroscopy Conference (Infra-red Spectra can be used to follow some Solid State Reactions), 1196
Allred, W P Electron Bombardment Floating-zone Melting and Allied Electron Bombardment Techniques (Zone-refining of the Platinum-group Metals), 692
Allsopp, Dr A Effects of Gibberellic Acid on Juvenility in *Marsilea* and certain other Plants, 1575
Alpen, Edward L, and others Lack of Direct Effect of Erythropoietin on Human Erythroid Cells *in vitro*, 1228
Alper, Dr Tikvah Immediate and Low-level Effects of Ionizing Radiations, 1111
Alperin, Morton, and Stern, Marvin (edited by) Vistas in Astronautics—First Annual Air Force Office of Scientific Research Astronautics Symposium, *review* by D G King-Hele, 663
α-Aminoadipic Acid Enzymic Reduction of, by Yeast Enzyme (S Sagisaka and Prof K Shimura), 1709
α-Amino-β-(pyrazolyl-N) Propionic Acid, a New Amino-Acid from *Citrullus vulgaris* (Water Melon), (Dr F F Noe and Dr L Fowden), B A 69
α-Carbethoxy-L-Lysyl-L-serylglycine and its O-Phosphorylated Analogue Action of Trypsin on (Dr D Theodoropoulos, H Bennich, G Folsch and Prof O Mellander), 187
α-Casein The N-Terminal Amino-Acids of (Dr W Manson), 1393
α-Chains Haemoglobin 'Bart's', a Foetal Haemoglobin without (Abnormal Human Haemoglobins), (Dr J A Hunt and Dr H Lehmann), 872
α-Emitting Nuclides in Biological Material Spectroscopic Identification of (Prof W V Mayneord and C R Hill), 667
α-Globulins (γ- and) Production of, by the Isolated and Perfused Rat Spleen (Dr E Espinosa), 1801
α-Hydroxyacetylene Complexes of Platinum (II) Structure of (Dr J Chatt, L A Duncanson and R G Guy), 526
α-Ketoglutaric Acid and Pyruvic Acid in Blood, Cerebrospinal Fluid and Urine (Dr E Zelnicek), 727
α-Naphthalene Acetic Acid Effect of Indole Acetic Acid and, on the Growth, Flowering and Fruit Set in Sweet Potato (G Satyanarayana and Dr G Rangaswami), B A 73
α-Oxidation of Indoleacetonitrile (H F Taylor and Prof R L Wain), 1142
α-Radioactivity of Cerium-142 (F E Senftle, T W Stern and V P Alekna), 630
α- and β-Glycosides A Method for Distinguishing between, by the use of Plant Haemagglutinins (Lectins), (Dr O Mäkela), 111
αε-Diketopimelic Acid Synthesis of Dipicolinic Acid from (the late Joan F Powell and R E Strange) 878
Alpine Mineral Fissures (International Mineralogical Association Symposium on), 1909
Alston, Dr R E, and Turner, Dr B L Applications of Paper Chromatography to Systematics—Recombination of Parental Biochemical Components in a *Baptisia* Hybrid Population, 285
Alternative Synthesis and Behaviour on Hydrolysis 1-Glyceryl-2-*myo*-inositol Phosphate— (Synthesis and Properties of 1-Glyceryl-2-*myo*-inositol Phosphate), (R B Ellis and J N Hawthorne), 790
Altitude (High-) Nuclear Explosions Geophysical Effects of (W A Feibelman), 442
  Magnetic Effects resulting from Two (J A Lawrie, V B Gerard and P J Gill), B A 34
Altitude (High-) Research British Contribution to, 1776
Altman, K I Biological Effects of Low Doses of Ionizing Radiations (Breakdown of Muscle Collagen in Rats previously fed with Labelled Amino-Acids), 1112
Alumina Transparent Sintered—'Lucalox' (General Electric Company of America), 1107
Aluminium extracted by Neutral Citrate-Dithionite Reagent (W M H Saunders), 2037
Aluminium (High-Purity) Analysis for Magnesium in (C A Youngdahl and F E DeBoer), 54
Aluminium and Zirconium Volatile Methoxides of (Dr D C Bradley and Dr M M Faktor), 55
Aluminium Chloride (Anhydrous) A New Method for Working up Processing Mixtures containing (Dr T Széll and A Furka), 117, *erratum*, 595
Al_2O_3-SiO_2 Revised Equilibrium Diagram for the System (Shiger Aramaki and Prof Rustum Roy), 631
Aluminium–Zinc Alloys Reversion of Nodules formed by the Grain Boundary Reaction in (Ryoji Watanabe and Shigeyasu Koda), 977
Alvāger, T and others A New Method for Studying the Functioning of the Lungs, 372
Alvarenga Prize for 1959 awarded to Dr Hilary Koprowski by the College of Physicians of Philadelphia, 683
Amaha, Prof Mikio, and Nakahara, Tomoko Rôle of the Glycolytic Enzyme System in the Germination of Spores of *Bacillus coagulans* var *thermoacidurans* 1255
Ambartsumian, Dr V A Elected a foreign associate of the United States National Academy of Sciences, 95
Ambler, Dr H R Appointed scientific adviser to the United Kingdom High Commissioner in New Delhi, 1448, work of, 1448
Ambler, R P, and Rees, M W ε-N-Methyllysine in Bacterial Flagellar Protein, 56
Ambrose, Dr D Gas Chromatography, 328
America (Arctic North) The Benthos of Soft Sea-bottom in (Dr D V Ellis), B A 79
America (North) The Evolution of (Dr Philip B King), *review* by Dr J W Cowie, 1600
  The Geological Development of, *review* by Dr J W Cowie, 1600
  The Mammals of (Prof E Raymond Hall and Dr Keith R Kelson), *review* by Peter Crowcroft, 1524
America (South) Transport of Driftwood from, to Tasmania and Macquarie Island (Prof H N Barber, Dr H E Dadswell and H D Ingle), 203
American Academy of Arts and Sciences Election of new Fellows and Foreign Honorary Members, 409
  Re-election of Dr Kirtley F Mather as president, 410
American Academy of Political and Social Science Annals, May, 1959, Partnership for Progress—International Technical Co-operation, *review* by R Brightman, 1673
American Association for the Advancement of Science, and Unesco International Oceanographic Congress, 1605
American Indians (South) Frequency of the New Blood Group Antigen Js^a among (Dr Miguel Layrisse and Dr Zulay de Layrisse), 640
American Industry Funds for Research and Development Performance in (United States National Science Foundation, Reviews of Data on Research Development No 14), 1022
American Institute of Mining, Metallurgical and Petroleum Engineers (Metallurgical Society of the) New series of books entitled Metallurgical Society Conferences, 1362
American Journal of Science Radiocarbon Supplement, Vol 1, 1686
American Museum of Natural History Bulletin, Vol 117, Art 6, Studies on Social Groupings in Fishes (Dr C M Breder, Jr), 865
  Bulletin, Vol 117, Art 5, A Taxonomic Revision of the Spotted Skunks of the Genus *Spilogale* (R G van Gelder), 1024
  James Arthur Lecture on the Evolution of the Human Brain—The Discrete and the Diffuse in Nervous Action (Prof D P C Lloyd), 1777
American Philosophical Society Transactions, New Series, Vol 48, Part 6, Preliminary Archaeological Investigations in the Sierra de Tamaulipas, Mexico (Dr Richard S MacNeish), 593
American Population (Normal) An Association between Abo Blood Groups and Fertility in a (Dr T Edward Reed and Dr J H Ahronheim), 611

American Society of Mechanical Engineers Colloquium on Mechanical Impedance Methods for Mechanical Vibrations, 1958 (edited by R Plunkett), *review* by Prof R E D Bishop, 1764
American (North) Mammals, *review* by Peter Crowcroft, 1524
American and European Working Conditions in Industry Fitting the Job to the Worker—a Survey of (European Productivity Agency of the Organization for European Economic Co-operation, Project 335), 422
Amesz, J (Duysens, Prof L N M, and) Energy Transfer with special reference to Biological Systems (Quantum Requirements of Diphosphopyridine Nucleotide in Photosynthesis), 690
Amides (Carbon-14-labelled Amino-Acids and) Translocation of, in the Stem of young Soya Bean Plants (C D Nelson and P R Gorham), 855
Amin, A H, and Mehta, D R A Bronchodilator Alkaloid (Vasicinone) from *Adhatoda vasica* Nees, 1317
Amine Oxides Prophylactic Effects of, in Radiation Injury in Mice (Dr Thomas J Haley, Dr Anna M Flesher and Dr Nathan Komesu), 198
Amines (Adrenal Catechol), induced by Reserpine Abolition by Chlorpromazine of the Inhibiting Effect of Iproniazid on the Depletion of (F Camanni, Dr G M Molinatti and M Olivetti), B A 65
Amines (Aliphatic) and related Compounds High-Voltage Paper Electrophoresis of (Dr D Gross), 1633
Amines (Catechol) Effects of 1,4-Dihydrazinophthalazine on Organ Content and Adrenal Medullary Secretion of (M Bygdeman and L Stjarne), 1646
Amino-Acid (New) from *Citrullus vulgaris* (Water Melon) α-Amino-β-(pyrazolyl-N) Propionic Acid, a (Dr F F Noe and Dr L Fowden), B A 69
Amino-Acid (Carbohydrate—) Inter-relations in Brain Cortex *in vitro* (M M Kini and Prof J H Quastel), 252
'Amino-Acid Imbalance' Effect of, on Growth and Vitamin A Storage in the White Rat (M Rechcigl, jun, S Berger, J K Loosli and H H Williams), 1404
Amino-Acid Phosphates under Physiological Conditions Spontaneous De-amination of (Dr Mella Paecht and Prof A Katchalsky), 1489
D-Amino-Acid Oxidase Apo-Protein Binding of the Sulphydryl Group in, with Flavin Adenine Dinucleotide (Dr Kunio Yagi and Takayuki Ozawa), 1227
D-Amino Acid Oxidase Apo-Protein and Benzoate Change of Absorption Spectrum of Flavin Adenine Dinucleotide by its Binding with both (Dr Kunio Yagi, Takayuki Ozawa and Minoru Harada), 1938
d-Amino-Acid Oxidase Systems Effect of Chlorpromazine upon Isolated (Dr Andrew Lasslo and Anne L Meyer), 1922
Amino-Acids A New Two-Dimensional Paper Chromatographic Method applied to the Separation of (C S Knight), 1486
Amino-Acids of α-Casein The N-Terminal (Dr W Manson), 1393
Amino-Acids of Red Sulphur Bacteria (H Mukherjee), 1742
Amino-Acids from Sucrose Biosynthesis of some, by Germinating Uredospores of Wheat Stem Rust, Race 15*B* (B Kasting, A J McGinnis and W C Broadfoot), 1943
Amino-Acids (2 4-Dinitrophenyl) Detection of, on Paper Chromatograms (Dr A H Maddy), 1397
Amino-Acids and Amides (Carbon-14-labelled) Translocation of, in the Stems of young Soya Bean Plants (C D Nelson and P R Gorham), 855
Amino-Acids and Peptides on Paper A Two-Dimensional System for the Separation of (Virginia Richmond and Brian S Hartley), 1859
β-Amino-*iso*butyric Acid in Mongolism Urinary Excretion of (Dr Thomas L Perry, Dr Kenneth N F Shaw and Dr Dorothy Walker), 1970
β-Amino-*iso*butyric Acid Excretors High Prevalance of High-Level, in Micronesians (Dr B S Blumberg and Dr S M Gartler), 1990
α-Amino-β-(pyrazolyl-N) Propionic Acid, a New Amino-Acid from *Citrullus vulgaris* (Water Melon), (Dr F F Noe and Dr L Fowden), B A 69
Amino- and other Organic Acids Two-Dimensional High-Voltage Paper Electrophoresis of (Dr D Gross), 1298
Aminoaciduria caused by Maleic Acid Significance of Lactose in the Diet in (Stefan Angielski and Jerzy Rogulski), 276
α-Aminoadipic Acid Enzymic Reduction of, by Yeast Enzyme (S Sagisaka and Prof K Shimura), 1709
p-Aminobenzoic Acid Antagonism of the Oxidative Dissimilation of, by *p*-Aminosalicylic Acid (Prof Norman N Durham and Jerry S Hubbard), 1398
γ-Aminobutyric Acid Quantitative Changes in, induced by Low Temperature in Rice Plants (F Zsoldos), 280
γ-Aminobutyric Acid Content of Rat Brain Increase in the, after Ingestion of Ethanol (Dr H -M Hakkinen and E Kulonen), 726
2-Aminoethane Phosphonic Acid Isolation of, from Rumen Protozoa (Masaaki Horiguchi and Makoto Kandatsu), 901
2-Aminofluorene Possible Relation between Carcinogenicity and Ease of Hydrolysis *in vitro* of Derivatives of (Prof Mary F Angus and Francis E Ray), 2018
1-*p*-Aminophenoxy-5-phthalimidopentane Loss of Wool in Sheep caused by (Dr D L Hughes), 1644
p-Aminosalicylic Acid Antagonism of the Oxidative Dissimilation of *p*-Aminobenzoic Acid by (Prof Norman N Durham and Jerry S Hubbard), 1398
Ammonia Inhibition of Reduced Diphosphopyridine Nucleotide Oxidation by (R T Wedding and H M Vines), 1226
Amoeba Biology of (Monica Taylor), 1371
AMPERE (Colloque), and the Radiofrequency Spectroscopy Group Joint Discussion on Molecular and Atomic Motions in Liquids and Solids by Radiofrequency Methods, 157
Amplitude-Modulation Radio-Telemetry of Nerve Action Potentials (Roger M Morrell), 1129
Ampol Petroleum, Ltd Grant of £2,500 towards the cost of the third Summer School for Science Teachers of the Australian Nuclear Research Foundation, 1108
AMSOC's Mohole A Bore-Hole to the Earth's Mantle— (Gordon Lill and Willard Bascom), 140
Amylase by *Penicillium chrysogenum* Inhibitory Effect of Fungistatic Antibiotics on the Production of (Dr I Horvath and A Szentirmai), 57
An Foras Taluntais (The Agricultural Institute of Ireland) Dublin, 28
    Appointment of Dr T Walsh as director, 29
    Appointment of Dr L B O'Moore as chief of the Animal Production Division, 29
    Appointment of J J Byrne as chief of the Rural Economy Division, 29
    Award of junior postgraduate agricultural research scholarships, 1612
    Division of Plant Sciences and Crop Husbandry, 1847
Anaemic Dogs after Nephrectomy Disappearance of the Erythropoietic Factor from Plasma of (Dr Jean-Pierre Naets), 371
Anaerobiosis (Aerobiosis and) Fluorescence Measurements of Mitochondrial Pyridine Nucleotide in (Localization and Assay of Respiratory Enzymes in Single Living Cells), (Prof Britton Chance and Dr Bo Thorell), 931
Anaesthetic for Fishes Urethane as a Carcinogen and as an (Dr J N Ball and Prof P N Cowen), 370
Anaesthetized Dog 'Supercarbia' in the (Dr G R Graham, D W Hill and J F Nunn), 1071
Analgesic Identification of Phenazocine, a Potent New (Dr E G C Clarke), 451
Analogue (Histidine), of Hypertensin II Synthesis of a Protected Heptapeptide related to the (Dr D Theodoropoulos), 1634
Analogue (O-Phosphorylated) Action of Trypsin on α-Carbethoxy-L-lysyl-L-serylglycine and its (Dr D Theodoropoulos, H Bennich, G Folsch and Prof O Mellander) 187
Analogues (Purine and Pyrimidine) Effect of, on Reversion of a Tryptophan-requiring Strain of *Escherichia coli* (C O Doudney and F L Haas), 114
Analogues and Precursors (Nicotinamide) Reversal of Effects of 2-Substituted Thiadiazoles by (Dr Irwin H Krakoff, Corrine R Lacon and Dr David A Karnofsky), 1805
Analogy with Muscle Contraction Permanent Set, Supercontraction and Urea-Bisulphite Solubility—the Proton-Transfer Nature of some changes in Keratin and the (Dr P T Speakman), 339
Analyser (The Infra-Red Gas), as a Means of Measuring the Carbon Dioxide Output of Individual Insects (Dr A G Hamilton), 367
Analyser (Narrow-Band Spectrum) Observations of the Fine Structure of Enhanced Solar Radio Radiation with a (Oystein Elgaroy), 887
Analyses (Activation), of Six Trace Elements in Marine Biological Ashes Some (R Fukai and Prof W W Meinke), 815
Analysing the Development of Connective Tissue Diaphragms for (Prof Hans Selye), 701
Analysis Classical Chemical, *review* by Dr William I Stephen, 1756
    Clerical Salaries (1958), (Office Management Association), 698
    Colorimetric Methods of, including Photometric Methods (Dr Foster Dee Snell and Dr Cornelia T Snell, assisted by Dr Chester Arthur Snell), Vol 2A, *review* by J King, 1522
    Food, *review* by Dr V H Booth, 1347
    Genetic, *review* by J Maynard Smith, 752
    Linear Structural (Prof P B Morice), *review* by R K Livesley, 1600
    Nuclear Energy and, *review* by G W C Milner, 1524
    Radioactivation (International Atomic Energy Agency and the International Council of Scientific Unions Symposium on), 951
    Soil Chemical (Prof M L Jackson), *review* by J M Bremner, 1093
Analysis of Kinetics and Mechanism Behaviour of Enzymes, an (Dr John M Reiner), *review* by Dr J B Chappell, 388
Analysis of Light Hydrocarbons (G R Primavesi), 2010
Analysis for Magnesium in High-Purity Aluminium (C A Youngdahl and F E DeBoer), 54
Analysis of Noise and Vibration New Techniques in the (Acoustics Group of the Physical Society and the Institute of Physics Symposium on), 415
Analysis of Permanent Gases by Gas Chromatography using a Radioactive Ionization Type Detector (V Willis), 894
Analysis of Satellite Orbits Density of the Upper Atmosphere from—Further Results (D G King-Hele), 1267
Analysis (Chemical), of Foods and Food Products (Dr Morris B Jacobs), third edition, *review* by Dr V H Booth, 1347
Analysis (Classical) Linear Operations and, *review* by Prof L S Goddard, 1763
Analysis (Contour), in Equatorial Meteorology Value of (D H Johnson and Dr H T Morth), 1372
Analysis (Differential), of the Effects of Phenothiazine-Tranquillizers on Emotional and Motor Behaviour in Experimental Animals (Dr M Taeschler and Dr A Cerletti), 823
Analysis (Functional) Introduction to (Prof Angus E Taylor), *review* by Prof T A A Broadbent, 666
Analysis (Genetic) Trends in (Prof G Pontecorvo), *review* by J Maynard Smith, 752
Analysis' ('*LO*-), as an Aid in the Study of Fungal Spore Morphology (Dr M M Payak), 738
Analysis (Neutron Activation) Determination of Chlorine in Muscle Tissues by (Dr Jonas Bergstrom), 1504
Analysis (Numerical), and Partial Differential Equations (George E Forsythe and Paul C Rosenbloom), *review* by Prof T A A Broadbent, 576
Analysis (Post-Exposure), of Organic Compounds in the Blood by a Rapid Infra-red Technique (Dr R D Stewart, D S Erley, T R Torkelson and C L Hake), 192
Analysis (Proximate), of Marine Standing Crops (Dr T R Parsons and Dr J D H Strickland), 2038
Analysis (Structural) Matrix Algebra in, *review* by R K Livesley, 1600
Analysis (Structure), and Experimental Techniques (Institute of Physics Conference on), 857
Analysis (Titrimetric) Nomenclature in (Committee of the Analytical Chemistry Section of the International Union of Pure and Applied Chemistry), 1686
Analysis and Probability Some Aspects of (Irving Kaplansky, Marshall Hall, Jr, Edwin Hewitt and Robert Fortet), *review* by D G Kendall, 214
Analytic Theory of Numbers Some Recent Progress in the (Prof H Davenport), 1533
Analytical Chemistry (edited by M T Kelley), Vol I, *review* by G W C Milner, 1524
Analytical Chemistry (A G Jones), *review* by Dr A M G Macdonald, 1677
Analytical Chemistry Advanced (Prof Louis Meites and Prof Henry C Thomas), *review* by Dr W I Stephen, 1525
    Comprehensive (edited by Prof Cecil L Wilson and David W Wilson), Vol Ia Classical Analysis, *review* by Dr William I Stephen, 1756
    Talanta Medal for outstanding contributions to, 956

Analytical Chemistry at Birmingham, 679
Analytical Chemistry in Nuclear Reaction Technology Third Conference on, 26
Analytical Measurements, Ltd Analytical Pocket *p*H Meter, 683
Analytical Pocket *p*H Meter (Analytical Measurements, Ltd), 683
Anastomoses (Vein), in the Leaves of Long Shoots of *Ginkgo biloba* (Dr Howard J Arnott), 1336
Anastomosis Establishment of Parenchymatous Spleno-Pulmonary Venous (Dr George R Walker, Dr Paul Field and Dr Patrick E Conen), 703
Anatomy Renaissance, *review* by Dr A R Hall, 1761
Anatomy (Isagogae Breves), (Jacopo Berengario da Carpi), translated with an Introduction and Historical Notes by L R Lind, and with Anatomical Notes by Paul G Roofe, *review* by Dr A R Hall, 1761
Anatomy and Biology The Wistar Institute of, Philadelphia (Dr R E Billingham and Dr H Koprowski), B A 6
Ancient Buildings, Society for the Protection of (Central Council for the Care of Churches and the) Report on the Conservation of English Wall-paintings, 1119
Ancient Egyptian and Cnidian Medicine (Robert O Steuer and J B de C M Saunders), *review* by Dr Douglas Guthrie, 662
Ancient Near East Myth and Ritual in the (Prof E O James), *review* by Prof Norman W Porteous, 1972
Ancient Seas Determination of the Temperatures of, by the Measurement of the Oxygen Isotopes Ratio in Fossil Calcareous Organisms (Y A Birstein), 1025
Andenabhang Sudperus Ein neuer *Asthenes* (Aves, Furnariidae) von der Kuste und dem westlichen (Maria Koepcke), (Beiträge zur Neotropischen Fauna), *review* by Dr F A Turk 1177
Andengebietes Zur Kenntnis der Pseudoscorpioniden-Fauna des (Max Beier), (Beiträge zur Neotropischen Fauna), *review* by Dr F A Turk, 1177
Anders, Edward, and Limber, Dr D Nelson Origin of the Worzel Deep-Sea Ash, 44
Anderson, B A Survey of Soils in the Kongwa and Nachingwea Districts of Tanganyika, *review* by Dr R M S Perrin, 1901
Anderson, Sir David Retirement as director of the Royal College of Science and Technology, Glasgow, 151 , work of, 151
Anderson, Dr D J Appointed to the University of London readership in physiology in relation to dentistry at Guy's Hospital Medical School, 595
Anderson, E S Mutation in the Type-determining Phages of *Salmonella typhi*, 1822
Anderson, Prof J S Opening Address at the second Australian Spectroscopy Conference, 1195
  Appointed director of the National Chemical Laboratory, 1610 , work of, 1610
Anderson, Prof J S , and Klemperer, D F 'Thermal Regeneration' in the Nickel–Oxygen System, 899
Anderson, N F , and others An Improved Technique for Intravenous Injection of Newborn Rats and Mice, 1952
Anderson, W , and others Current Trends of Strontium-90, Strontium-89 and Caesium-137 Levels in Milk, 89
Anderson Hospital and Tumour Institute of the University of Texas Fourteenth Annual Symposium on Fundamental Cancer Research (Cell Physiology of Neoplasia), 1451
Andree, Richard V Selections from Modern Abstract Algebra, *review* by Prof T A A Broadbent, 301
Andrew, E R Molecular and Atomic Motions in Liquids and Solids by Radiofrequency Methods, 157
Andrew, Capt J At the Annual General Meeting and Conference of the Mathematical Association (The Southampton Port Operation and Information Service), 32
Andrew, Dr Warren Textbook of Comparative Histology, *review* by Dr T Kerr, 752
Andrewes, Dr C H , and others Myxomatosis—Present Position and Future Prospects in Great Britain, 1179
Andrews, Dr Donald H The Road to Knowledge (New Relationships between Art and Sciences), B A 8
Andrews, E D (Hart, L I , and) Effect of Cobaltic Oxide Pellets on the Vitamin B_{12} Content of Ewes' Milk, 1242
Andrysek, O (Liebster, J , and) Labelling of Rose Bengal with Iodine-131 by Radioactive Exchange, 913
Anemia phyllitides Control of Antheridium Formation in the Fern Species (Dr Ulrich Naf), 798
Anemone (The Sea), *Calliactis parasitica*, and the Hermit Crab (*Eupagurus bernhardus*), (Dr D M Ross), 1161
Aneuploid Deoxyribonucleic Acid Content of Human Carcinomas (H F Stich and H E Emson), 290
Anfinsen, jun , Dr C B *Obituary* of Prof Kaj U Linderstrøm-Lang, 314
Angel, A , and others Fusion Frequency and Light Quantity, 1873
Angielski, Stefan, and Rogulski, Jerzy Significance of Lactose in the Diet in Aminoaciduria caused by Maleic Acid, 276
Anglesey The County of—Soils and Agriculture (E Roberts), (Memoirs of the Soil Survey of Great Britain—England and Wales), (Agricultural Research Council), 154
Angola Native Life in, 236
Anguilla vulgaris Turt Discrimination between Ebb and Flood Tide in Migrating Elvers, by means of Olfactory Perception (F Creutzberg), 1961
Angus, Capt K C Oil Pollution of the Sea (Preventive Measures taken by the Canadian Government), 950
Anhydrase (Carbonic), in the Deciduoma of the Rat (Dr T H Johnson, Dr C Lutwak-Mann and Prof M C Shelesnyak), 961
Anhydrase (Carbonic), in Erythrocytes Influence of X-Rays on the Activity of, and on their Haemolytic Resistance (A Lauwers, J Van Bavinchove and W Dierick), 111
Anhydrite (Insoluble) Transition of Calcium Sulphate Hemihydrate to (Chikara Mitsuki and Masayoshi Kita), 1481
Anhydrous Aluminium Chloride A New Method for Working up Processing Mixtures containing (Dr T Szell and A Furka), 117, *erratum*, 595
Anhydrous Formic Acid Action of, on Peptides and Proteins (H Kienhuis, G Blasse and J Matze), 2015
Aniba Aubl (Genus) Phylogeny of the—a Comparative Morphological and Chemical Observation (Walter B Mors, Otto Richard Gottlieb and Ida de Vattimo), 1589
Animal Behaviour (Dr John Paul Scott), *review* by Dr F Fraser Darling, 302
Animal Clocks (British Association for the Advancement of Science, Section D (Zoology), Symposium on), 763, 1534
Animal Ecology Practical (W H Dowdeswell), *review* by Prof J B Cragg) 1262
Animal Health Trust Awards for 1959-60, 771
  H M the Queen to become patron of the, 1190
Animal Joints Mechanism of—Sponge-hydrostatic and Weeping Bearings (Dr C W McCutchen), 1284 , Experimental Evidence for Weeping Lubrication in Mammalian Joints (P R Lewis and Dr C W McCutchen), 1285
Animal Life South African—Results of the Lund University Expedition in 1950-1951, Vol 5, (edited by Bertil Hanstrom, Per Brinck and Gustaf Rudebeck), *review*, 133
Animal Organism Thiosulphate Metabolism in the (Prof Boleslaw Skarzynski, Tadeusz W Szczepkowski and Miroslawa Weber), 994
Animal Populations Exploitation of Natural (British Ecological Society Symposium on), 1451
Animal Research at the Commonwealth Scientific and Industrial Research Organization, 1532
Animal Tissue Extracts Occurrence and Quantitative Determination of 2-Dimethylaminoethanol in (Dr Conrad G Honegger and Ruth Honegger), 550, *erratum*, 1986
Animal Viruses Inactivation of some, by Hydroxylamine and the Structure of Ribonucleic Acid (Dr Richard M Franklin and Dr Eberhard Wecker), 343
Animal World of Netherlands New Guinea (Dr L D Brongersma), *review* by J E Hill, 1251
Animals Orientation of, to Polarized Light (Dr H Kalmus), 228
  Parasitic (Dr Geoffrey Lapage), second edition, *review* by Dr C A Wright, 1011
Animals in East Africa Looking for (E H Tong), 1535
Animals to survive Freezing at an Extremely Low Temperature Prefreezing as a Method enabling (Eizo Asahina), 1003
Animals in Hiding (D G Lambert), 1535
Animals (Control and Stimulated) Quantitative Assay of Compounds in Isolated, Fresh Nerve Cells and Glial Cells from (Prof Holger Hyden), 433
Animals (Domestic) Reproduction in (edited by H H Cole and P T Cupps), Vol I, *review* by Dr S J Folley, 1091
Animals (Experimental) Differential Analysis of the Effects of Phenothiazine-Tranquillisers on Emotional and Motor Behaviour in (Dr M Taeschler and Dr A Cerletti), 823
Anion Role of the, in Magnesium Uptake from Foliar Applications of its Salts on Apple (M Allen), 995
Anion Exchangers based on Cellulose (Dr A O Jakubovic), 1065
Anionic Derivatives of Synthetic Polyglucoses Reduction of Toxicity of Cationic Macromolecules by Complexing with (P T Mora, B D Young and M J Shear), 431
Anisotropy (Diamagnetic), in Crystals Intermolecular Distances and, as Measures of the Polarity of Benzene and Borazole Substituents (Dame Kathleen Lonsdale), 1060
Anisotropy (North–South), and Anticipatory Increase of Intensity associated with the Cosmic-Ray Storm of February 11, 1958 (Dr V Sarabhai and R Palmeira), 1204
Annau, E Preparation of a Highly Purified Carbohydrate-free Johnin Protein, 1642
Annealing of Recoil Damage by Ultra-Violet Light (R F C Claridge and Dr A G Maddock), 1932
Annison, E F , and Lewis, D Metabolism in the Rumen, *review* by Dr D P Cuthbertson, 839
Anno, Toshinobu Awarded a Japanese Fellowship in Chemistry for 1959-60 by the Ramsay Memorial Fellowships Trustees, B A 16
Annual Review of Entomology, Vol 4 (edited by Edward A Steinhaus and Ray F Smith), *review* by Dr P T Haskell, 489
Annual Review of Pharmacology, 943
Annual Review of Physiology (edited by Victor E Hall, in association with Frederick A Fuhrman and Arthur C Giese), Vol 21, *review* by Prof D C Harrison, 838
Anoestrus Period of Laboratory Cats Reduction in the, by Increased Illumination (Dr Patricia P Scott and Marny A Lloyd-Jacob), 2022
Anomalies in the Behaviour of the F2 Layer of the Ionosphere Two (Sheila Croom, Audrey Robbins and J O Thomas), 2003
Anomalous 'Common Strontium' in Granite (W Compston and Dr P M Jeffery), 1792
Anomalous Continuum Radiation from Jupiter (Dr Eugene E Epstein), 52
Anomalous Genetic Interactions observed in *Bacillus subtilis* (M Kohiyama and Y Ikeda), 208
Anoplotermes (New Neotropical Element), in Indian Termite Fauna (Dr M L Roonwal and O B Chhotani), 1967
Ansell, Dr G R A Biochemist's Guide to the Nervous System, *review*, 1261
Antagonism of the Oxidative Dissimilation of *p*-Aminobenzoic Acid by *p*-Aminosalicylic Acid (Prof Norman N Durham and Jerry S Hubbard), 1398
Antarctic Natural Remanent Magnetization of Pre-Cambrian Gneiss of Ongul Islands in the (T Nagata and Y Shimizu), 1472
  Research in the, during 1960 (Sir Vivian Fuchs), 851 , American Programme, 852
  An Unusual Diatom from the (E J Ferguson Wood), 1962
Antarctic Party, British, 1985
Antarctic Glacier Ice Creep Tests on (Malcolm Mellor), 717
Antarctic Ice Sheet Surface Topography of the (Dr J F Nye), 786
Antarctic Snow Samples Oxygen Isotope Variations in (Dr R Gonfiantini and Prof E Picciotto), 1557
Antarctic Stations (New Zealand) Diurnal Variation of Aurora and Geomagnetic Disturbance at (Dr T Hatherton and G G Midwinter), 889
Antarctica Fossil Pollen from Seymour Island (Lucy M Cranwell), 1782
  Palaeomagnetism of some Dolerite Intrusions from the Theron Mountains and Whichaway Nunataks, (D J Blundell and P J Stephenson), 1860
Anterior Pituitary Gland A Dense Laminar Structure found in Conjunction with Cell Membranes in the (Barbara G Barnes), 651

Anterior Pituitary-like Activity of Rumen Contents (Dr F A Soliman), 1723
Anthelminthic Property of *Artemesia monosperma* grown in Egypt *In vitro* Study of the (A Sharaf, Z F Ahmed and F Abdel Moneim), 647
Antheridium Formation in the Fern Species *Anemia phyllitides* Control of (Dr Ulrich Naf), 798
Anthony, Dr H D Science and the Humanities, *review*, 131
Anthropologist at Work An—Writings of Ruth Benedict (Dr Margaret Mead), *review* by Prof E E Evans-Pritchard, 301
Anti-A Haemagglutinins from a Non-Leguminous Plant, *Hyptis suaveolens* Poit (Dr G W G Bird), 109
Anti-Atherogenic and Endocrine Actions The C_{17}-OH Group of Œstradiol—Relationships between its (Dr Manuel Rene Malinow, Alvaro L Gimeno, Amanda A Pellegrino-Iraldi, Martha A Fernandez-Gimeno, Jorge L Lacuara and Jaime A Mogu'levsky), 1720
Antiadrenergic Compounds New (A L A Boura, F C Copp and A F Green), B A 70
Antibacterial Substances of Coniferous Seedlings at Different Stages of their Development (R Vamos and L Vida), 915
Antibiotic Monamycin, a New (Prof C H Hassall and K E Magnus), 1223
  A New Trichothecin-like Antifungal (E T Glaz, Eszter Scheiber, J Gyimesi, I Horvath, Katalin Steczek, A Szentirmai and G Bohus), 908
Antibiotic Production as a Function of Spore Formation in *Bacillus licheniformis* (Robert W Bernlohr and G D Novelli), 1256
Antibiotics Neuromuscular Blocking Action of some (G Bezz and G L Gessa), 905
Antibiotics (Fungistatic) Inhibitory Effect of, on the Production of Amylase by *Penicillium chrysogenum* (Dr L Horvtah and A Szentirmai), 57
Antibodies (Incomplete) Loss of Plasticity of Erythrocytes coated with (Prof C T Nicolau, P Teitel and M Fotino), 1808
Antibodies (Thyroid) Detection of, using Bentonite Particles (Dr J A M Ager, Dr M S R Hutt and G Smith), 478
Antibody Recovery of Infectious Nucleic Acid from Tobacco Mosaic Virus inactivated by (Dr Irving Rappaport), 1732
Antibody (Agglutinating Auto-), (Panagglutinin) Production of an, Active upon Tanned Erythrocytes in the Rabbit (P O Hubinont, P Ghysdael and O Thys), 1250
Antibody (Precipitating) Promoting Effect of Urea on the *in vitro* Passive Sensitization of Isolated Plain Muscles with (R Binaghi, Dr B N Halpern, P Liacopoulos and T Neveu), 1805
Antibody and Complement Release of Compounds containing Diaminopimelic Acid from *Vibrio metchnikovi* treated with (Dr F Shafa and Dr M R J Salton), 1341
Antibody Formation Specific Inhibition of, during Immunological Paralysis and Unresponsiveness (Dr E Sercarz and Dr A H Coons), 1080
Antibody Globulin *In vitro* Labelling of, by Tritium Exchange (Dr P C Rajam and Anne-Louise Jackson), 375
Antibody Status of Mice and Response of their Litters to Parotid Tumour Virus (Polyoma Virus), (Lloyd W Law, Clyde J Dawe, Wallace P Rowe and Janet W Hartley), 1420
Anticipatory Increase of Intensity associated with the Cosmic-Ray Storm of February 11, 1958 , North–South Anisotropy and (Dr V Sarabhai and R Palmeira), 1204
Anticoagulant (Bridge Blood) Neutralization of (Dr F Nour-Eldin), 1419
Anticoagulant Activity of Human Arterial Mucopolysaccharides (Prof John E Kirk), 369
Anti-coagulant Drug Pelentane or Thromexane Isomeric O-Methyl Ethers of Ethyl di-(4-hydroxycoumarinyl-3)-Acetate, the (Dr Eduard Knobloch), 1568
Anticoagulating System (Physiological) Interellations between the Blood Coagulating System and the (Prof P A Kudrjashov), 454
Antidiuretic Effect of Vasopressin Mechanism of the (Dr Tsutomu Kashiwagi), 991
Antifungal Antibiotic A New Trichothecin-like (E T Glaz, Eszter Scheiber, J Gyimesi, I Horvath, Katalin Steczek, A Szentirmai and G Bohus), 908
Antifungal Substance, 6-Methoxybenzoxazolinone Isolation of the, from Field Corn (*Zea mays L*) in Canada (N J Whitney and C G Mortimore), 1320
Antigen Js^a (New Blood Group), among South American Indians Frequency of the (Dr Miguel Layrisse and Dr Zulay de Layrisse), 640
Antigen Sw_a A 'New' Human Blood Group (T E Cleghorn), 1324
Antigenic Components from Isolated Nuclei Transplantation Immunity—Separation of (Andre Castermans and Andre Oth), 1224
Antigenic Substances Coating of Red Blood Cells with (Dr K Deutsch), 278
Antigens (*Iso-*), of Rabbit γ-Globulin (S Dubiski, Danuta Skalba, Anna Dubiska and Dr A Kelus), 1811
Anti-Knock Mechanism of (Dr A B Callear and Prof R G W Norrish), 1794
Antileukaemic Activity of Polyporic Acid (J F Burton and B F Cain), 1326
Antilipaemic X Factor of the Unsaponifiable Fraction of Crude Vegetable Oils Chromatographic Identification of the (Prof M C Nath, A Saikia and B I Uppin), 1635
Anti-Locust Research Centre, London Appointment of Dr P T Haskell as deputy director, 410
Antimetabolic Action of Vitamin K (Prof E Quagliariello, C Saccone, E Rinaldi and M R Alioto), 820
Antimetabolites (New), from Vitamin B_{12} (G M Timmis and Dr S S Epstein), 1383
Antimineralocorticoid Action of some Saluretic Sulphonamides (Dr G C Kennedy and Dr J D Crawford), 1492
Anting, *review* by T H Hawkins, 665
Antiquities Chemistry in the Preservation of (British Association for the Advancement of Science, Sections B (Chemistry) and H (Anthropology) Discussion on), 585
Anti-Rh Serum Specific Inhibition of, by 'Unnatural' Sugars (Dr William C Boyd, Marjorie H McMaster and Eugenia Waszczenko-Zacharczenko), 989
Anti-Shielding Factor (Quadrupole), in Copper (E A Faulkner), 442
Anti-Staling Agents Interaction of, with Starch (Prof E J Bourne, A I Tiffin and Dr H Weigel), 547
Antiviral Chemotherapeutic Activity of Isatin β-thiosemicarbazone in Mice infected with Rabbit-pox Virus (D J Bauer and F W Sheffield), 1496
Ants and Form Reversal in Aphids (Dr Bruce Johnson), 740
Aorta (Dorsal), of certain Fishes , A Ligament in the (Dr L L de Kock and Dr S Symmons), 194
Aphids Ants and Form Reversal in (Dr Bruce Johnson), 740
Apices (Root) Reorganization of, after Irradiation (F A L Clowes), 1025
Apinis, Dr A E Mapping Vegetation, B A 23
Apis mellifica (L) Isolation of 24-Methylene-cholesterol from Honey Bees (Dr M Barbier, Prof T Reichstein, Dr O Schindler and Prof E Lederer), 732
Aplacophorous Mollusc *Neomenia carinata* Tullberg Development of the (Dr T E Thompson), 122
Apo- and Co-dehydrogenases Interaction of Streptomycin and Dihydrostreptomycin with (Prof K Michalska), 987
Apo-Protein (D-Amino-Acid Oxidase) Binding of the Sulphydryl Group in, with Flavin Adenine Dinucleotide (Dr Kunio Yagi and Takayuki Ozawa), 1227
Apo-Protein (D-Amino Acid Oxidase), and Benzoate Change of Absorption Spectrum of Flavin Adenine Dinucleotide by its Binding with both (Dr Kunio Yagi, Takayuki Ozawa and Minoru Harada), 1938
Apomict, *Aerva tomentosa* Forsk *In vitro* Culture of the Inflorescences, Flowers and Ovaries of an (Prem Murgai), 72
Apothecaries of London, Worshipful Company of Foundation of a Faculty of the History of Medicine and Pharmacy, 1448
  Inaugural Lecture to the Faculty of the History of Medicine and Pharmacy (Canon Charles E Raven), 1448
Apparatus (Electronic), for Biological Research (P E K Donaldson), *review* by W J Perkins, B A 4
Apparatus and Methods of Oceanography (Dr H Barnes), Part I, Chemical, *review* by F A J Armstrong, 299
Apparent Observation of Solar Corpuscular Clouds by Direct Continuous-Wave Reflexion (Dr John D Klaus and W Reed Crone), 965
Appearance of Crystalline Needles in Monkey Kidney Cell Cultures infected with Poliomyelitis Virus and Incubated at 22-30° C (Dr Esther Tenenbaum), 1657
Appearance of Granules in the Cytoplasm of Tumour-Cell Cultures in Contact with Lysozyme (Dr Carlo Callerio), 202, *erratum*, 508
Appearance of Mutants with Respiration-deficiency in *Staphylococci* Rate of (G V Gause, G V Kochetkova and N A Sorbaeva), 1821
Apple Role of the Anion in Magnesium Uptake from Foliar Applications of its Salts on (M Allen), 995
Apple Fruitlets A Kinin in (Dr P L Goldacre and Dr W Bottomley), 555
Apple Stem Wounds *Gloeosporium* in (R O Sharples), 243 , (A T K Cooke), 244
Apple Tissue Oxidation of Krebs Cycle Acids by (M D Hatch, J A Pearson, A Millerd and R N Robertson), 506
Apples Nature of the Olefines produced by (Dr F E Huelin and B H Kennett), 996, *errata*, 1535 , (Dr D F Meigh), 1072
Appleton, Sir Edward Photography in the International Geophysical Year, 1032
Application of Biometrical Genetics to Behaviour in Rats (Dr P L Broadhurst), 1517
Application of the Mass Spectrometer to Polysaccharide Chemistry (Dr F A Finan and Dr R I Reed), 1866
Application of Science in Industry, 1827
Application to the Study of Rat Adrenal Lipids Use of Porter–Silber and Schiff Reagents as Spot Tests for Steroids applied on Paper and their (Dr Marion K Birmingham), B A 67
Application of Ultra-Violet Lights to Underwater Research (Richard G Woodbridge, III, and Dr Richard C Woodbridge), 259
Application of Warburg's Equation to Tissue Slices (Dr I S Longmuir and Dr Ann Bourke), 634
Applications Computer (Report of the Proceedings of the fifth Annual Symposium on), 771
Applications of Insecticides New Pests of Cocoa (*Theobroma cacao* L) in Ghana following (P F Entwistle, C G Johnson and E Dunn), 2040
Applications of Paper Chromatography to Systematics—Recombination of Parental Biochemical Components in a *Baptisia* Hybrid Population (Dr R E Alston and Dr B L Turner), 285
Applications of Statistics in Physics, *review* by Dr H Steeple, 664
Applications (Foliar), of its Salts on Apple Rôle of the Anion in Magnesium Uptake from (M Allen), 995
Applications (Tracer), for the Study of Organic Reactions (John G Burr, Jr), *review* by Dr A I Scott 1902
Applied Bacteriology, Society for Election of Officers, 683
Applied Chemistry (Pure and), International Union of Meeting of the Commission on Geochemistry, 1193
  Election of members of the Commission on Geochemistry, 1193
  Election of Prof C W Correns as president for 1960 of the Commission on Geochemistry, 1193
Applied Chemistry (Pure and), International Union of (Committee of the Analytical Chemistry Section) Nomenclature in Titrimetric Analysis, 1686
Applied Chemistry (Pure and), International Union of (Commission on Macromolecules) International Symposium on Macromolecules, 1689
Applied Chemistry (Pure and) International Union of (Deutsche Bunsen Gesellschaft fur Physikalische Chemie and the) Symposium on Thermodynamics, 1606
Applied Mathematics at Cardiff 591
'Applied' Mathematics Surveys in, *review* by D G Kendall, 214
Applied Mathematics and Theoretical Physics at Cambridge, 686
Applied Mechanics Theoretical and, (Indian Society of Theoretical and Applied Mechanics Fifth Congress on), 1192
Applied Mechanics (Theoretical and), Indian Society of Fifth Congress on Theoretical and Applied Mechanics, 1192
Applied Microscopy and Photomicrography (H M Malies), *review* by Dr S Bradbury, 1174
Applied Physics at Durham, 1022
Applied Polymer Science, Journal of, Vol I, No I, 784
Approach (A Molecular), to the Problem of Viscoelasticity (Prof Alfred H Nissan and H G Higgins), 1477
Approach (A New), to Carbon Gasification (J D Blackwood and F K McTaggart), 447
Approach (A New), to the Dating of the Dead Sea Scrolls (Prof D Burton, J B Poole and Dr R Reed), 533

Approach (A New), to Immunity, *review* by Dr J H Humphrey, 753
Approach (A New), to the Mechanism of Mutations (Prof Paul Mandel and Pierre Chambon), 1501
Approach (A New), to Schizophrenia (Dr Julius I Steinfeld), *review* by Prof Martin Roth, 487
Approach (A New), to Schizophrenia (Dr Julius I Steinfeld), *review* by Prof Martin Roth, 487
Aqueous Extracts of Excised Tomato Roots Nitrate Reduction by (C S Vaidyanathan and Prof H E Street), 531
Aqueous Polymer Phase Systems Counter-Current Distribution of Proteins in (Per-Ake Ålbertsson and Ed Jacques Nyns), 1465, *erratum*, 1688
Aqueous Systems Solid State Rheological Study of the Mechanism of Paraffin-Detergent Interactions in (F J Radd and L H Crowder), 443
  Strength Impairment Mechanism of Glass in (Frederick J Radd and Donald H Oertle), 976
Arabinose and some other Sugars Discrimination of Xylose from (B Drozdz), 1395
Arabis Mosaic Virus Rôle of a Dagger Nematode (*Xiphinema* sp) in Outbreaks of Plant Diseases caused by (Dr B D Harrison and Dr C H Cadman), 1624
Aragon de la Cruz, Dr F (MacEwan, Dr D M C , and) Phase Transitions in Interlamellar Films, 1859
Arai, Hideo, and others Microbiological Transformation of a Cardiac Aglycone, 469
Arai, Ken-ichi, and others Changes in Purine Nucleotides of Red Lateral Muscle of Rainbow Trout, 1415
Aramaki, Shiger, and Roy, Prof Rustum Revised Equilibrium Diagram for the System Al_2O_3-SiO_2, 631
Arbuscular Organs (Fungal) Production of, on Laboratory Media (G A Atkins), 1738
Archaeological Investigations (Preliminary), in the Sierra de Tamaulipas, Mexico (Dr Richard S MacNeish), 593
Archer, B L , and others Incorporation of DL-[2-^{14}C] Mevalonic Acid Lactone into Polyisoprene, 268, *erratum*, 772
Archer, Dr G T Release of Histamine from Rat Mast Cells by Blood treated with Dextran, 1151
Archer, Sylvia M , and others Culture of Algae and other Micro-organisms in Deuterium Oxide, 729
Architects, New Zealand Institute of (New Zealand Master Builders' Federation and the) Establishment of a Building Research Bureau, 235
Arcs (Low-Voltage) Emission of Relatively High-Energy Ions from (E R Harrison), 245
Arctic A Flora of the, *review* by R D Meikle, 1347
Arctic Flora Circumpolar (Dr Nicholas Polunin), *review* by R D Meikle, 1347
Arctic North America The Benthos of Soft Sea-bottom in (Dr D V Ellis), B A 79
Arenicola marina (L) Local Races in Lugworms (Dr A Ducan), 71
Argillite Haida Carvers in (Prof Marius Barbeau), 409
Arginase Inhibitor Uraemia and its Treatment by (Dhruba K Sen), 459
Arginine Vasotocin (Active Principles of the Neurohypophysis of Cold-blooded Vertebrates), (Panayotis G Katsoyannis and Prof Vincent du Vigneaud), 1465
Arginine Vasotocin and Oxytocin in Neurohypophysial Extracts from Cold-blooded Vertebrates Pharmacological Evidence for the Presence of (Active Principles of the Neurohypophysis of Cold-blooded Vertebrates), (Wilbur H Sawyer, Robert A Munsick and Prof H B van Dyke), 1464
Argonne National Laboratory Zero Gradient Synchrotron, 503
Argus, Prof Mary F , and Ray, Francis E Possible Relation between Carcinogenicity and Ease of Hydrolysis *in vitro* of Derivatives of 2-Aminofluorene, 2018
Arigoni, Dr D Steric Aspects of the Chemistry and Biochemistry of Natural Products (Steric Aspects of the Biosynthesis of Terpenes and Steroids), 947
Arimura, Akira, and Dingman, Prof Joseph F Specific and Sensitive Assay Method for Vasopressin and Oxytocin using Glass-Paper Chromatography, 1874
Armco Iron Dynamic and Static Deformation of (H P Tardif and P Chollet), 1917
Armitage, Dr P , and others Dose-Response Relationship in Radiation Leukaemia, 1669
Armstrong, D L Chemistry of Propellants (Characteristics of Liquid Propellants desired and achieved in Rocket Engines), 778
Armstrong, Brigadier, E F E Nature Conservation and Youth Service in Britain, 685
Armstrong, F A J Chemical Oceanography, *review*, 299
Armstrong, J J , and others Teichoic Acids from Bacterial Walls—Composition of Teichoic Acids from a Number of Bacterial Walls, 247 , Structure of Teichoic Acid from the Walls of *Bacillus subtilis*, 248
Arnold, Dr A H M Title of professor of electrical engineering in the University of London (at King's College) conferred on, 1535
Arnold, C A , and Lowther, J S Origin and Dispersal of Flowering Plants (Low Representation of Angiosperms in two American Cretaceous Floras), 1201
Arnon, Prof Daniel I Conversion of Light into Chemical Energy in Photosynthesis, 10, *errata*, 1613
Arnott, Dr Howard J Vein Anastomoses in the Leaves of Long Shoots of *Ginkgo biloba*, 1336
Aromatic Compounds Hydrogenolysis of Carbon-Oxygen Bonds in some, by Electrolysis (Dr P H Given and Dr M E Peover), 1064
Aromatic Hydrocarbons (Polycyclic) Effect of, on the Polarographic Maximum of Copper (C E Searle), 1716
Aromatic Ring Opening in the Presence of Oxygen in Irradiated Solutions (Israel Loeff and Gabriel Stein), 901
Aromatic Substitution—Nitration and Halogenation (Dr P B D de la Mare and J H Ridd), *review* by Prof M J S Dewar, 925
Arrangements (Dislocation), in Molybdenum (J F Kerridge, A A Johnson and H I Matthews), 356
Arrowsmith, J R Ergonomics, its Place in Industry, B A 21
Arsenic-resistant and Sensitive Strains of the Blue Tick, *Boophilus decoloratus* Contents of Cystine-Cysteine, Glutathione and Total Free Sulphydryl in (Dr J S Harington), 1739
Artemia (Genus) Occurrence of Neoteny in the (Inder Chand Baid), 73
Artemesia monospermia grown in Egypt *In vitro* Study of the Anthelminthic Property of (A Sharaf, Z F Ahmed and F Abdel Moneim), 647
Arterial Mucopolysaccharides (Human) Anticoagulant Activity of (Prof John E Kirk), 369
Arthrobacter Taxonomic Position of (Dr C S Cummins and Dr H Harris), 831
Arthur, Dr D R Appointed reader in zoology at King's College, London, 1613
Arthur (James) Lecture on the Evolution of the Human Brain—The Discrete and the Diffuse in Nervous Action (Prof D P C Lloyd), 1777
Artificial Organs—Biological Applications (Prof A Hemingway), B A 45
Artman, M (Bekierkunst, Dr A , and) Effect of Cell-Free Extracts from *Mycobacterium tuberculosis* $H_{37}Rv$ on Lung Succinooxidase, 458
Arts Help for the (Calouste Gulbenkian Foundation), 699
Arts and Sciences, American Academy of Election of New Fellows and Foreign Honorary Members, 409
  Re-election of Dr Kirtley F Mather as president, 410
Arvegwitch, Dr W I Photography in the International Geophysical Year (Photo-topographic Methods for the Study of Glaciers), 1032
Arylesterase of Human Serum Activation and Inhibition of the (Prof E G Erdos, C R Debay and M P Westerman), 430
Asahina, Eizo Prefreezing as a Method enabling Animals to survive Freezing at an Extremely Low Temperature, 1003
Asbestos Dust Concentrations Measurement of, with the Long-Running Thermal Precipitator (Dr C G Addingley and Dr R Gaze), 715
Ascaris lumbricoides Electrical Activity in the Muscle Cells of (Dr M Jarman), 1244
Ascites Carcinoma (Ehrlich) Effect of Chlorpromazine on Crocker Sarcoma and (Prof M Chorazy), 200
Ascites Tumour (Ehrlich) Ribonucleases of Mouse Tissues and of the (K A O Ellem, J S Colter and Jeanne Kuhn), 984
Ascites Tumour Cells (Intact) Efficiency of the Mitochondrial Oxidative Phosphorylations in (Dr P Emmelot and C J Bos), 2024
Ascites Tumour Cells (Mouse) Growth Inhibition of, by Powdered Tragacanth (Tragacanthae Pulvis, B P), (Dr E M F Roe), 1891
Ascoli, F , and others Influence of Counterion Association on the Configurational Stability of Deoxyribonucleic Acid in Solution, 1482
Ascorbic Acid Distribution of, in the Leaves of some Plants (Dr Philippe Hagene), 284
  Presence in Rose Hips of Substances Inhibiting the Oxidation of (Dr G A D Jackson and R B Wood), 902
Ascorbic Acid Biosynthesis Stimulatory Effect of Foreign Compounds on, and on Drug Metabolizing Enzymes (Dr A H Conney and Dr J J Burns), 363
Aseptic Conditions A Simplified Method for the Culture of *Blatella germanica* under (R B Clayton), 1166
Asexual Reproduction in the Enchytraeidae (Olig), (B Christensen), 1159
Ash (Worzel Deep-Sea) Origin of the (Edward Anders and Dr D Nelson Limber), 44
Ashby, Sir Eric Speaking at the Inaugural Meeting of the International Commission on Higher Education in Nigeria, 152
Ashes (Marine Biological) Some Activation Analyses of Six Trace Elements in (R Fukai and Prof W W Meinke), 815
Ashmore, Dr A Appointed to a senior lectureship in physics in the University of Liverpool, 410
  Appointed to the University of London readership in experimental physics at Queen Mary College, 595
Ashmore, Prof James, and others Liver Glucosyl Oligosaccharides and Glycogen—Carbon-14 Dioxide Experiments with Hydrocortisone, 1380
Ashton, Francis T A Method for the Quantitative Study of the Surface Precipitation Reaction, 1735
Ashton, G C β-Globulin Alleles in some Zebu Cattle, 1135
Ashwood-Smith, Dr M J , and others Radioprotective Action of Methoxiamine, 1729
Ashwood-Smith, Dr M J , and Smith, A D Rat Brain Glutathione and Pyridoxine Deficiency, 2028
Asia and the Far East School Meals in, 420
Asia (South and South-East) Bibliography of Scientific Publications of (Unesco Science Co-operation Office), Vol 5, No 6, 772
Asian Strains of Influenza Virus Serum Inhibitors of (Suzanne M James and Paul Fiset), 1656
Aspects of Analysis and Probability Some (Irving Kaplansky, Marshall Hall, Jr , Edwin Hewitt and Robert Fortet), *review* by D G Kendall, 214
Aspects of Magnetism Some (Institute of Physics Conference on), 322
Aspects of Solid State Physics, *review* by Prof E C Stoner, 1753
Aspects (Medical), of Complex Carbohydrates (Prof M Stacey), B A 42
Aspects (Mineralogical), of Soil Science (Welsh Soils Discussion Group Discussion on), 156
Aspects (Public Health), of Nuclear Energy Post-Graduate Training in the (World Health Organization, Technical Report Series No 154), 33
Aspects (Steric), of the Chemistry and Biochemistry of Natural Products (Biochemical Society Symposium on), 947
Aspergillus niger Effect of Sulphanilamide on Citric Acid Production by (K V Rajagopalar, R Radhakrishnamurthy and P S Sarma), 461
Aspirin and Algesimetry (Dr C V Winder), 494
Aspro-Nicholas, Ltd , Appointment of R Levin as development planning executive, 1192
Assay of Plasma Insulin in Human Subjects by Immunological Methods (Dr Rosalyn S Yalow and Dr Solomon A Berson), 1648
Assay of Respiratory Enzymes in Single Living Cells Localization and—Absorbancy Measurements on the *Nebenkern* (Dr Robert P Perry, Dr Bo Thorell, Dr Lennart Akerman and Prof Britton Chance), 929 , Fluorescence Measurements of Mitochondrial Pyridine Nucleotide in Aerobiosis and Anaerobiosis (Prof Britton Chance and Dr Bo Thorell), 931 , Absorbancy Measurements on Liver and Kidney Cells (Dr Bo Thorell and Prof Britton Chance), 934
Assay (Quantitative), of Compounds in Isolated, Fresh Nerve Cells and Glial Cells from Control and Stimulated Animals (Prof Holger Hyden), 433
Assay (Spectrophotofluorometric), of Griseofulvin (Carole Bedford, K J Child and E G Tomich), 364

- Assay Method (Specific and Sensitive), for Vasopressin and Oxytocin using Glass-Paper Chromatography (Akira Arimura and Prof Joseph F Dingman), 1874
- Assay Systems (Biochemical), involving Nitrite Estimation by Diazotization Measurement of Inhibition by Azide in (Dr E J Hewitt and D G Hallas), 1485
- Assay Systems (Biological) Interference by Azide with Diazotization Procedures used in (J R Villanueva), 549
- Assessment of the Phagocytic Activity of the Macrophage System (Prof D L J Bilbey and Dr H Salem), 992
- Assimilation (Nitrogen), of *Vicia villosa* Influence of Gibberellic Acid and Photoperiod on the Growth, Flowering, Nodulation and (the late Prof Margaretha G Mes), 2035
- Assistance for Under-developed Countries, 1363
- Associated with Noise Distribution of Flares on the Solar Disk (L R McNarry), 806
- Associated Electrical Industries, Ltd Inauguration of *Merlin* by H R H the Duke of Edinburgh, 1191
  - Sunvic Controls, Ltd , to combine with the Instrument and Meter, Scientific Apparatus and X-Ray Departments of Metropolitan-Vickers Electrical Co , Ltd , to form the Instrumentation Division of, 1535
- Association between Abo Blood Groups and Fertility in a Normal American Population (Dr T Edward Reed and Dr J H Ahronheim), 611
- Association between Colour of the Iris of the Eye and Reaction to Dental Pain (Dr Philip R N Sutton), 122
- Association of Radio Outbursts with Solar Flares (L D de Feiter, A D Fokker and J Roosen), 805
- Association (Counterion) Influence of, on the Configurational Stability of Deoxyribonucleic Acid in Solution (F Ascoli, C Botre, V Crescenzi, A Mele and Prof A M Liquori), 1482
- Astaxanthin Occurrence of, in the Flower Petals of *Adonis annua* L (A Seybold and Prof T W Goodwin), 1714
- Astbury, Dr N F Special Ceramics, 1115
  - Appointed director of the British Ceramic Research Association, 1843 , work of, 1843
- *Asthenes* (Aves, Furnariidae) von der Kuste und dem westlichen Andenabhang Sudperus Ein neuer (Maria Koepcke), (Beitrage zur Neotropischen Fauna), *review* by Dr F A Turk, 1177
- Aston, J G Thermodynamics (Phase Changes in Condensed Systems), 1609
- Astronautics Vistas in—First Annual Air Force Office of Scientific Research Astronautics Symposium (edited by Morton Alperin and Marvin Stern), *review* by D G King-Hele, 663
- Astronomers (Radio) International Conference of, *review* by Dr H P Palmer, 1755

Austen, Dr A E W , and Priede, Dr D Recent Studies of Noise Problems (Physical Acoustics—Diesel Engine Noise), 415
Austenitic Stainless Steel Chromium Distribution around Grain Boundary Carbides found in (B E Hopkinson and K G Carroll), 1479
Austern, Prof N Nuclear Forces and the Few-Nucleon Problem (Preliminary Calculations concerning the Structure of ^{6}Li and ^{12}C), 1114
Austin, E R Modern Network Theory in Electrical Engineering (Design and Construction of Filter Networks), 1692
Australia Atomic Energy in, 593
  Fencing Posts in (Commonwealth Scientific and Industrial Research Organization, Australia, Rural Research, 27), 321
  New Fossil Penguin from (G G Simpson), 1612
  Nuclear Research in, 1118
  Radiation Observations with Satellite 1958δ over (Dr A J Herz), Dr K W Ogilvie and J Olley, and R B White), 391
  Sporidesmium bakeri recorded from Victoria (B S Janes), 1327
Australia (South-western) Precambrian Geology of (A F Wilson), 237
Australian Academy of Science New Building of the, B A 10
  Selby Fellowship, 684
Australian Atomic Energy Commission Research Grants, 940
  Sixth Annual Report (1957-58), 1118
Australian Botanical Laboratory New, 1776
Australian Chemical Institute, Royal Election of C E C Nicholls as president, 1106
Australian Commonwealth Scientific and Industrial Research Organization
  Grant of 30,000 dollars from the Rockefeller Foundation, for special equipment for the new Division of Tropical Pastures, 93
  Grant of 100,000 dollars from the Rockefeller Foundation, for the Divisions of Plant Industry and of Entomology, 93
  Grant of 250,000 dollars from the Rockefeller Foundation, towards the cost of the radio telescope for the Division of Radiophysics, 93
  Formation of a Division of Mineral Chemistry, 237
  Appointment of Dr F W G White as chairman, 317
  Appointment of Dr R N Robertson as a full-time member of the Executive, 317
  Rural Research in C S I R O , 27, Fencing Posts in Australia, 321
  List of Divisions and Sections, 410
  Tenth Annual Report (1957-58), 1027
  Second Australian Spectroscopy Conference, 1195
  Symposium on the Structure and Chemistry of Proteins, 1276
  Retirement of D A Gill as chief of the Division of Animal Health and Production, 1532
  Appointment of Dr J M Rendel as chief of the Division of Animal Genetics, 1532
  Appointment of Dr T S Gregory as chief of the Division of Animal Health, 1532
  Appointment of Dr I W McDonald as chief of the Division of Animal Physiology, 1532
  Cunningham Laboratory of the, 1776
  Appointment of C S Christian and Prof L G H Huxley as members of the Executive, 1984
  Appointment of G B Gresford as secretary, 1985
  Appointment of W Ives as executive officer, 1985
Australian Defence Standards Laboratories Technical Memorandum 2, The Intensity of Infra-red Absorption Bands—a Bibliography (compiled by Dr R G Gillis), 682
  Annual Report for 1956-57, 782
Australian Environment Strontium-90 in the, 1957-58 (Dr F J Bryant, L J Dwyer, Dr J H Martin and Prof E W Titterton), 755
Australian Journal of Statistics (Statistical Society of New South Wales,) 504
Australian Mammal Society Inaugural Meeting, B A 16
Australian Museum Annual Report for 1957-58, 592
Australian Nuclear Research Foundation Third Summer School for Science Teachers, 1108
Australian Prehistory Dating of (D J Mulvaney), 918
Australian Scientific Research Development Trends in, 1027
Australian Spectroscopy Conference Second (Dr Norman S Ham), 1195
Authors Notes for (Institute of Physics), revised edition 95
Authors of the Reports of the United States Geological Survey Suggestions to, fifth edition, *review* by Prof C F Davidson, 390
Authors (Forty-seven), in Search of a Conclusion, *review* by N W Pirie, 920
Auto-Antibody (Agglutinating), (Panagglutinin) Production of an, Active upon Tanned Erythrocytes in the Rabbit (P O Hubinont, P Ghysdael and O Thys), 1250
Auto-Intoxication après Brûlure (R Godfraind), *review* by Dr S Sevitt, 5
Automatic Control, International Federation of Members of the Executive Council, 1450
Automation and Society (edited by Howard Boone Jacobson and Joseph S Roucek), *review* by R Brightman, 1438
Automobile Collisions Experiments on (Prof J H Mathewson), 237
Autoradiographed Radioactive Particles Electron Microscopy of (L A George, II , and G S Vogt), 1474
Autoradiography of Neutron-activated Sections Distribution of Sodium in Compact Bone, as revealed by (Prof J Vincent), 1332
Autoradiography of Tritium-labelled Compounds on Paper Chromatograms (Dr A W Rogers), 721
Autoradiography (Low-Temperature), for the Detection of Tritium in Tissue, with Removal of Luminescence induced by Tritium (P Pellerin, P Fallot, M Laine-Boszormenyi and F Serrel), 1385
Autoregulation of Renal Blood Flow Mechanism of (Dr Allen M Scher), 1322
l'Autosterilite du Cafeier robusta (*Coffee canephora* Pierre) , Recherchés sur (M Devreux, G Vallaeys, P Pochet et A Gilles), 518
Autumn Extended Dormancy of Deciduous Woody Plants treated in, with Gibberellic Acid (Dr P W Brian, J H P Petty and P T Richmond), 69
Auxin and the Bulbing of Onions (Dr J E Clark and Prof O V S Heath), 345
Auxin and Gibberellic Acid Effects of, on Growth of *Ulothrix* (Dr Herbert Conrad, Dr Paul Saltman and Dr Richard Eppley), 556
Availability of Plant Nutrients (British Society of Soil Science Discussion on) 159
Avena Electrical Determination of Transport of 3-Indole Acetic Acid in (I A Newman), 1728
Averbach, B L , and others Atomic Mechanisms of Fracture (Tensile Fracture of Mild Steels), 325
Avian Brood Parasitism Prolactin in the Cowbird's Pituitary in relation to (Prof E O Hohn), 2030
Aviation, Ministry of Grant of £1,395 to the University of Oxford, for research on the mechanism of operation of the cryotron, 1535
  Promotion of Dr C H Johnson to chief scientific officer and appointment as director of the Explosives Research and Development Establishment, Waltham Abbey, 1448, 1775
  Promotion of W H Hill to deputy chief scientific officer and appointment as deputy director of Air Armament Research, 1448 , 1775
  Promotion of S A Hunwicks to deputy chief scientific officer and appointment as director of Atomic Weapons (Development), 1775
  Promotion of A N Christmas to deputy chief scientific officer and appointment as director of Guided Weapons (Technique), 1775
Avoidance Response , Effect of a Signal Contingent upon an (Prof J D Keehn and Sanniyah Nakkash), 566
Awards for Study in Statistics (University of Chicago), 772
Axelrad, Dr A A , and others Chromosome Complement of Spontaneous Leukaemia in *AKR* Mice, 998
Axelrod, D I Origin and Dispersal of Flowering Plants (Modern Distribution Patterns), 1200
Axelrod, Dr Julius, and Tomchik, Dr Robert Activation and Inhibition of Adrenaline Metabolism, 2027
Axes to Atoms From, *review* by Dr A R Hall, 921
Axford, W A (compiled by) Handicapped Children in Britain—their Problems and Education (Library Association), 1777
Axiomatic Set Theory (Prof Paul Bernays), *review* by Dr L S Goddard, 1178
Axoplasm (Nerve) Action of Ribonuclease on, as Demonstrated by Silver Staining (R K Winkelmann and Robert W Schmit), 553
Aylward, Dr Francis, and Nichols, B W Sterol Glycosides in Oilseed Phospholipids, 1319
Ayres, P J Biosynthesis and Secretion of Adrenocortical Steroids (Relation of Steroid Secretion to the Histological Zones of the Adrenal Cortex), 416
8-Azaguanine Inhibition of Haemoglobin Synthesis in De-embryonated Chick Blastoderm (B R A O'Brien), 376
Azaroff, Prof Leonid V , and Buerger, Prof Martin J The Powder Method in X-Ray Crystallography, review by Prof H Lipson, 1599
Azide Interference by, with Diazotization Procedures used in Biological Assay Systems (J R Villanueva), 549
  Measurement of Inhibition by, in Biochemical Assay Systems involving Nitrite Estimation by Diazotization (Dr E J Hewitt and D. G Hallas), 1485
Azotobacter vinelandii Fractionation of the System bringing about Oxidative Phosphorylation in (H G Hovenkamp), 471
  A Function for the Extracellular Polysaccharide of (Dr Michael H Proctor), 1934
  A Non-Gummy Chromogenic Strain of (J A Bush and Prof P W Wilson), 381
Azuma, Prof Ryotaro Work in connexion with the 1964 Olympia Games, B A 14
Azuma, R E Appointed a lecturer in experimental and theoretical physics at the University of Glasgow, 1915

BAAR, S Hydrolysis of Heated' Haemoglobin, 986

Billings, Dr A R Appointed professor of electrical engineering in the University of Western Australia, 93, work of, 93
Binaghi, R, and others Promoting Effect of Urea on the *in vitro* Passive Sensitization of Isolated Plain Muscles with Precipitating Antibody, 1805
Binary Alloys Constitution of (Dr Max Hansen) second edition, prepared with the co-operation of Dr Kurt Anderko, *review* by Dr F C Thompson, 1765
Binary Gas Mixtures Sensitivity of Catharometers in Gas Chromatography and the Thermal Conductivity of (A B Littlewood), 1631
Binary Solid Solutions (Dilute), of Bismuth in Tellurium and Tellurium in Bismuth Some Semiconductive Properties of (Dr Tomasz R Piwkowski), 355
Binary Systems Estimation of the Interchange Energy for, from Mutual Solubility Data (Kiyoharu Ishida), 814
Bindal V N (Parthasarathy, S, and) Ultrasonic Absorption in Acetic Acid at 450 kc /s by the Calorimetric Method, 631
Binding with both D-Amino Acid Oxidase Apo-Protein and Benzoate Change of Absorption Spectrum of Flavin Adenine Dinucleotide by its (Dr Kunio Yagi, Takayuki Ozawa and Minoru Harada), 1938
Binding of Haem to Protein in Haemoglobin and Myoglobin (Dr J E Falk, Dr J N Phillips and Dr D D Perrin), 1651, (Dr J E O'Hagan), 1652
Binding of the Sulphydryl Group in D-Amino-Acid Oxidase Apo-Protein with Flavin Adenine Dinucleotide (Dr Kunio Yagi and Takayuki Ozawa), 1227
Bingold, A C, and France, W G Biomechanics (Film on Late Results of Four Massive Internal Prosthesis), 513
Binns, Dr W O Conservation in the Scottish Highlands, 1529
Biochemical Assay Systems involving Nitrite Estimation by Diazotization Measurement of Inhibition by Azide in (Dr E J Hewitt and D G Hallas), 1485
Biochemical Components (Parental), in a *Baptisia* Hybrid Population Applications of Paper Chromatography to Systematics—Recombination of (Dr R E Alston and Dr B L Turner), 285
Biochemical Engineering—Unit Processes in Fermentation (edited by Dr R Steel), *review* by Dr N Blakebrough, 1598
Biochemical Journal Resignation of Dr A G Ogston from the chairmanship of the Editorial Board, 508
  Appointment of Dr W V Thorpe as chairman of the Editorial Board, 508
Biochemical Mechanism of Lesion Formation in Virus-infected Plant Tissues (Dr F Solymosy, Dr G L Farkas and Dr Z Kiraly), 706
Biochemical Method Clinical (Dr A L Tarnoky), *review* by Dr D S H W Nicol, 576
Biochemical Research in India—Golden Jubilee Symposium (Prof P S Sarma), 1367
Biochemical Society Symposium on the Biosynthesis and Secretion of Adrenocortical Steroids, 415
  Symposium on Steric Aspects of the Chemistry and Biochemistry of Natural Products, 947
  Appointment of Dr P N Campbell as secretary to the Committee, 1192
  Appointment of Dr W J Whelan as meetings secretary, 1192
Biochemist's Guide to the Nervous System, *review* by Dr G B Ansell, 1261
Biochemistry at Birmingham, 679
Biochemistry and the Central Nervous System (Prof Henry McIlwain), second edition, *review* by Dr G B Ansell, 1261
Biochemistry of Micro-organisms Biology and (Indian Institute of Science Symposium on), 1367
Biochemistry of Natural Products Steric Aspects of the Chemistry and (Biochemical Society Symposium on), 947
Biochemistry, International Union of (organized by the Science Council of Japan under the auspices of the) Proceedings of the International Symposium on Enzyme Chemistry (Tokyo and Kyoto, 1957), *review* by Dr J B Chappell, 388
Biochemists (Clinical), Association of Election of Officers, 857
Biogenesis (Protein) Specificity in (Centre Interuniversitaire de Recherches enzymologiques Colloquium on), 1198
Biogeochemical Enrichment of Fission Products (Prof Pontus Ljunggren), 912
Biological Action of Deoxyribonuclease I on the Growth of *Euglena gracilis* (Dr Rudolf K Zahn), 1324
Biological Action of Potassium-40 in Naturally Occurring Potash Salts (Prof E Welte and Kl Mechsner), 1958
Biological Ashes (Marine) Some Activation Analyses of Six Trace Elements in (R Fukai and Prof W W Meinke), 815
Biological Assay Systems Interference by Azide with Diazotization Procedures used in (J R Villanueva), 549
Biological Association, Freshwater Twenty-seventh Annual Report (1958-59), 1845
Biological Characteristics (Chromatographic and), of Fish and Frog Neurohypophysial Extracts (Active Principles of the Neurohypophysis of Cold-blooded Vertebrates), (B T Pickering and Prof H Heller), 1463
Biological Clock in *Neurospora* (Growth Patterns in *Neurospora*) (C S Pittendrigh, Dr V G Bruce, N S Rosenweig and M L Rubin), 169
Biological Effects Incorporation of 5-Bromouracil into Transforming Principle of *Bacillus subtilis*, and its (Dr Erela Ephrati-Elizur and Prof Stephen Zamenhof), 472
Biological Effects of Low Doses of Ionizing Radiations (Unesco, the International Atomic Energy Agency and the Comitato Nazionale per le Ricerche Nucleari Symposium on), 1111
Biological Fibres (X-Ray Analysis Group of the Institute of Physics Conference on), B A 25
Biological Half-Life of Radioiron in Man (R Oliver and Dr L G Lajtha), 1882
Biological Laboratory Data (Dr L J Hale), *review* by Prof R C McLean 577
Biological Material Spectroscopic Identification of Alpha-Emitting Nuclides in (Prof W V Mayneord and C R Hill) 667
Biological Media Ionized Calcium in (Prof J Ettori and Sybil N Scoggan), 1315
Biological Origin and Configuration of 10-Hydroxy-Δ^2-decenoic Acid (Dr S A Barker, Dr A B Foster D C Lamb and Dr L M Jackman), 634
Biological Problems arising from the Control of Pests and Diseases (Institute of Biology Symposium on), 1100
Biological Properties of Coal and Coal Extracts (Dr A A Mills), 1885
Biological Properties of Phenols of Plant Origin, *review* by Dr F A Robinson, 486
Biological Research Electronic Apparatus for (P E K Donaldson), *review* by W J Perkins, B A 4
  Future Marine, *review* by Dr J A Allen, 215

Biological Sciences (edited by J G Bugher, J Coursaget and J F Loutit), Vol 2, *review* by Prof G Pontecorvo, 1902
Biological Systems Energy Transfer with special reference to (Faraday Society Discussion on), 688
  Flow Properties of Blood and other (British Society of Rheology and the Colloid and Biophysics sub-Committee of the Faraday Society Discussion on), 322, 1539
Biological (Non-Medical) Problems of Nuclear Physics, Development Commission on (Agricultural Research Council, the Medical Research Council and the) Appointment of Sir James Denby Roberts as chairman of the Joint Committee of the, 237
Biological and Chemical Warfare Pugwash International Conference of Scientists—Statement on, 1018
Biological and Medical Physics Advances in, Vol 6 (edited by Cornelius A Tobias and John H Lawrence), *review* by Dr N M Blackett, 1766
Biological and Physical Properties Turnip Yellow Mosaic Virus Nucleoprotein Particles with differing (R E F Matthews), 530
Biologically Active Fractions of Deoxyribonucleic Acid Immunization with, and Subsequent Specific Infection of Mice (Dr M Kohoutova), 1965
Biologie des Grands Mammiferes Ecologie et (Primates, Carnivores, Ongulés), (Jacques Verschuren), (Exploration du Parc National de la Garamba, Mission H de Saeger, Fasc 9), 155
Biology Comparative Studies of Ultra-structure in (Dr J Lowy), 1445
  Developmental, *review* by Dr D R Newth, 839
  Electronics in, *review* by W J Perkins, B A 4
Biology Developmental, No 1, 236
Biology Institute of Symposium on Biological Problems arising from the Control of Pests and Diseases, 1100
Biology, Institute of (Scottish Branch) Symposium on Conservation in the Scottish Highlands, 1529
Biology The Wistar Institute of Anatomy and, Philadelphia (Dr R E Billingham and Dr H Koprowski), B A 6
Biology of *Amoeba* (Monica Taylor), 1371
Biology (Developmental) Conference Series, 1956—Cytodifferentiation (edited by Dorothea Rudnick), Environmental Influences on Prenatal Development (edited by Beatrice Mintz), Regeneration in Vertebrates (edited by Charles S Thornton), Embryonic Nutrition (edited by Dorothea Rudnick), Immunology and Development (edited by M V Edds, Jr), Dynamics of Proliferating Tissues (edited by Dorothy Price), Wound Healing and Tissue Repair (edited by W Bradford Patterson), (United States National Academy of Sciences—National Research Council), *review* by Dr D R Newth, 839
Biology (Marine) Perspectives in—a Symposium held at Scripps Institution of Oceanography, 1956 (edited by A A Buzzati-Traverso), *review* by Dr J A Allen, 215
Biology and Biochemistry of Micro-organisms (Indian Institute of Science Symposium on), 1367
Biology and Physics (British Society for the Philosophy of Science Symposium on), 1193
Biology (Medical), and Etruscan Origins Ciba Foundation Symposium on (edited by G E W Wolstenholme and Cecilia M O'Connor), *review* by Madelaine Smith, 1348
Biomechanics (Institution of Mechanical Engineers Symposium on), 512
Biometrical Genetics Application of, to Behaviour in Rats (Dr P L Broadhurst), 1517
Biondi, M A Ionization Phenomena in Gases (Technique for the Measurement of Attachment Coefficients for very Low-energy (nearly Thermal) Electrons in Oxygen and Nitrogen), 1354
Bionomics of the Brush-tailed Opossum *Trichosurus vulpecula* in New Zealand (R I Kean), 1388
Biophysical Chemistry Progress in Biophysics and (edited by Prof J A V Butler and Prof B Katz), Vol 9, *review* by P A Merton, 1092
Biophysics and Biophysical Chemistry Progress in (edited by Prof J A V Butler and Prof B Katz), Vol 9, *review* by P A Merton, 1092
Biosynthesis Tropolone—the Enzymatic Decarboxylation of Stipitatonic and Puberulonic Acids (Prof Ronald Bentley and Clara P Thiessen), 552
Biosynthesis of some Amino-Acids from Sucrose by Germinating Uredospores of Wheat Stem Rust, Race 15B (B Kasting, A J McGinnis and W C Broadfoot), 1943
Biosynthesis of Carotenes in Carrot Extracts (Dr V V Modi and D K Patwa), 983
Biosynthesis of Chondroitin Sulphates (J B Adams), 274
Biosynthesis of Corynomycolic Acid from Two Molecules of Palmitic Acid (Dr Mireille Gastambide-Odier and Prof E Lederer), 1563
Biosynthesis and Secretion of Adrenocortical Steroids (Biochemical Society Symposium on), 415
Biosynthesis (Ascorbic Acid) Stimulatory Effect of Foreign Compounds on, and on Drug-Metabolizing Enzymes (Dr A H Conney and Dr J J Burns), 363
Biosynthesis (Haem and Porphyrin) Effect of Oxygen Tension on (J E Falk, R J Porra and Ann Brown, and F Moss and Helen E Larminie), 1217
Biosynthesis (Protein), and Oxidative Phosphorylation in Isolated Rat Liver Mitochondria (P J Reis, J L Coote and T S Work), 165
Biosynthesis (Ribonucleic Acid) Kinetics of Virus Protein and (Replication of Tobacco Mosaic Virus), (Prof Barry Commoner, Dr James A Lippincott and Dr Janey Symington), 1992
Birch, Prof A J The Terpenes, *review*, 302
  The Chemistry of Natural Products, *review*, 754
Birch Seedlings Early Induction of Flowering in (Dr K A Longman and Prof P F Wareing), 2037
Bird, Dr G W G Anti-A Haemagglutinins from a Non-Leguminous Plant, *Hyptis suaveolens* Poit, 109
Bird (Equatorial), *Quelea quelea* Effect of Photoperiod on the Gonadal Cycle in an (Dr Albert Wolfson and David P Winchester), 1658
Bird (Xerophilous Equatorial), *Quelea quelea* Duration of the Regeneration Period of the Internal Reproductive Rhythm in a (H J de S Disney, B Lofts and Dr A J Marshall), 1659
Bird Paintings (Some Eighteenth Century), in the Library of Sir Joseph Banks (1743-1820), (Averil Lysaght), 941
Birds The (Oskar and Katharina Heinroth), English edition prepared by Michael Cullen, *review*, 1439
  Radar Echoing Area Polar Diagrams of (J Edwards and E W Houghton), 1059
  Resident British (Educational Productions, Ltd, Filmstrip CX 6208), 1777
Birds of the Palearctic Fauna—Order Passeriformes (Dr Charles Vaurie), *review* by Sir Landsborough Thomson, 666
Birds of Prey, *review* by Sir Landsborough Thomson, 1435
Birds of Sydney (County of Cumberland), New South Wales (K A Hindwood and A R McGill), *review* by Dr A J Marshall, 841
Birds (Captive Marine), possessing a Functional Lateral Nasal Gland (Salt Gland), (Prof Larry Z McFarland), 2030
Birds (Gallinaceous) Immunological Distances among some (Danilo Mainardi), 913
Birefringence of Montmorillonite Complexes (R Greene-Kelly), 181
Birkbeck College, London Title of reader in zoology in the University of London conferred on T E Hughes, 322
Birkett, L, and Wood, R J Shell and Siphon Regeneration in *Mactra stultorum* Linne (Lamellibranchiata), 1075

Block (An Exteroceptive), to Pregnancy in the Mouse (Hilda M Bruce), 105
Blocking Action (Neuromuscular), of some Antibiotics (G Bezzi and G L Gessa), 905
Blocking Agent (Copper-Catalyst) Inhibition of Rous I Sarcoma Metastases by a (Dr B M Jones), 1963
Blocking Agents (Neuromuscular) Effect of some, on Mitochondrial Enzyme Systems (Dr J H Koch and Dr C H Gallagher), 1039
Blocking Drugs (Ganglion) Action of, on Choline Acetylase (Dr J E Gardiner), B A 71
Blom, L , and Caris, J Quantitative Paper Chromatography based on the Sub-Micro Titration of Derivatives containing Nitro Groups, 1313
Blood Hormone Effects on Early Distribution and Disappearance from the, of Promethium-147 in Rats (Dr Bergene Kawin), 1816
  Post-Exposure Analysis of Organic Compounds in the by a Rapid Infra-red Technique (Dr R D Stewart, D S Erley, T R Torkelson and C L Hake), 192
Blood treated with Dextran Release of Histamine from Rat Mast Cells by (Dr G T Archer), 1151
Blood through Narrow Tubes The Flow of (Prof M Reiner and Dr G W Scott Blair) 354
Blood of Parr and Smolt Stages of the Atlantic Salmon Sodium Regulation in the (Prof H J Koch, J C Evans and E Bergstrom) 283
Blood (Adult Chicken) Cytological Identification of Proliferating Donor Cells in Chick Embryos injected with (P M Biggs and L N Payne), 1594
Blood (Discarded Blood Bank), as a Source of Protein for Cultivation of HeLa Cells (Billy R Blakey and Prof George E Gifford), 1158
Blood (Duck) incubated *in vitro* Pathway of Carbon-^{14} Incorporation from $NaH^{14}CO_3$ to Haem in (A Breccia, A L Fantola E Lazzarini and A Giustina), 1879
Blood (Injected Mouse) Abrogation by, of Protective Effect of Foreign Bone Marrow in Lethally X-Irradiated Mice (L J Cole and R M Garver), 1815
Blood and other Biological Systems Flow Properties of (British Society of Rheology and the Colloid and Biophysics sub-Committee of the Faraday Society Discussion on), 322
Blood, Cerebrospinal Fluid and Urine α-Ketoglutaric Acid and Pyruvic Acid in (Dr E Zelnicek), 727
Blood Acetylcholinesterase in *Phalaris* Staggers (Dr D J Walker), 1411
Blood Anticoagulant (Bridge) Neutralization of (Dr F Nour-Eldin), 1419
Blood Bank Blood (Discarded), as a Source of Protein for Cultivation of HeLa Cells (Billy R Blakey and Prof George E Gifford), 1158
Blood Cell (Red) Receptors Influence of Streptomycin Solutions on the Interaction between the Agglutinating Sera and the Corresponding (Dr M Kout and Dr Z Kubickova), 639
Blood Cells of *Drosophila melanogaster* *In vitro* Cultivation of, in a Synthetic Medium (Dr Masakatsu Horikawa and Dr Yukiaki Kuroda), 2017
Blood Cells (Circulating) Synthesis of Haem by (Peggy Clark and Dr R J Walsh), 1730
Blood Cells (Red) Coating of, with Antigenic Substances (Dr K Deutsch), 278
Blood Cells (White), of Rats (*WR* Strain) A Sex Difference in (Dr Hans Meier), 1082
Blood Coagulating System and the Physiological Anticoagulating System Interrelations between the (Prof P A Kudrjashov), 454
Blood Constituents A Low Concentration of certain observed in Offspring of Alloxan-Diabetic Rabbits (Dr Otakar Sirek and Dr Anna Sirek) 456
Blood Corpuscles (Red) Effect of Polyphloretin Phosphate on the Suspension Stability of (Dr Bengt Fries), 62
Blood Cortisol in the Sheep—Normal Concentration and Changes in Ketosis of Pregnancy (H R Lindner), 1645
Blood Donors (406 French) Frequencies of the Haptoglobin Groups in (Dr J Moullec and Dr J M Fine), 196
Blood Elements (Injured Cellular) in Extracorporeal Circuits Release of Adenosine Triphosphate and Serotonin from (Dr H S S Sarajas, Dr R Kristoffersson and Dr M H Frick), 1127
Blood-feeding Habits of Adult Noctuidae (Lepidoptera) in Cambodia (W Buttiker), 1167
Blood Flow (Renal) Mechanism of Autoregulation of (Dr Allen M Scher), 1322
Blood Group Antigen Js^a(New) among South American Indians Frequency of the (Dr Miguel Layrisse and Dr Zulay de Layrisse), 640
Blood Group Antigen Sw_a A 'New Human (T E Cleghorn), 1324
Blood Group Methods and Techniques, *review* by Dr R A Zeitlin, 130
Blood Grouping Practical (Dr F Stratton and Dr P H Renton), *review* by Dr R A Zeitlin, 130
Blood Grouping of the Remains of Swedenborg (Madeleine Smith), 867
Blood Groups (Abo), and Fertility in a Normal American Population An Association between (Dr T Edward Reed and Dr J H Ahronheim), 611
Blood Keto-Acids in Kwashiorkor (Prof J C Edozien), 1150
Blood Sampling Effect of Dietary Fat and Extent of, on the Level of Plasma Cholesterol in the Rat (I Coleman and J M R Beveridge), 1039
Blood Serum Determination of Magnesium in, by Atomic Absorption Spectroscopy (Dr J B Willis), 186
Blood Sugar and Liver Glycogen Level of Normal and Adrenalectomized Mice Effect of Diet on the (B P Block and Dr G S Cox), 721
Blood Supply (Tumour) A Rapid Method for studying, using Systemic Dyes (Dr R J Goldacre and Dr B Sylvén), 63
Blood Velocity Patterns Intravascular and Intracardiac, recorded by means of *NTC* Resistors (Dr W G Zijlstra, J R Brunsting and L B v d Slikke), 991
Blood Vessels (Small), in Human Multiform Glioblastoma Electron Microscopical Structure of the Wall of (Dr S H M Nystrom), 65
Bloodworth, G G Appointed lecturer in elctronics at the University of Southampton, 1915
Bloor, J E , and Gartside S Effect of Hybridization Changes on the Bond Energies of Carbon–Carbon Single Bonds, 1313
Blue Material (Rice's) Some Experiments on (J W Clarke and G McTurk), 2014
Blue Tick Pyrethrum Resistance conferred by Resistance to DDT in the (G B Whitehead), 378
Blue Tick, *Boophilus decoloratus* Contents of Cystine-Cysteine, Glutathione and Total Free Sulphydryl in Arsenic-resistant and Sensitive Strains of the (Dr J S Harington), 1739
Blum, William P , and others Isomers of Vitamin A in Fish Liver Oils, 1377
Blumberg, Dr B S , and Gartler Dr S M High Prevalence of High-Level β-Aminoisobutyric Acid Excretors in Micronesians, 1990
Blundell, Dr D J Appointed lecturer in geology at the University of Birmingham, 1026, 1362
Blundell, Dr D J , and Stephenson, P J Palaeomagnetism of some Dolerite Intrusions from the Theron Mountains and Whichaway Nunataks, Antarctica, 1860

British Antarctic Party, 1985
British Association for the Advancement of Science Presidential Address, The Proper Study of Mankind is Man (Sir James Gray), B A 35
  Summaries of Addresses of Presidents of Sections, B A 41
  Presidential Address to Section A (Mathematics and Physics), The Visualization of Magnetic Processes (Prof L F Bates), B A 41
  Presidential Address to Section B (Chemistry), Medical Aspects of Complex Carbohydrates (Prof M Stacey), B A 42
  Presidential Address to Section C (Geology), Recent Developments and Trends in Palaeontology (Prof O M B Bulman), B A 42
  Presidential Address to Section D (Zoology), Man and the World's Fauna (Dr L Harrison Matthews), B A 43
  Presidential Address to Section E (Geography), Trends in Urban Expansion (Prof K C Edwards), B A 43
  Presidential Address to Section F (Economics), How Much Science ? (Prof J Jewkes), B A 44
  Presidential Address to Section G (Engineering), The Critical Importance of Transport and Communications (Sir Ewart Smith), B A 44
  Presidential Address to Section I (Physiology and Biochemistry), Artificial Organs—Biological Applications (Prof A Hemingway), B A 45
  Presidential Address to Section J (Psychology), Perception, Attention and Consciousness (Prof Magdalen D Vernon), B A 45
  Presidential Address to Section K (Botany), Plants on Land and in the Oceans (Dr W R G Atkins), B A 46
  Presidential Address to Section K*(Forestry), Pathogenic Factors in the Rooting Space and the Development of Even-Aged Plantations (W R Day), B A 46
  Presidential Address to Section L (Education), What are our Schools For ? (Sir James J Robertson), B A 47
  Presidential Address to Section M (Agriculture), Balance in British Farming (Dr H G Sanders), B A 48
  Election of Sir George Thomson as president for 1960, 151
  Section A (Mathematics and Physics) Discussion on Crystal Physics, 596
  Sections A (Mathematics and Physics) and H (Anthropology) Discussion on Radio-carbon Dating, 672
  Section B (Chemistry) Symposium on the Chemistry of Clothing, 849
  Section B (Chemistry) Discussion on Rocket Propulsion, 1264
  Sections B (Chemistry) and H (Anthropology) Discussion on Chemistry in the Preservation of Antiquities, 585
  Section D (Zoology) Symposium on the Evolution of Host-Parasite Relationships, 760
  Section D (Zoology) Symposium on Animal Clocks, 763
  Sections D (Zoology) and K (Botany) Symposium on Genetics and the Origin of Species, 587
  Sections E (Geography) and K (Botany) Discussion on Coast Erosion and Accretion, 499
  Section I (Physiology and Biochemistry) Discussion on Cell and Organ Culture, 935
  Section J (Psychology) Discussion on Chance and Probability, 497
  Section X (Assembly of Corresponding Societies) Meeting on Science by the Upper Form, 596
  To send two representatives (Dr W E Swinton and Sir George Allen) to the U S S R , 1271
British Association of British Rubber Manufacturers Publication of a translation of the Soviet journal *Kauchuk i Rezina* under the title *Soviet Rubber Technology*, 505
British Birds Resident (Educational Productions, Ltd , Filmstrip CX 6208), 1777
British Books and Films Overseas Distribution of, 1448
British Books and Foreign Markets, 605
British Books and Periodicals Exhibition in Moscow of (British Council and the Soviet Ministry of Culture), 1361
British Broadcasting Corporation Establishment of a Science Unit, 1361
British Caribbean, Regional Research Centre of the Soil and Land-Use Surveys, No 1, Parish of St Catherine, Jamaica (K C Vernon) , No 2, The Rupununi Savannas of British Guiana (R F Loxton, G K Rutherford and J Spector) , No 3, St Vincent (J P Watson, J Spector and T A Jones), 27
British Carnivores (R F S Creed), 1535
British Cast Iron Research Association Open Days (H Morrogh), 323
British Ceramic Research Association New Mellor Library opened by Frank West, 153
  Symposium on Special Ceramics, 1115
  Retirement of Dr A T Green from the directorship, 1843
  Appointment of Dr N F Astbury as director, 1843
British Coal Utilization Research Association (Staff of the) Studies of Coal —Carbonization of Coals in the Presence of Activated Charcoal (R L Bond, A M Godridge, A R Murnaghan, D H Napier and D J Williams), 425 , Smoke Emission from Coal and Low-Temperature Chars (D Finch), 426
British Coke Research Association (Coke Oven Managers' Association, the Institution of Gas Engineers and the) Joint Meeting, 1778
British Colonial Territories, 1541
British Committee (Joint), for Vacuum Science and Technology Formation of a, 1191
British Commonwealth, Association of Universities of the Commonwealth Universities Yearbook, 1959, *review*, 577
British Commonwealth Education Liaison Committee Establishment of a, 1361
British Computer Society First Conference (Dr A S Douglas), 945
British Contribution to High-Altitude Research, 1776
British Cotton Industry Research Association Fortieth Annual General Meeting, 1846
  Open Days at the Shirley Institute, 1846
British Council Scientific Research in British Universities (1958-59), 854
  Course on Digital Computers, 1450
British Council (Science Department) Third list of Nuclear Studies, 235
British Council and the Soviet Ministry of Culture Exhibition in Moscow of British Books and Periodicals, 1361
British East African Waters Black Marlin in (F Williams), B A 78
British Ecological Society Symposium on the Exploitation of Natural Animal Populations, 1451
British Electrical and Allied Industries Research Association (Prof J Greig), 1538
British Electronic Achievements, 943
British Embassy, Washington Appointment of Henry Edmunds as assistant agricultural and food attaché, B A 16
British Farming Balance in (Dr H G Sanders), B A 48
British Food Manufacturing Industries Research Association Open Days (Prof B R Knapp), 1275
British Forestry Commission Thirty-ninth Annual Report, 1457
British Gelatine and Glue Research Association Appointment of Dr D A Sutton as director of research, 318
  Seventeenth Meeting of the Research Panel (Alan G Ward), 862
  Discussion on Gelation, 863
British Glass Industry Research Association New Laboratories of the, 775
British Hat and Allied Feltmakers Research Association Annual Report (1957-58), 320
British Industries, Federation of Forty-second Annual Report (1958), 94
British Industries, Federation of (Liverpool District) Conference on the Relationship between Industry and Technical Colleges, 1690
British Industry, *review* by Prof A J Brown, 1089
British Industry The Structure of, a Symposium (edited by Duncan Burn), *review* by Prof A J Brown, 1089
British Institute of Management Cost of Labour Turnover, 1110
British Institute of Management and the Ministry of Labour Conference on Relationships in Industry—some Changing Concepts of Management, 156
British Institution of Radio Engineers Clerk Maxwell Premium awarded to C Powell and D A Hendley, 857
  Heinrich Hertz Premium awarded to K Foster, 857
  Sir Louis Sterling Premium awarded to Dr A van Weel, 857
  Sir J C Bose Premium awarded to Dr B Ramachandra Rao, Dr M Srirama Rao and C Abhirama Reddy, 857
  Brabazon Premium awarded to Prof D G Tucker, Dr V G Welsby, R Kendall and D E N Davies, 957
  Marconi Premium awarded to Dr Morton B Prince and M Wolf, 857
British Iron and Steel Research Association—London Group Laboratories Open Days (D U Hunt), 1536
British Isles Excursion Flora of the (Prof A R Clapham, Prof T G Tutin and Dr E F Warburg), *review* by P Falk, 1093
  Land and Water Bugs of the (Dr T R E Southwood and Dennis Leston), *review* by W J Le Quesne, 1977
British Mammals and some Others (Dr J F D Frazer), 29
British Medical Association The Life and Times of Sir Charles Hastings, Founder of the (Dr William H McMenemey), *review* by Dr W R Bett, 923
British Museum (Natural History) Accommodation given to the International Commission on Zoological Nomenclature, 156
  Bulletin, Geology, Vol 4, No 1, A Contribution to the Odontology of *Oreopithecus* (P M Butler and J R E Mills), 682
  Bulletin, Historical Series, Vol 1, No 6, Some Eighteenth Century Bird Paintings in the Library of Sir Joseph Banks (1743-1820), (Averil Lysaght), 941
  Some Additions to the (Sir Gavin de Beer), 1682
  Return of Dr G H Francis and Dr A J Charig from their Expedition to South Peru, 1687
British Neutron Source Thermal Reactor, 1533
British Non-Ferrous Metals Research Association New Research Laboratories, 234, 242
  Election of F C Braby as chairman of the Council, 1273
British Nuclear Energy Conference (Institution of Electrical Engineers and the) Convention on Thermonuclear Processes, 240
British Occupational Hygiene Society Eleventh Conference (Heating and Ventilation), 1987
British Overseas Information Services, 1692
British Paint, Colour and Varnish Manufacturers, Research Association of Retirement of Dr L A Jordan as founder-director, 852
British Parasitic Fungi (W C Moore), *review* by Dr Lilian E Hawker, 1977
British Petroleum Trading, Ltd Grant of £3,000 to the University of Oxford, for the purpose of continuing a research fellowship in geochemistry, 1688, 1986
British Rayon Research Association Open Days (L A Wiseman), 600
British Rubber Manufacturers, Research Association of Publication of a translation of the Soviet journal *Kauchuk i Rezina* under the title *Soviet Rubber Technology*, 505
British Scientific Instrument Research Association Changes in the publications, 320
  To produce an English translation, under the title *Instrument Construction*, of the Russian journal *Priborostroenie*, 592
British Seas *Acanthocottus liljeborgi* (Collett) in (P J Miller), 1162
British Society for Immunology Symposium on Delayed Hypersensitivity, 1029
British Society for the Philosophy of Science Fourth Annual Conference, 1193
  Symposium on Scientific Research and the Philosophy of Science, 1193
  Symposium on Biology and Physics, 1193
  Symposium on Classification, Concept-formation and Language, 1193
  Symposium on Knowing and Being, 1193
British Society of Rheology Election of Officers for 1959-60, 943
  Meeting in Manchester, 1535
British Society of Rheology and the Colloid and Biophysics sub-Committee of the Faraday Society Discussion on Flow Properties of Blood and other Biological Systems, 322, 1539
British Society of Soil Science Discussion on Availability of Plant Nutrients, 159
British Space Research, 24
British Universities Scientific Research in, 1958-59 (British Council), 854
British Universities Film Council Twelfth Annual General Meeting (Dr J Horne), 330
  Discussion on the Visual Illustration of University Lectures, 515
British Welding Research Association and the Engineering Department of the University of Cambridge Symposium on Fatigue of Welded Structures, 1915
Brittain, Dr Robert Rivers and Man, *review* by Dr E H Brown, 1977
Broad, E R Modern Network Theory in Electrical Engineering (Place and Teaching of Electrical Network Theory in Universities and Technical Colleges), 1692

Broad Bean (*Vicia faba* L) Glyceric Acid in (R I Morrison and Dr P C Dekock), 819
Broadbent, Dr D E Ergonomics, its Place in Industry, B A 21
  Recent Studies of Noise Problems (Human Response to Noise—Effects of Noise on Working Efficiency), 414
Broadbent, Prof T A A Differential Equations for Instrumentation Engineers, *review*, 6
  Puzzle-Math, *review*, 217
  Selections from Modern Abstract Algebra *review*, 301
  Numerical Analysis and Partial Differential Equations, *review*, 576
  Introduction to Functional Analysis, *review*, 666
  Fourier Series, *review*, 1176
Broadcasting Two Threats to—Political and Commercial Control (H Carleton Greene), 661
Broadcasting and Television Future of, 1747
Broadening (Collision) of Spectral Lines, 155
Broadfoot, W C, and others Biosynthesis of some Amino-Acids from Sucrose by Germinating Uredospores of Wheat Stem Rust, Race 15B, 1943
Broadhead, C H Personnel Management and Technological Change (Growth, Development and Possible Extension of Personnel Management in British Industry), 1614
Broadhurst, Dr P L Application of Biometrical Genetics to Behaviour in Rats, 1517
Broccoli Floral Abnormalities in (D R Sampson and M MacArthur), 682
Brod, Dr J, and others Haemodynamics in Essential Hypertension, 1643
Broda, Prof E, and others Production of Serum Albumin and of Globulins by Chick Mesenchymal Tissue and by HeLa Tumour Tissue in Culture, 361, *erratum*, 943
Brody, Dr S S Fast Chemical Reactions in Solution (Direct Measurement of Energy Transfer Processes), 1454
Brody, Dr S S (Rabinowitch, Prof B, and) Energy Transfer with special reference to Biological Systems (Energy Migration in Photosynthesis), 689
Broggi, Prof J A Elected to foreign membership of the Geological Society of London, 1360
Bromide Ion A Peripheral Effect of the, on the Contraction of Striated Muscle (Dr D K de Jongh and H A Linnewiel), 1240
5-Bromouracil Incorporation of, into Transforming Principle of *Bacillus subtilis* and its Biological Effects (Dr Erela Ephrati-Elizur and Prof Stephen Zamenhof), 472
Bronchodilator Alkaloid (Vasicicone) from *Adhatoda vasica* Nees (A H Amin and D R Mehta), 1317
Brongersma, Dr L D The Animal World of Netherlands New Guinea, *review* by J E Hill, 1261
Bronk, Dr Detlev W A University of Graduate Studies, 86
  The Structure of Science, B A 6
  Special Medal of the Society for Promoting International Scientific Relationships awarded to, 1685
Brood Parasitism (Avian) Prolactin in the Cowbird's Pituitary in relation to (Prof E O Hohn), 2030
Brooke, Marcus S, and others Inhibition of Urease by Alloxan and Alloxanic Acid, 1936
Brookes, A M P Visual Illustration of University Lectures, 516
Brooklyn Botanic Garden, and others Fourth International Conference on Plant Growth Regulation, 599
Brooks, C E Ergonomics, its Place in Industry, B A 21
Brooks, H (edited by) Advances in Semi-Conductor Science—Proceedings of the Third International Conference on Semi-Conductors, Rochester, 1958, *review* by Dr J R Tillman, 1674
Brooks, Dr John R, and others Maintenance of Parathyroid Tissue Fragments on Agar Substrates, 1734
Brown, Ann, and others Effect of Oxygen Tension on Haem and Porphyrin Biosynthesis, 1217
Brown, Prof A J British Industry, *review*, 1089
  New Ideas for Industry, *review*, 1348
Brown, Dr E H Rivers and Man, *review*, 1977
Brown, F, and Stewart, Doreen L Effect of Proflavine on the Formation of Virus of Foot-and-Mouth Disease and its Infective Ribonucleic Acid in Pig Kidney Tissue Culture Monolayers, B A 74
Brown, Prof F A Animal Clocks, 763
Brown, F B, and others Coal Science (Chemical Reactions of Coal—Phenolic Hydroxyl in Vitrains), 412
Brown, Dr F H, and others Energy Transfer with special reference to Biological Systems (Electronic Energy Transfer in Solution), 689
Brown, G, and Stephen, Dr I Clay Minerals (Studies on Iddingsite), 780
Brown, Dr G E Title of professor of mathematical physics in the University of Birmingham conferred on, 679, work of, 679
Brown, Dr J K Appointed lecturer in chemistry at the University of Birmingham, 1362, 1688
Brown, Dr J K, and others Coal Science (Data obtained on Coal by High-resolution Magnetic Resonance Spectroscopy), 412
Brown, Paul K, and others Photochemical and Stereochemical Properties of Carotenoids at Low Temperatures—*Cis-trans* Isomerism and Steric Hindrance, 617
Brown, Patricia S, and others Isomers of Vitamin A in Fish Liver Oils, 1377

Caswell, G H (Williams, C N , and) An Insect attacking *Striga*, 1668
Cat Induced Tolerance to D-Tubocurarine Chloride in the (Fiona Acheson and Dr R J M Fry), 1409
Cat (Unanaesthetized) Evoked Potentials in Visual Cortex of the (Gabriel Horn and John Blundell), 173
Catala, J , and others Two Cases of Triple Fission of Uranium-235, 1057
Catalases of Acid-fast Bacilli Difference between the (Wieslaw Tysarowski and Stanislaw Kwiek), 1513
Catalysis, *review* by Dr E B Maxted, 750
Catalysis (edited by Prof Paul H Emmett), Vol 5, Hydrogenation, Oxo-Synthesis, Hydrocracking, Hydrodesulphurization, Hydrogen Isotope Exchange and related Catalytic Reactions, *review* by Dr E B Maxted 750 , Vol 6, Alkylation, Isomerization, Polymerization, Cracking and Hydroreforming), *review* by Dr David M Wilson, 1090
Catalysis Contact (Dr R H Griffith and J D F Marsh), *review* by Dr E B Maxted, 1262
  Heterogeneous, *review* by Dr F S Stone, 1974
Catalysis and related Subjects Advances in, Vol 9, (edited by Adalbert Farkas), *review* by Dr E B Maxted, 750 , Vol 10, (edited by D D Eley, W G Frankenburg and V I Komarewsky), *review* by Dr F S Stone, 1974
Catalyst (Copper-) Blocking Agent Inhibition of Rous 1 Sarcoma Metastases by a (Dr B M Jones), 1963
Catalytic Processes and Petroleum, *review* by Dr David M Wilson, 1090
Cataract (Experimental Galactose) Carbohydrate Metabolism in the (Dr Sidney Lerman), 1406
Cataract (Radiation) Possible Mechanism of Cysteine Protection against (A Pirie and L G Lajtha), 1125
Cataract ('Sugar') Formation of Polyols by the Lens of the Rat with (Dr Ruth van Heyningen), 194
Catcheside, Prof D G Cytoplasmic Inheritance 1012
Catchment Areas (Tropical) A Physical Basis for Land Use Policy in (Dr H C Pereira), 1768
Catechol Amines Effects of 1,4-Dihydrazinophthalazine on Organ Content and Adrenal Medullary Secretion of (M Bygdeman and L Stjarne), 1646
Catechol Amines (Adrenal), induced by Reserpine Abolition by Chlorpromazine of the Inhibiting Effect of Iproniazid on the Depletion of (F Camanni, Dr G M Molinatti and M Olivetti), B A 65
Catharometers in Gas Chromatography Sensitivity of, and the Thermal Conductivity of Binary Gas Mixtures (A B Littlewood), 1631
Cathode (Oxide) Current Fluctuations in the (Margaret Chisholm and Dr L Jacob), 1058
Cathode Surfaces Insulating Particles on—their Effect upon Electrical Discharges (L B Griffiths and P C L Pfeil), 1475
Cationic Detergent Interaction between Nucleic Acid and a (Prof Dino Guerritore and Luciano Bellelli), 1638
Cationic Macromolecules Reduction of Toxicity of, by Complexing with Anionic Derivatives of Synthetic Polyglucoses (P T Mora, B G Young and M J Shear), 431

Cations (Exchangeable), in Vermiculite Diffusion of (G F Walker), 1392
Cations (Monovalent), and the Incorporation of Metabolites by Isolated Thymus Nuclei (Dr Theodore R Breitman and Dr George C Webster), 637
Cats (Laboratory) Reduction in the Anoestrus Period of, by Increased Illumination (Dr Patricia P Scott and Marny A Lloyd-Jacob), 2022
Catterall, Dr J A A Handbook of Lattice Spacings and Structures of Metals and Alloys, *review*, 841
Cattle Infection of, with *Cysticercus bovis* by the Injection of Onchospheres (G Froyd and M C Round), 1510
Cattle and Buffaloes of India, 941
Cattle (Beef), (*Bos taurus* and *Bos indicus*) A Possible Explanation for Part of the Difference in Heat Tolerance Exhibited by (H P Ledger), 1405
Cattle (Grazing) A Relationship between Weight of Internal Fat, 'Fill', and the Herbage Intake of (J C Tayler), 2021
Cattle (Zebu) β-Globulin Alleles in some (G C Ashton), 1135
Cauer, Wilhelm Synthesis of Linear Communication Networks, second edition edited by Wilhelm Klein and Franz M Pelz (translated from the German by G E Knausenberger) *review*, 1525
Cause of Reverse Thermo-Remanent Magnetism Exchange Interaction as a (T Nagata and S Uyeda), 890
Cause of Wear in Sheeps' Teeth (Dr G Baker, Dr L H P Jones and I D Wardrop), 1583
Causes de la Répartition des Êtres Vivants (Raymond Furon), *review* by Prof Ronald Good, 390
Cavallini, D, and others Degradation of Thiotaurine by Ionizing Radiations, B A 61
Cave-Browne-Cave, Wing-Comdr T R At the Annual General Meeting and Conference of the Mathematical Association (Mechanics of the Fun Fair), 33
Cawley, Dr C M Appointed chief scientist to the Ministry of Power, 232, work of, 232
Cayless, M A Ionization Phenomena in Gases (The Positive Column of Low-pressure Mercury-rare Gas Discharges), 1355
Cedarholm, J P, and Townes, Prof C H A New Experimental Test of Special Relativity, 1350
Cell and Organ Culture (British Association for the Advancement of Science, Section I (Physiology and Biochemistry), Discussion on), 935
Cell and Tissue Culture (Dr John Paul), *review* by Dr I Leslie, 1009
Cell (Bacterial) Affinity of Lysozyme to Structural Elements of the, as studied with Enzyme Labelled with Radioactive Iodine (Prof C Weibull, B Zacharias and H Beckman), 1744
Cell (Living) Inside the (Dr J A V Butler), *review* by Dr W L Sumner, 134
Cell (Red Blood) Receptors Influence of Streptomycin Solutions on the Interaction between the Agglutinating Sera and the Corresponding (Dr M Kout and Dr Z Kubickova), 639
Cell (Retinula) Response of a Single, to Polarized Light (M Kuwabara and K Naka), 455
Cell (Tumour-) Cultures in Contact with Lysozyme Appearance of Granules in the Cytoplasm of (Dr Carlo Callerio), 202, *erratum*, 508
Cell (Unit), of Mercuripapain Crystals (J Drenth and J N Jansonius), 1718
Cell Culture Growth-Controlling Action of Human Serum in (Dr Kari Penttinen and Dr Erkki Saxen), 1570
Cell Cultures (Monkey Kidney), infected with Poliomyelitis Virus and Incubated at 22°-30°C Appearance of Crystalline Needles in (Dr Esther Tenenbaum), 1657
Cell Fragments Paper Chromatography of (A T Wilson), 2016
Cell Lines (Unsusceptible) Infectivity of Polio Virus Ribonucleic Acid for Embryonated Eggs and (P De Somer, Dr A Prinzie and E Schonne), 652
Cell Membranes in the Anterior Pituitary Gland A Dense Laminar Structure found in Conjunction with (Barbara G Barnes), 651
Cell Membranes (Plant) Maintenance of Semipermeability of, in the Absence of Metabolic Energy Supply (Dr B Ginzburg), 1073
Cell Physiology of Neoplasia (University of Texas Anderson Hospital and Tumour Institute fourteenth Annual Symposium on Fundamental Cancer Research), 1451
Cell Population (Mast), of Lung of the Guinea Pig and other Tissues (Dr W G Smith), 1154
Cell Types (New), in the Salivary Glands of the Brown Ear Tick, *Rhipicephalus appendiculatus* Neumann (Dr W M Till), 1078
Cell–Virus Relationships (Different) Formation of, in Tumour Cells induced by Polyoma (Dr Leo Sachs and Ernest Winocour), 1702
Cell-Wall Formation in Root Hairs (A B Wardrop), 996
Cell-Wall Mucopeptides of *Staphylococcus aureus* and *Micrococcus lysodeikticus* (H J Rogers and H R Perkins), 520
Cell Walls (Maize Coleoptile) A Partial Chemical Characterization of, prepared with the Aid of a Continually Renewable Filter (Prof Aleksander Kivilaan, Teofila C Beaman and Robert S Bandurski), B A 81
Cell-free Enzymes Combined Use of Polymyxin and Acetone to obtain (J R Villanueva), 1565
Cell-free Extracts Effect of, from *Mycobacterium tuberculosis* $H_{37}Rv$ on Lung Succinooxidase (Dr A Bekierkunst and M Artman), 458
Cellobiose Structure of (Robert A Jacobson, Jeffrey A Wunderlich and Prof William N Lipscomb), 1719
Cells The Culture of, *review* by Dr I Leslie, 1009
Cells of Higher Plants A New Technique for Isolating and Cloning (Ludwig Bergmann), 648
Cells with Modified Deoxyribonucleic Acid Unimpaired Mitosis in (Rolla B Hill, jun, Klaus G Bensch and Donald W King), 1429
Cells of Pea and Wheat Embryos Fine Structure in (G Setterfield, H Stern and F B Johnston), 505
Cells which Synthesize Deoxyribonucleic Acid in Guinea Pig Bone Marrow during Recovery from Whole-Body γ-Irradiation (P F Harris and J H Kugler), 1883
Cells (Algal) Value of a Simple Observational Technique for Determining the Fat Content of (Dr J H Evans), 1737
Cells (Bacterial), utilizing Hydrocarbons for Growth Incorporation of Molecular Oxygen in (E R Leadbetter and J W Foster), 1428
Cells (Blood), of *Drosophila melanogaster* *In vitro* Cultivation of, in a Synthetic Medium (Dr Masakatsu Horikawa and Dr Yukiaki Kuroda), 2017
Cells (Calf Kidney) Interferon produced by Cultures of (Dr D A J Tyrrell), 452
Cells (Circulating Blood) Synthesis of Haem by (Peggy Clark and Dr R J Walsh), 1730
Cells (Damaged Endothelial) Some Properties of (Dr J R O'Brien), 1580
Cells (Duck Red), *in vitro* Rôle of Stroma in Haemoglobin Synthesis—Experiments on (A Breccia A L Fantola, E Lazzarini and A Giustina), 1878
Cells (Frog Nerve) Resting and Action Potentials of Reversed Polarity in (Dr I Tasaki), 1574
Cells (Frozen Fat Body), in an Insect Survival of (R W Salt), 1426
Cells (Glial), (Isolated, Fresh Nerve Cells and) from Control and Stimulated Animals Quantitative Assay of Compounds in (Prof Holger Hyden), 433
Cells (HeLa) Discarded Blood Bank Blood as a Source of Protein for Cultivation of (Billy R Blakey and Prof George E Gifford), 1158
Cells (Human Erythroid), *in vitro* Lack of Direct Effect of Erythropoietin on (Edward L Alpen, L G Lajtha and Donald C Van Dyke), 1228
Cells (Human Red) Accumulation of Dextran in, after Haemolysis (N V B Marsden and S G Östling), 723
  Calcium Ions and the Permeability of (Prof M Maizels), 366
Cells (Human Tissue Culture) Cellular Uptake of Deoxyribonucleic Acid by (Dr Stanley M Gartler), 1505
Cells (Intact Ascites Tumour) Efficiency of the Mitochondrial Oxidative Phosphorylations in (Dr P Emmelot and C J Bos), 2024
Cells (Isolated, Fresh Nerve) and Glial Cells from Control and Stimulated Animals Quantitative Assay of Compounds in (Prof Holger Hyden), 433
Cells (Liver and Kidney) Absorbancy Measurements on (Localization and Assay of Respiratory Enzymes in Single Living Cells), (Dr Bo Thorell and Prof Britton Chance), 934
Cells (Lymphocytic), through Cellulose Membrane Filters Relation of Invasive Capacity to Passage of (Dr Emma Shelton and Dr Mary E Rice), 479
Cells (Mammalian), in Culture X-Ray Damage and Recovery in (M M Elkind and Harriet Sutton), 1293
Cells (Mouse Ascites Tumour) Growth Inhibition of, by Powdered Tragacanth (Tragacanthae Pulvis, B P), (Dr E M F Roe), 1891
Cells (Multiplying HeLa) Deoxyribonucleic Acid Formation in (C L Smith, A A Newton and P Wildy), 107
Cells (Muscle), of *Ascaris lumbricoides* Electrical Activity in the (Dr M Jarman), 1244
Cells (Nerve), in the Ferret Pituitary Gland A Nucleus of (Dr R L Holmes), 1819
Cells (Normal and Cancer) Localization of β-Glucuronidase in (J Conchie and Dr G A Levvy), 1709
Cells (Parenchymatous Liver) Some Enzymatic Properties of Suspensions of (Dr Keith S Henley Ole Sorensen and H Marvin Pollard), 1400
Cells (Polyethylene Absorption), for Infra-Red Spectrophotometry (Trevor Robinson), 448
Cells (Proliferating Donor), in Chick Embryos injected with Adult Chicken Blood Cytological Identification of (P M Biggs and L N Payne), 1594
Cells (Purkinje Nerve), of some Mammals Sex Chromatin ('Chromoleme') in the (Nylceo Marques de Castro and Wilson da Silva Sasso), 293
Cells (Rat Mast) Release of Histamine from, by Blood treated with Dextran (Dr G T Archer), 1151
Cells (Red Blood) Coating of with Antigenic Substances (Dr K Deutsch), 278
Cells (Shielded), (Glove Boxes and), for Handling Radioactive Materials—a Record of the Proceedings of the Symposium on Glove Box Design and Operation held in the Cockcroft Hall, A E R E, Harwell, 1957 (edited by G N Walton), *review*, 1599
Cells (Single Living) Localization and Assay of Respiratory Enzymes in—Absorbancy Measurements on the *Nebenkern* (Dr Robert P Perry, Dr Bo Thorell, Dr Lennart Akerman and Prof Britton Chance), 929, Fluorescence Measurements of Mitochondrial Pyridine Nucleotide in Aerobiosis and Anaerobiosis (Prof Britton Chance and Dr Bo Thorell), 931, Absorbancy Measurements on Liver and Kidney Cells (Dr Bo Thorell and Prof Britton Chance), 934
Cells (Tobacco Leaf), capable of supporting Virus Multiplication Isolation of (Prof Milton Zaitlin), 1002
Cells (Tumour), induced by Polyoma Formation of Different Cell-Virus Relationships in (Dr Leo Sachs and Ernest Winocour), 1702
Cells (White Blood), of Rats (*WR* Strain) A Sex Difference in (Dr Hans Meier), 1082
Cells (Yeast) Release of Nucleotides from (Masataka Higuchi and Prof Teijiro Uemura), 1381
Cellular Blood Elements (Injured), in Extracorporeal Circuits Release of Adenosine Triphosphate and Serotonin from (Dr H S S Sarajas, Dr R Kristoffersson and Dr M H Frick), 1127
Cellular Calcium Heparin and (D Thomason and R Schofield), 1712
Cellular Hyperplasia Viral Multiplication and (Prof Councilman Morgan), 435
Cellular Slime Molds (Prof John Tyler Bonner), *review* by D Park, 1976
Cellular Uptake of Deoxyribonucleic Acid by Human Tissue Culture Cells (Dr Stanley M Gartler), 1505
Cellulose Anion Exchangers based on (Dr A O Jakubovic), 1065
  Evidence for a Hydrate of from Studies of its Surface Properties (Dr J M Joubert, Dr G J R Krige and Dr K Borgin), 1561
Cellulose Acetate Cross-linking of, by Ionizing Radiation (Dr S H Pinner, T T Greenwood and D G Lloyd), 1303
Cellulose Film (Transparent) Use of, for Roller Tube Tissue Cultures (John A Sharp) 1508
Cellulose Membrane Filters Relation of Invasive Capacity to Passage of Lymphocytic Cells through (Dr Emma Shelton and Dr Mary E Rice), 479
Cellulosic Fibres A Special Case of the Superposition of Crystal Plates between Crossed Polars and its Bearing on the Microscopy of (Dr N H Hartshorne), 179
Cement (Hydrated Portland) Carbonate Minerals in (W F Cole and B Kroone), B A 57
Cenozoic Volcanic Rocks in New Zealand Palaeomagnetic Studies of (Dr D S Coombs and Dr T Hatherton), 883
Census 1951, England and Wales Fertility Report, 1035
Centenary of the Petroleum Industry, 1611

Central Advisory Water Committee First Report of the Subcommittee on the Growing Demand for Water, B A 18
  Report of the Subcommittee on Information on Water Resources, B A 18
  Re-appointments and new appointments, 153
Central African Scientific Research 407
Central Agricultural Research Station, Carapichaima, Trinidad (Dr A J Vlitos), 331
Central Congo Basin Nitrogen Content of Rain Water collected in the Humid (J Meyer and E Pampfer), 717
Central Control of Interactions between Behaviour Patterns in a Hemileucine Moth (Dr A D Blest), 1164
Central Electricity Generating Board Grant of £3,860 to the University of Leeds, for research on the utilization of pulverized fuel ash, 1534
Central Nervous System Biochemistry and the (Prof Henry McIlwain), second edition, *review* by Dr G B Ansell, 1261
Central Nervous System of the Carp *Glaucoma* Species in the (Prof A Stolk), 1737
Central Youth Employment Executive Pharmacy as a Career, 95
Centre (The Iron-Binding), of Ferrichrome Compounds (Dr T Emery and Dr J B Neilands), 1632
Centre Interuniversitaire de Recherches enzymologiques Colloquium on Specificity in Protein Biogenesis, 1198
Centre National de la Recherche Scientifique Colloques Internationaux, No 84, Acoustique Musicale (Marseilles, 1959), *review* by Prof E G Richardson, 1902
Centrifuge Super-speed Servall *SS*-3 Automatic (Ivan Sorvall, Inc), 322
  SS-4 Enclosed (Ivan Sorvall, Inc), 322
Cephalopoda (Fossil) Conchiolin Remnants in Mother-of-Pearl from (Dr Ch Gregoire), 1157
Cephalosporia Light-induced Production of Carotenoid Pigments by (R C Codner and B C Platt), 741, *erratum*, 1108
Ceramic Research Association (British) New Mellor Library opened by Frank West, 153
  Symposium on Special Ceramics, 1115
  Retirement of Dr A T Green from the directorship, 1843
  Appointment of Dr N F Astbury as director, 1843
Ceramics Special (British Ceramic Research Association Symposium on), 1115
Cerebrospinal Fluid (Human) Glycoproteins of (Dr Samuel Bogoch), 1628
Cerebrospinal and Ocular Fluids and Tissues of the Foetal and Adult Sheep Inositol Concentration in the (D A Nixon), 906
Cerebrospinal Fluid and Urine α-Ketoglutaric Acid and Pyruvic Acid in Blood, (Dr E Zelnicek), 727
Cerenkov Radiation and its Applications (Dr J V Jelley), *review*, 1260
Cerium-142 α-Radioactivity of (F E Senftle, T W Stern and V P Alekna), 630
Cerletti, Dr A (Taeschler, Dr M , and) Differential Analysis of the Effects of Phenothiazine-Tranquillizers on Emotional and Motor Behaviour in Experimental Animals, 823
CERN see under European Organization for Nuclear Research
Chabod, Federico Elected an Honorary Member of the American Academy of Arts and Sciences, 410
Chabot, D L (Beaudry, J R , and) Chromosome Numbers in *Solidago*, 236
Chadwick, P Appointed lecturer in applied mathematics at the University of Sheffield, 684
Chadwick, Dr W B Prediction of Sunspot Numbers for Cycle 20, 1787
Chagas as Protozoologist, 1115
Chagas's Disease International Congress on (Dr J D Fulton), 1114
Chaiet, Alan H , and Chaiet, Louis Estimation of Vitamin C by Agar Diffusion, 1487
Chaiet, Louis (Chaiet, Alan H , and) Estimation of Vitamin C by Agar Diffusion, 1487
Chain (Respiratory), in Liver Mitochondria Functional Organization of the (Dr Tokuji Kimura and Dr Thomas P Singer), 791
Chain Fracture and Cross-Linking of Rubber by High-Energy Radiation Estimation of (P Hayden), 1865
Chain Reactors (Neutron) The Physical Theory of (Alvin M Weinberg and Eugene P Wigner), *review* by Dr J Walker, 1973
α-Chains Haemoglobin 'Bart's', a Foetal Haemoglobin without (Abnormal Human Haemoglobins), (Dr J A Hunt and Dr H Lehmann), 872
Chakraborty, S P , and Sen Gupta, S P Fixation of Nitrogen by the Rice Plant, 2033
Chakravorty, Animesh, and Basu, Dr Sadhan Visible Absorption Spectra of Copper-ethylene-diamine-*bis* (acetylacetone) in the Crystalline State, 50
Chakravorty, M , and Burma, D P Biochemical Research in India (Microbial Synthesis of Protein in relation to the Biogenesis of Nucleic Acids), 1367
Challenge of Science Education (edited by Joseph S Roucek), *review* by Dr W L Sumner, 923
Challenger, Prof Frederick *Obituary* of Prof H J Backer 1187
Challenger Society Joint Meeting with representatives from the marine laboratories (Development Commissioners' scheme), 410
Chaloner, W G Origin and Dispersal of Flowering Plants (Carboniferous Plants with Spores could be poorly represented as Macro-fossils), 1200
Chaloupka, J , and others Influence of DL-beta-Phenylserine on the Synthesis of Proteins in *Escherichia coli*, 1895
Chamberlain, Dr Owen (Segre, Dr Emilio, and) Awarded the Nobel Prize for Physics for 1959, 1189 , work of, 1189
Chambon, Pierre (Mandel, Prof Paul, and) Biological Effects of Low Doses of Ionizing Radiations (Ribonucleic Acid Synthesis in Rat Spleen after Whole-body Irradiation), 1112
  A New Approach to the Mechanism of Mutations, 1501
Champion, Dr F C Title of professor of experimental physics in the University of London (at King's College) conferred on, 1613
Champion, Sir Harry Forestry in New Zealand, 606
Chance, Prof Britton, and Jobsis, Frans Changes in Fluorescence in a Frog Sartorius Muscle following a Twitch, 195
Chance, Prof Britton, and Spencer, E L Energy Transfer with special reference to Biological Systems (Rapid Establishment of Redox Equilibria in the Cytochromes of Cells and Cell Particles at the Temperature of Liquid Nitrogen), 690
Chance, Prof Britton and Thorell, Dr Bo Localization and Assay of Respiratory Enzymes in Single Living Cells—Fluorescence Measurements of Mitochondrial Pyridine Nucleotide in Aerobiosis and Anaerobiosis, 931
Chance, Prof Britton and Yonatani, T Energy Transfer with special reference to Biological Systems (Fast Simultaneous Recordings of Cytochrome Oxidation and Disphosphopyridine Nucleotide Reduction), 690
Chance, Prof Britton, and others Localization and Assay of Respiratory Enzymes in Single Living Cells—Absorbancy Measurements on the *Neberkern*, 929
Chance, Prof Britton (Thorell, Dr Bo, and) Localization and Assay of Respiratory Enzymes in Single Living Cells—Absorbancy Measurements on Liver and Kidney Cells, 934
Chance Memorial Lecture of the Society of Chemical Industry (Dr W M Hampton), 772
Chance and Probability (British Association for the Advancement of Science, Section J (Psychology), Discussion on), 497
Chandrasekhar, Dr N Multiple Haemoglobins in Fish, 1652
Chang, Prof C C (Sedlund, F R , and) Blunt-Nosed Bodies in a High-Temperature Gas Jet, 812
Chang, Dr M C Fertilization of Rabbit Ova *in vitro*, 466
Chang, Y E (Westheimer, Prof F H , and) Oxidation of Organic Compounds (Oxidation of Pinacol and its Monomethyl Ether), 326
Change of Absorption Spectrum of Flavin Adenine Dinucleotide by its Binding with both D-Amino Acid Oxidase Apo-Protein and Benzoate (Dr Kunio Yagi, Takayuki Ozawa and Minoru Harada), 1938
Change of Cosmic Rays in Space (Prof H V Neher), 423
Change (Malignant), with Deoxyribonucleic Acid from Rat Sarcoma and Hepatoma An Attempt to produce (Dr J G Bearn), 824
Change (Simultaneous), in both Differential and Interference Distances of Chiasmata (Dr J Yanney Wilson), 207
Change (Technological) Personnel Management and (Institute of Personnel Management Annual Conference), 1614
Changes in Adenosine Di- and Tri-phosphate Concentrations in the Early Stages of the Action of Yeast on Glucose (Dr J O Laws and Dr L H Stickland), 1246
Changes in the Climate of the Atlantic–European Area and Secular Solar Activity (Z Gregor and L Křivsky), 682
Changes in Fluorescence in a Frog Sartorius Muscle following a Twitch (Prof Britton Chance and Frans Jobsis), 195
Changes in Keratin and the Analogy with Muscle Contraction Permanent Set, Supercontraction and Urea-Bisulphite Solubility—the Proton-Transfer Nature of some (Dr P T Speakman), 339
Changes in the Lacunal Parenchyma of *Mimosa pudica* in Diurnal and Nocturnal Conditions (Hideo Toriyama), 737
Changes in the Level of Serum Protein during Treatment of Kwashiorkor (Dr Olumbe Bassir), 2019
Changes in Purine Nucleotides of Red Lateral Muscle of Rainbow Trout (Tsuneyuki Saito, Ken-ichi Arai and Toshikatsu Yajima), 1415
Changes (Chemical), associated with Diapause in the European Corn Borer, *Ostrinia nubilalis* (Hbn) (Lepidoptera Pyralidae), (J A Mutchmor and J H Maruzek), 1077
Changes (Cosmic Ray Energy Spectrum) Evidence for, during a Forbush Decrease (K W Ogilvie and M M Winn), 888
Changes (Electrical Resistivity), observed in a Semiconducting Diamond after Heat Treatment (R E Mutch and Dr F A Raal), 1857
Changes (Hybridization) Effect of, on the Bond Energies of Carbon–Carbon Single Bonds (J E Bloor and S Gartside), 1313
Changes (Metabolic), induced in Mammalian Erythrocytes by Whole-Body X-Irradiation (Prof D A Rappoport and B W Sewell), 846
Changes (Post-activation), at the Mammalian Neuromuscular Junction (J I Hubbard), 1945
Changes (Quantitative), in γ-Aminobutyric Acid induced by Low Temperature in Rice Plants (F Zsoldos), 280
Changes (Seasonal), in the Œstrous Response by the Ovariectomized Ewe to Progesterone and Œstrogen (Prof J I Raeside and M F McDonald), 458
Changing Concepts of Management Relationships in Industry—some (British Institute of Management and the Ministry of Labour Conference on), 156
Chantrenne, Prof H Enzymes (Present Status of the Investigation of the Mechanism of Protein Synthesis), 688
  Protein Biogenesis 1198
Chapman, Dr Brian The Profession of Government—the Public Service in Europe, 127
  The Profession of Government, 1087
Chapman, Prof Kent M , and Pearce, Prof James W Vagal Afferents in the Monkey, 1237
Chappell, Dr J B Enzymes—Kinetics and Chemistry, *review*, 388
Characteristics of Glucose-6-phosphate Dehydrogenase from Normal and Primaquine-sensitive Erythrocytes (Glucose-6-phosphate Dehydrogenase and Human Erythrocytes), (Dr Henry N Kirkman), 1291
Characteristics (Chromatographic and Biological) of Fish and Frog Neurohypophysial Extracts (Active Principles of the Neurohypophysis of Cold-blooded Vertebrates), (B T Pickering and Prof H Heller), 1463
Characterization (A Partial Chemical), of Maize Coleoptile Cell Walls prepared with the Aid of a Continually Renewable Filter (Prof Aleksander Kivilaan, Teofila C Beaman and Robert S Bandurski), B A 81
Characters associated with Parasitism in Gram-Positive Bacteria (Dr B A Bisset), B A 29
Characters (Complex) Heterosis and the Genetics of (Watkin Williams), 527
Charcoal (Activated) Carbonization of Coals in the Presence of (Studies of Coal), (R L Bond, A M Godridge, A R Murnaghan, D H Napier and D J Williams), 425
Charcoal and Clays (Activated) Insecticidal Effects of (S K Majumder, K S Narasimhan and V Subrahmanyan), 1165
Chargaff, Prof Erwin (Horowitz, Dr Jack, and) Massive Incorporation of 5-Fluorouracil into a Bacterial Ribonucleic Acid, 1213
Charges Research and Development, in Civil Nuclear Power, 406
Charges of the Electron, Proton and Neutron A Comparison of the (A M Hillas and T E Cranshaw), 892 , (Prof H Bondi and Dr R A Lyttleton), 974

Charig, Dr A J (Francis, Dr G H, and) Return of, from the British Museum (Natural History) Expedition to South Peru, 1687
Charing Cross Hospital Medical School, London Appointment of A H J Rains to the chair of surgery, 322
Charities and Kindred Bodies Report of the Committee on the Rating of, 1343
Charles, R J Atomic Mechanisms of Fracture (Dependence upon Time of the Strength of Silicate Glasses under Static Loading), 324
Charleston, W A G Awarded a Research Training Scholarship by the Animal Health Trust, 771
Charlton, T M Engineering Statics, *review*, 1674
  Theory of Beams, *review*, 1976
Charnley, John Biomechanics (Nature of Lubrication in Animal Joints), 513
Charnockites A Re-interpretation of (A P Subramaniam), 321
Chars (Low-Temperature) Smoke Emission from Coal and (Studies of Coal), (D Finch), 426
Chatt, Dr J, and others Structure of α-Hydroxyacetylene Complexes of Platinum (II), 526
Chattaway, Dr F W, and others Effect of Steroids and related Compounds on the Growth of Dermatophytes, 1731
Chavez, Carlos Elected an Honorary Member of the American Academy of Arts and Sciences, 410
Cheddar Cheese Tallowy Discoloration in—Fat Oxidation and Trace Metals in Cheese (F Bishop), 1295, Fat Oxidation and Haematin Systems in Cheese (C G Rammell), 1296
Cheese Fat Oxidation and Haematin Systems in (Tallowy Discoloration in Cheddar Cheese), (C G Rammell), 1296
Cheese Fat Oxidation and Trace Metals in (Tallowy Discoloration in Cheddar Cheese), (F Bishop), 1295
Cheese (Cheddar) Tallowy Discoloration in—Fat Oxidation and Trace Metals in Cheese (F Bishop), 1295, Fat Oxidation and Haematin Systems in Cheese (C G Rammell), 1296
Cheesman, Dr D F Appointed to the University of London readership in biochemistry at Bedford College, 595
Chelating Theory (Copper), of their Mode of Action Plant-Growth Substances and the (Dr C H Fawcett) 796
Chemical Abnormality in Haemoglobin *G* (Dr Robert L Hill and Dr Herbert C Schwartz), 641
Chemical Activities of *E coli* adsorbed on a Resin, 'Dowex-1' (Tsutomu Hattori and Choseki Furusaka), 1566
Chemical Aeronomy Proceedings of the Conference sponsored by the Geophysics Research Directorate, Air Force Cambridge Research Center, Cambridge, Mass, 1956 (edited by M Zelikoff), *review*, 1011
Chemical Analysis Classical, *review* by Dr William I Stephen, 1756
  Soil (Prof M L Jackson), *review* by J M Bremner, 1093
Chemical Analysis of Foods and Food Products (Dr Morris B Jacobs), third edition, *review* by Dr V H Booth, 1347
Chemical Changes associated with Diapause in the European Corn Borer, *Ostrinia nubilalis* (Hbn) (Lepidoptera Pyralidae), (J A Mutchmor and J H Maruzek), 1077
Chemical Characterization (A Partial), of Maize Coleoptile Cell Walls prepared with the Aid of a Continually Renewable Filter (Prof Aleksander Kivilaan, Teofila C Beaman and Robert S Bandurski), B A 81
Chemical Control of Eelworms in Strawberries (R S Pitcher), 25
Chemical Dosimeter (A Sensitive), for Ionizing Radiation (Prof Gerald Oster and Dr Barret Broyde), 545
Chemical Effect of Ethylene during the Storage of Peas (Prof Frank A Lee), 462
Chemical Effect of Gene Mutation Human Haemoglobin *E*—the (Abnormal Human Haemoglobins), (Dr J A Hunt and Dr V M Ingram), 870
Chemical Energy Conversion of Light into, in Photosynthesis (Prof Daniel I Arnon), 10, *errata*, 1613
Chemical Engineering in Britain Progress of (Sir Hugh Beaver), 408
Chemical Engineering at Leeds, 1106
Chemical Engineering Scheme for a Full-time Course in (Institution of Chemical Engineer, 856
Chemical Engineering Practice (edited by Herbert W Cremer and Trefor Davies), Vol 6, Fluid Systems II, *review* by Prof J M Coulson 132
Chemical Engineers, Institution of Presidential Address (Sir Hugh Beaver), 408
  Scheme for a Full-time Course in Chemical Engineering, 856
Chemical Industry, Society of Fifth Chance Memorial Lecture (Dr W M Hampton), 772
  Fifth Levinstein Memorial Lecture (L H Williams), 1915
Chemical Industry, Society of (Food Group) Symposium on Enzymes in the Food Industry, 1366
Chemical Institute, Royal Australian Election of C E C Nicholls as president, 1106
Chemical Kinetics and Reactivity Some Problems in (N N Semenov), Vol I (translated by Michael Boudart), *review* by Dr T M Sugden, 299
Chemical Laboratory, National Retirement of Dr D D Pratt from the directorship, 1610
  Appointment of Prof J S Anderson as director, 1610
  Report for 1958, 1779
Chemical Nature of a Plant-Virus Inhibitor from Rice (W A Jones, M Jacobson and R P Kahn), 1146
Chemical Observation Phylogeny of the Genus *Aniba* Aubl—a Comparative Morphological and (Walter B Mors, Otto Richard Gottlieb and Ida de Vattimo), 1589
Chemical Oceanography, *review* by F A J Armstrong, 299
Chemical Processing of Nuclear Fuels (Dr F S Martin and Dr G L Miles), *review* by Dr J E Littlechild, 1346
Chemical Reactions (Fast), in Solution (Deutsche Bunsengesellschaft fur Physikalische Chemie and the Max-Planck Gesellschaft Colloquium on), 1453
Chemical Reactions (Fast), in Solution (Bunsengesellschaft fur physikalische Chemie and the Max-Planck Gesellschaft Colloquium on), 1453
Chemical Society Publication of a translation of the Russian *Zhurnal Neorganicheskoi Khimii* under the title *Russian Journal of Inorganic Chemistry*, 319
  Research Fund Grants, 857
  Proceedings of a Symposium on Steric Effects in Conjugated Systems, held at the University, Hull, 1958 (edited by Dr G W Gray), *review* by Dr G Eglinton, 1522
Chemical Studies (Metabolic and), of 'Myleran'—Formation of 3-Hydroxytetrahydrothiophene-1,1-dioxide *in vivo*, and Reactions with Thiols *in vitro* (Dr J J Roberts and Dr G P Warwick), 1288
Chemical Warfare Pugwash International Conference of Scientists—Statement on Biological and, 1018
Chemicals from Petroleum The Future of (L H Williams), 1915
Chemie (Physikalische), Deutsche Bunsengesellschaft fur, and the International Union of Pure and Applied Chemistry) Symposium on Thermodynamics, 1606
Chemie (Physikalische), Deutsche Bunsengesellschaft fur, and the Max-Planck Gesellschaft Colloquium on Fast Chemical Reactions in Solution, 1453
Chemisorbed Films in Electron Emission Microscopy Field Effects on (R J Hill and P W M Jacobs), 895
Chemistry Advanced Analytical (Prof Louis Meites and Prof Henry C Thomas), *review* by W I Stephen, 1525
  Analytical (edited by M T Kelley), Vol I, *review* by G W C Milner, 1524
  Analytical (A G Jones) *review* by Dr A M G Macdonald, 1677
  Awards of new Fellowships in, for 1959-60 (Ramsay Memorial Fellowships Trustees) B A 16
  Chymia—Annual Studies in the History of, Vol 5 (edited by Henry M Leicester), *review* by Prof J R Partington, 1900
  Comprehensive Analytical (edited by Prof Cecil L Wilson and David W Wilson), Vol Ia, Classical Analysis, *review* by Dr William I Stephen, 1756
  Heterocyclic (Prof Adrien Albert), *review* by Dr F. G Mann, 216
  Heterocyclic, *review* by Dr F G Mann, 1758
  Modern Inorganic, *review* by Dr D W A Sharp, 1756
  Old, *review* by Prof J R Partington, 1900
Chemistry at Bedford College, London, 1913
Chemistry at the Royal College of Science and Technology, Glasgow, 233
Chemistry in the Eighteenth Century (Dr Andrew Kent), 1452
Chemistry, Royal Institute of Meldola Medal for 1960, 1192
  Index of Chemistry Films, *review*, 1902
  Monographs for Teachers, No 1, Principles of Electrolysis (Prof C W Davies), *review* by Dr V Gold, 1902, No 2, Principles of Oxidation and Reduction (Dr A. G Sharpe), *review* by Dr V Gold, 1902
Chemistry of Carbon Compounds (edited by Dr E H Rodd), Vol 4, Part B, Heterocyclic Compounds, *review* by Dr F G Mann, 1758
Chemistry of Clothing (British Association for the Advancement of Science, Section B (Chemistry), Symposium on), 849
Chemistry of Glasses, Physics and (Society of Glass Technology), 855
Chemistry of Heterocyclic Compounds Vol 13, *s*-Triazines and Derivatives (edited by Edwin M Smolin and Lorence Rapoport), *review* by Dr F G Mann, 1758
Chemistry of Natural Products Vol 1, The Alkaloids (K W Bentley), Vol 2, Mono- and Sesquiterpenoids (P de Mayo), Vol 3, The Higher Terpenoids (P de Mayo), *review* by Prof A J Birch, 754
Chemistry of the Non-Metals Newer Developments in the (Kingston Technical College Course of Lectures on), 1915
Chemistry of Phosphorus, *review* by Dr F G Mann, 389
Chemistry in the Preservation of Antiquities (British Association for the Advancement of Science, Sections B (Chemistry) and H (Anthropology), Discussion on), 585
Chemistry of Propellants (Combustion and Propulsion Panel of the Advisory Group for Aeronautical Research and Development Discussion on), 778
Chemistry of Proteins The Structure and (Commonwealth Scientific and Industrial Research Organization Symposium on), 1276
Chemistry of Synthetic Drugs (May's), revised and rewritten by Dr G Malcolm Dyson, in consultation with Dr Percy May, fifth edition, *review* by F R Batchelor, 1597
Chemistry of Vegetable Tannins—Being the Papers presented at a Symposium held in the University, Cambridge, 1956, under the auspices of the Society of Leather Trades' Chemists, *review* by Dr A I Scott, 1832
Chemistry (Agricultural), in Aberystwyth, 317
Chemistry (Analytical) *Talanta* Medal for outstanding contributions to, 856
Chemistry (Analytical), at Birmingham, 679
Chemistry (Analytical), in Nuclear Reaction Technology Third Conference on, 26
Chemistry (Biophysical) Progress in Biophysics and (edited by Prof J A V Butler and Prof B Katz), Vol 9, *review* by P A Merton, 1092
Chemistry (Carbohydrate) Advances in (edited by Melville L Wolfrom in association with R Stuart Tipson), Vol 13, *review* by Dr Alfred Gottschalk, 662
Chemistry (Enzyme) Outlines of (Dr J B Neilands and Dr Paul K Stumpf), second edition, *review* by Dr Edwin C Webb, 1759
  Proceedings of the International Symposium on (Tokyo and Kyoto, 1957), (Science Council of Japan, under the auspices of the International Union of Biochemistry), *review* by Dr J B Chappell, 388
Chemistry (High Polymer) New Techniques in (Bradford Institute of Technology Course in) 1845
Chemistry (Inorganic), Russian Journal of (A translation of the Russian *Zhurnal Neorganicheskoi Khimii*, published by the Chemical Society), 319
Chemistry (Inorganic), and Radiochemistry Advances in (edited by H J Emeleus and A G Sharpe), Vol 1, *review* by Dr D W A Sharp, 1756
Chemistry (Organic) Progress in (edited by Dr J W Cook), Vol 4, *review* by Dr K H Overton, 1439
Chemistry (Polymer) Recent Progress in (Prof H Mark), 156
Chemistry (Polysaccharide) Application of the Mass Spectrometer to (Dr P A Finan and Dr R I Reed), 1866
Chemistry (Pure and Applied), International Union of Meeting of the Commission on Geochemistry, 1193
  Election of members of the Commission on Geochemistry, 1193
  Election of Prof C W Correns as president for 1960 of the Commission on Geochemistry, 1193
Chemistry (Pure and Applied), International Union of (Committee of the Analytical Chemistry Section) Nomenclature in Titrimetric Analysis, 1686
Chemistry (Pure and Applied), International Union of (Commission on Macromolecules) International Symposium on Macromolecules, 1689

Chemistry (Pure and Applied), International Union of (Deutsche Bunsengesellschaft fur Physikalische Chemie and the) Symposium on Thermodynamics, 1606
Chemistry (Textile) Recent Developments in (Bradford Institute of Technology, the Bradford Chemical Society and the Yorkshire Council for Further Education Symposium on), 1845
Chemistry Films Index of (Royal Institute of Chemistry), *review*, 1902
Chemistry and Biochemistry of Natural Products Steric Aspects of the (Biochemical Society Symposium on), 947
Chemistry and Pharmacology of 16-Acetyl Digitalinum Verum (Z Kanda, Prof A Sekiya, K Katayama, A Okano and T Miki), 1414
Chemistry and Taxonomy in the Dipterocarpaceae (Dr E C Bate-Smith and Dr T C Whitmore), 795
Chemotherapeutic Activity (Antiviral), of Isatin β-thiosemicarbazone in Mice infected with Rabbit-pox Virus (D J Bauer and F W Sheffield), 1496
Chemotherapy The Strategy of—Eighth Symposium of the Society for General Microbiology, 1958 (edited by S T Cowan and E Rowatt), *review* by Prof H Berry, 133
Chemotropic Response from Photopositive Domination in a Scolytid Beetle Release by Flight Exercise of a (Prof Kenneth Graham), 283
Cheng, Chung-Chih, and others Transistor Electronics, *review* by J W R Griffiths, 838
Cheng, Dr Ping-yao High Molecular Weight Ribonucleic Acids from the Nuclei of Calf Thymus, 190
Chenopodium (Tourn) L (Genus) Extreme Sensitivity of Germination and Photoperiodic Reaction in the (Dr Bruce G Cumming), 1044
Cherries (Sour and Sweet) Occurrence of Leuco-Anthocyanin in (Dr Kuang C Li), 1935
Cherry, Prof Colin From Microphone to Ear, *review*, 841
Chervinsky, J (Yashouv, A , and) Hybrids of *Tilapia nilotica* x *T galilea*, 1739
Cherwell, Lord The Prof—a Personal Memoir of (Sir Roy Harrod), *review* by Prof R V Jones, 1752
Chester, V E Effect of Oxygen on Endogenous Metabolism of a Respiratory-deficient Brewer's Yeast, 1956
Chevallaz, Dr G At the 139th Annual Meeting of the Swiss Society for Natural Sciences (Preparations for the Swiss National Exhibition at Lausanne in 1964), 1454
Chevallier, A , and Manuel, S Biological Effects of Low Doses of Ionizing Radiations (Drop in the Ascorbic Acid Content of almost all Tissues, particularly the Spleen), 1112
Chew, Prof G F Nuclear Forces and the Few-Nucleon Problem (The Primary Two-Nucleon Interaction), 1113
Chhotani, O B (Roonwal, Dr M L , and) New Neotropical Element (*Anoplotermes*) in Indian Termite Fauna, 1967
Ch'iang The Customs and Religion of the (D C Graham), B A 15
Chiasmata Simultaneous Change in both Differential and Interference Distances of (Dr J Yanney Wilson), 207
Chicago Natural History Museum Fieldiana, Botany, Vol 30, No 2, Orchids of Peru (C Schweinfurth), 409
    Fieldiana, Botany, Vol 24, Part I, Flora of Guatemala (Paul C Standley and Julian A Steyermark), 771
Chiche, P , and Pregermain, S Coal Science (Ultra-fine Structure of Coals and Chars), 413
Chick, D R Ionization Phenomena in Gases (Design and Engineering of the Machine to be known as *Sceptre IV*), 1356
Chick A Chimaeric Duck with the Head of a (Tamikazu Seno and Saburo Saito), B A 78
Chick Blastoderm (De-embryonated) 8-Azaguanine Inhibition of Haemoglobin Synthesis in (B R A O'Brien), 376
Chick Embryo Inhibition of Skeletal Formation in the, following Administration of Tetracycline (Gerrit Bevelander, Hiroshi Nakahara and Gloria K Rolle), 728
Chick Embryos injected with Adult Chicken Blood Cytological Identification of Proliferating Donor Cells in (P M Biggs and L N Payne), 1594
Chick Growth Factors Unidentified (J A Wakelam and W P Jaffe), 272
Chick Mesenchymal Tissue Production of Serum Albumin and of Globulins by, and by HeLa Tumour Tissue in Culture (Y Abdel-Samie, Prof E Broda, G Kellner and W Zischka), 361, *erratum*, 943
Chicken Blood (Adult) Cytological Identification of Proliferating Donor Cells in Chick Embryos injected with (P M Biggs and L N Payne), 1594
Chicken Embryos Combined Effects of Cortisone and Insulin on Developing (Dr Pietro de Franciscis and Prof Walter Landauer), 101
Chieffi, G , and others Haemoglobin Pattern of the Cyclostome *Pertromyzon planeri* during the Course of Development, 1325
Child, K J , and others Spectrophotofluorometric Assay of Griseofulvin, 364
Child (School) The Health of the—Fifty Years of the School Health Service (Report of the Chief Medical Officer of the Ministry of Education for 1956 and 1957), 98
Children (Handicapped), in Britain—their Problems and Education (compiled by W A Axford), (Library Association), 1777
Chilling Requirements of Peach Seeds Gibberellic Acid and the (the late Prof Margaretha G Mes), 2034
Chimaeric Duck with the Head of a Chick (Tamikazu Seno and Saburo Saito), B A 78
China, Dr W E The Insect Pests of Cotton in Tropical Africa, *review*, 1011
China The Development of Iron and Steel Technology in (Dr Joseph Needham), *review* by Prof F C Thompson, 1830
    A History of Iron and Steel in, *review* by Prof F C Thompson, 1830
Chinese Scientific Literature, 681
Chisholm, A Awarded an Overseas Scholarship by the Royal Commission for the Exhibition of 1851, 409
Chisholm, Dr Brock, and others Statement on Biological and Chemical Warfare, 1018
Chisholm, Margaret, and Jacob, Dr L Current Fluctuations in the Oxide Cathode, 1058
Chlorella Tabular Comparative Data for the Low- and High-Temperature Strains of (Dr Constantine Sorokin), 613
Chlorella pyrenoidosa Macromolecular Components of (Philip Newmark, Jack D Stephens, James B Curry and Gail L Bower), 963
Chloride (Anhydrous Aluminium) A New Method for Working up Processing Mixtures containing (Dr T Szell and A Furka), 117, *erratum*, 595
Chloride (Mercuric) Reaction of, with Plasmalogen (Dr William T Norton), 1144
Chloride (Polyvinyl), and Polyvinyl Acetate Separation of, by Chromatographic Methods (W J Langford and D J Vaughan), 116
Chloride (Sodium) Intake and Urinary Histamine in Adrenalectomized Rats (Dr T Bjuro and Dr H Westling), 1241
Chloride (*d*-Tubocurarine) Increase by Chlorothiazide of the Paralysing Activity of (Prof W Ferrari, G L Gessa and G Sangiorgi), 1235
    Induced Tolerance to, in the Cat (Fiona Acheson and Dr R J M Fry), 1409
Chlorides (Phosphonitrilic) Polymerization of (Prof Thomas R Merton), 899
Chlorine in Muscle Tissues Determination of, by Neutron Activation Analysis (Dr Jonas Bergstrom), 1504
Chloroform A Concave Concentration Gradient of Ethanol in, employed in Elution of Lipids from Silicic Acid (J J Wren), 816
Chloroplast Pigments of Deuterated Green Algae (Harold H Strain, Henry L Crespi and Joseph J Katz), 730
Chloroplasts (Isolated) Destruction of Carotenoids in (J Friend and T O M Nakayama), B A 66
Chlorothiazide Increase by, of the Paralysing Activity of *d*-Tubocurarine Chloride (Prof W Ferrari, G L Gessa and G Sangiorgi), 1235
Chlorpromazine Abolition by, of the Inhibiting Effect of Iproniazid on the Depletion of Adrenal Catechol Amines induced by Reserpine (F Camanni Dr G M Molinatti and M Olivetti), B A 65
    Effect of, on Crocker Sarcoma and Ehrlich Ascites Carcinoma (Prof M Chorazy), 200
    Effect of, upon Isolated *d*-Amino-Acid Oxidase Systems (Dr Andrew Lasslo and Anne L Meyer), 1922
Chlorpromazine with Flavins Complex Formation of (Dr Kunio Yagi, Takayuki Ozawa and Toshiharu Nagatsu), 982
Chmurzynska, Wanda, and Wojtczak, Lech Interaction between Thiourea and Insect Polyphenoloxidase, 1941
Cholesterol in House Fly Reproduction Rôle of (Ronald E Monroe), 1513
Cholesterol (Plasma), in the Rat Effect of Dietary Fat and Extent of Blood Sampling on the Level of (I Coleman and J M R Beveridge), 1039
Cholesterol (Serum), in Rats Dietary Protein and (A P de Groot), 903
Choline Acetylase Action of Ganglion Blocking Drugs on (Dr J E Gardiner) B A 71
Cholinergically Innervated Sweat Glands Response of, to Adrenaline and Noradrenaline (Dr David P C Lloyd), 277
Chollet, P (Tardif, H P , and) Dynamic and Static Deformation of Armco Iron, 1917
Chondroitin Sulphates Biosynthesis of (J B Adams), 274
Chopra, Prof C H Cytochemical Study of Mitochondrial Structure, 656
Chorazy, Prof M Effect of Chlorpromazine on Crocker Sarcoma and Ehrlich Ascites Carcinoma, 200
Chowdhury, K A Origin and Dispersal of Flowering Plants (Angiosperms in various Tertiary Floras of India), 1201
Chree (Charles) Lecture of the Physical Society (Sir Edward Bullard) ,954
Christensen, B Asexual Reproduction in the Enchytraeidae (Olig), 1159
Christensen, Dr E H Ergonomics, its Place in Industry, B A 21
Christian, C S Appointed a member of the Executive of the Australian Commonwealth Scientific and Industrial Research Organization, 1984 , work of, 1984
Christie, Dr Jesse R Plant Nematodes, *review* by Dr W G Inglis, 1349
Christmas, A N Promoted to Deputy Chief Scientific Officer and appointed director of Guided Weapons (Techniques) at the Ministry of Aviation Headquarters, 1775 , work of, 1775
Christmas Holiday Lecture of the Institution of Electrical Engineers (G G Gouriet), 1535
Christmas Lectures (Science Museum, London), 1535
Christmas Lectures (Zoological Society of London), 1535
Christmas Lectures of the Royal Institution (Dr T E Allibone), 1613
Christophe, Jean, and others Increased Circulating Insulin-like Activity in Obese-Hyperglycaemic Mice, 61
Chromatic Responses Significance of the Time Relations of Humorally Co-ordinated (Dr A K Kent), 2027
Chromatin (Sex), in Cultured Human Tissues (Dr Charles P Miles), 477
Chromatin (Sex), ('Chromoleme'), in the Perkinje Nerve Cells of some Mammals (Nylceo Marques de Castro and Wilson da Silva Sasso), 293
Chromatin (Sex) Pattern in the Male Rat Effect of Sexual Maturation and Castration on the (St Zsifkovits, Ch Mehes and C Jobst), 1239
Chromatium Influence of Carotenoids on the Infra-Red Spectrum of Bacteriochlorophyll in (Dr J A Bergeron and Dr R C Fuller), 1340
Chromatograms (Paper) Autoradiography of Tritium-labelled Compounds on (Dr A W Rogers), 721
    Detection of 2-4-Dinitrophenyl Amino-Acids on (Dr A H Maddy), 1397
Chromatographic Columns (Packed and Capillary Gas) Comparison of Efficiency and Separating Power of (Dr J H Purnell), 2009
Chromatographic Fractionation of Rat Tail Tendon Collagen (Alexander Kessler, Hyman Rosen and Dr Stanley M Levenson), 1640
Chromatographic Identification of the Antilipaemic X Factor of the Unsaponifiable Fraction of Crude Vegetable Oils (Prof M C Nath, A Saikia and B I Uppin), 1635
Chromatographic Method (A Paper-), for the Determination of Suitable Buffer Systems for Countercurrent Distribution (Andrzej Waksmundzki and Edward Soczewinski), 977
Chromatographic Methods Separation of Polyvinyl Chloride and Polyvinyl Acetate by (W J Langford and D J Vaughan), 1116
Chromatographic Reviews—Progress in Chromatography, Electrophoresis and related Methods (edited by Michael Lederer), Vol I, *review* by Dr R Consden, 1436
Chromatographic Separation (Gas), of Long-chain Fatty Acid Methyl Esters on Polyvinyl Acetate (Irwin Hornstein, L E Elliott and P F Crowe), 1710
Chromatographic Separation (Paper), of Components of Rose Bengal Labelled with Iodine-131 (Fausto W Lima and Rômulo R Pieroni), 1065
Chromatographic and Biological Characteristics of Fish and Frog Neurohypophysial Extracts (Active Principles of the Neurohypophysis of Cold-blooded Vertebrates), (R T Pickering and Prof H Heller), 1463

Chromatographical Observations (Physical and), of γ-Irradiated Potato Starch Granules (Akira Mishina and Ziro Nikuni), 1867
Chromatographie Papier- (Dr Friedrich Cramer), vierte Auflage, *review* by Dr R Consden, 1436
Chromatographie (Papier-) Handbuch der (herausgegeben von Dr I M Hais und Dr K Macek), Band I, Grundlagen und Technik, *review* by Dr R Consden, 1436
Chromatography Comparative Effects of Heat on, and Ultra-violet Absorption of Deoxyribo- or Ribo-Nucleic Acids (Dr Saul Kit), 36
  'Eddy' Diffusion in (J Calvin Giddings), 357
  Gas (Gas Chromatography Discussion Group and the Hydrocarbon Research Group of the Institute of Petroleum Symposium on), 327
  Keeping Up to Date with, *review* by Dr R Consden, 1436
  Volatile Liquid Partition (Dr Roger S Porter and Dr Julian F Johnson), 978
Chromatography of Calcium Phosphate Purification of Herpes Simplex Virus by (Janice Taverne and Peter Wildy), 1655
Chromatography (Gas) Analysis of Permanent Gases by, using a Radioactive Ionization Type Detector (V Willis), 894
  Carrier Gas and Sensitivity in (E M Fredericks, M Dimbat and F H Stross), B A 54 , (Dr N H Ray), B A 54
  Progress in (C G Scott), 1199
  Sensitivity of Catharometers in, and the Thermal Conductivity of Binary Gas Mixtures (A B Littlewood), 1631
  Use of Coated Tubing as Columns for (Prof Albert Zlatkis and H R Kaufman), 2010
Chromatography (Gas Solid) Separation of the *Meta*- and *Para*-Isomers of the Xylenes, Cresols and Toluidines by (M A Hughes, D White and Prof A L Roberts), 1796
Chromatography (Glass-Paper) Specific and Sensitive Assay Method for Vasopressin and Oxytocin using (Akira Arimura and Prof Joseph F Dingman), 1874
Chromatography (Paper) Applications of, to Systematics—Recombination of Parental Biochemical Components in a *Baptisia* Hybrid Population (Dr R E Alston and Dr B L Turner), 285
Chromatography (Paper), of Cell Fragments (A T Wilson), 2016
Chromatography (Paper), of Corticosteroids at Room Temperature (J Tuzson), 1937
Chromatography (Paper), and Paper Electrophoresis A Manual of (Richard J Block, Emmett L Durrum and Gunter Zweig), second edition, *review* by Dr R Consden, 1436
Chromatography (Quantitative Paper), based on the Sub-Micro Titration of Derivatives containing Nitro Groups (L Blom and J Caris), 1313
Chromatography, Electrophoresis and related Methods Chromatographic Reviews—Progress in (edited by Michael Lederer), Vol I, *review* by Dr R Consden, 1436
Chromatography Columns (Gas–Liquid) Unexpected Formation of Volatile Compounds on (C Weurman and J Dhont), 1480
Chromium Distribution around Grain Boundary Carbides found in Austenitic Stainless Steel (B E Hopkinson and K G Carroll), 1479
Chromium Ribonucleoprotein from Bovine Liver (Dr W E C Wacker and Dr B L Vallee), 1399
Chromogenic Strain (A Non-Gummy), of *Azotobacter vinelandii* (J A Bush and Prof P W Wilson), 381
'Chromoleme' (Sex Chromatin), in the Purkinje Nerve Cells of some Animals (Nylceo Marques de Castro and Wilson da Silva Sasso), 293
Chromoprotein Pigments of some Cryptomonad Flagellates (Photoreactive Pigments in Flagellates), (Dr Mary Belle Allen, Dr Ellsworth C Dougherty and Dr John J A McLaughlin), 1047
Chromosomal Evolution in Eutherian Mammals (Prof Robert Matthey), 1329
Chromosomal Synthesis of Ribonucleic Acid as shown by Incorporation of Uridine labelled with Tritium (G Pelling), 655
Chromosome Breakage with Plant Pigments (Dr Arun Kumar Sharma and Arati Gupta), 1821
Chromosome Complement of Spontaneous Leukaemia in *AKR* Mice (H F Stich, R Wakonig and Dr A A Axelrad), 998
Chromosome Numbers in *Solidago* (J R Beaudry and D L Chabot), 236
40-Chromosome Variant in *Solanum nigrum* L (U K Rai), 1587
Chronic Morphine Administration (Acute and) Noradrenaline and Adrenaline in the Rat Brain during, and during Withdrawal (Dr Lars-M Gunne), 1950
Chronic Schizophrenia (Dr Thomas Freeman, John L Cameron and Andrew McGhie), *review* by Prof Martin Roth, 487
Chronowicz, A W Appointed lecturer in civil engineering at the University of Leeds, 684
Chum Salmon Two Haemoglobins in (K Hashimoto and Prof F Matsuura), 1418
Churches, Central Council for the Care of, and the Society for the Protection of Ancient Buildings Report on the Conservation of English Wallpaintings, 1119
Chvapil, Dr M , and Hurych, J Hydroxylation of Proline *in vitro*, 1145
Chymia—Annual Studies in the History of Chemistry, Vol 5 (edited by Henry M Leicester), *review* by Prof J R Partington, 1900
Chymotrypsin Reactivity and Inter-relationship of Intermediates in the Hydrolysis of *p*-Nitrophenyl Acetate Catalysed by (Mario A Marini and Prof George P Hess), 113
Ciba (A R L), Ltd New Research and Production Facilities at (R F Webb), 601
Ciba Foundation Ten Years Report for 1949-1959, 681
  Symposium on Medical Biology and Etruscan Origins (edited by G E W Wolstenholme and Cecilia M O'Connor), *review* by Madelaine Smith, 1348
Ciba Fellowships for 1960-61, 1613
Ciccarone, P , and others Biological Effects of Low Doses of Ionizing Radiations (An Effect which occurred soon after the Comparatively Low Dose of 150 r (whole-body) to Rats), 1112
Cinnamic Acid and Hydroxy-Cinnamic Acids Metabolism of, by *Lactobacillus pastorianus* var *quinicus* (Dr G C Whiting and Dr J G Carr), 1427
Circuits (Extracorporeal) Release of Adenosine Triphosphate and Serotonin from Injured Cellular Blood Elements in (Dr H S S Sarajas, Dr R Kristoffersson and Dr M H Frick), 1127
Circuits (Transistor) Use of the Silicon Resistor in the d c Stabilization of (J T Zakrzewski and D H Mehrtens), 811
Circulating Blood Cells Synthesis of Haem by (Peggy Clark and Dr R J Walsh), 1730
Circulating Ferritin Pathophysiological Effects of (Yoshio Oki), 1944
Circulating Insulin-like Activity in Obese-Hyperglycaemic Mice Increased (Jean Christophe, Yves Dagenais and Jean Mayer), 61
Circulation (Droplet), and Interfacial Disturbances in Gas—Liquid Systems (Dr C Ramshaw and Dr J D Thornton), 719
Circumpolar Arctic Flora (Dr Nicholas Polunin), *review* by R D Meikle, 1347
Citrate Agar (Simmons's) Production of Colicines in (Dr J Paravassiliou), 1339
Citrate-Dithionite Reagent (Neutral) Aluminium extracted by (W M H Saunders), 2037
Citric Acid Colorimetric Estimation of (Prof R E Macdonald and W E Waterbury), 988
Citric Acid Production by *Aspergillus niger* Effect of Sulphanilamide on (K V Rajagopalan, R Radhakrishnamurthy and P S Sarma), 461
Citrullus vulgaris (Water Melon) α-Amino-β-(pyrazolyl-N) Propionic Acid, a New Amino-Acid from (Dr F F Noe and Dr L Fowden), B A 69
Citrus Red Mite *Panonychus citri* (McG) A Suspected Virus Disease of the (Dr Kenneth M Smith, G J Hills, F Munger and J E Gilmore), 70
Citterio, Dr C (Mascitelli-Coriandoli, E and) Intracellular Thioctic Acid and Coenzyme A following Vanadium Treatment, 1641
City of London College, in collaboration with the Plastics Institute Lectures on Plastics, 508
City of Paris Medal Awards, B A 16
Civil Nuclear Power Research and Development Charges in, 406
Civil Service, Scientific Special Promotions, 858
Civil Service Commissioners Ninety-third Annual Report (1958-59), 1278
Clapham, Prof A R , and others Excursion Flora of the British Isles, *review* by P Falk, 1093
Claridge, R F C , and Maddock, Dr A G Annealing of Recoil Damage by Ultra-Violet Light, 1932
Clark, F Le Gros Age and the Working Lives of Men, 318
Clark, Dr J E , and Heath, Prof O V S Auxin and the Bulbing of Onions, 345
Clark, M L Awarded a Nature Conservancy Research Studentship for postgraduate training in ecology (zoology), 156
Clark, Peggy, and Walsh, Dr R J Synthesis of Haem by Circulating Blood Cells, 1730
Clark, Dr W C (Latty, James E , and) Forces between Titanium Dioxide Pigment Particles, 49
Clark-Lewis, Dr J W , and Mortimer, P I Occurrence of 4-Hydroxypipecolic Acid in *Acacia* Species, 1234
Clarke Dr Donald A , and others Effect of Bacillus Calmette-Guerin Infection on Transplanted Tumours in the Mouse, 291
Clarke, Prof E , and Turner, A *Obituary* of Prof G O Sherrard, 1531
Clarke, Dr E G C Identification of Phenazocine, a Potent New Analgesic, 451
Clarke, Dr F J P Special Ceramics (Properties of certain Oxide Crystals —Room-temperature Ductility of Single Crystals of Magnesium Oxide), 1115
Clarke, G , and others Occurrence of 3-Indolylacetic and 3-Indolecarboxylic Acids in Tomato Crown-Gall Tissue Extracts, 825
Clarke, J W , and McTurk, G Some Experiments in Rice's Blue Material, 2014
Class (Social) The Psychology of (Maurice Halbwachs), translated by Claire Delavenay, *review* by Prof T S Simey, 754
Classes (Different Size), in Non-diabetic Humans of Varying Ages Actual Distribution of the Number and Volume of the Islets of Langerhans in (Bo Hellman), 1498
Classical Analysis Linear Operations and, *review* by Prof L S Goddard, 1763
Classical Chemical Analysis, *review* by Dr William I Stephen 1756
Classical Optics Concepts of (Dr John Strong), *review* by Dr J E Geake, 130
Classics of Nutrition, *review* by Dr Leslie J Harris, 484
Classification of Elements Periodic (A A Clifford), 2012
Classification (A Revised), of the Ludlovian Succession at Ludlow (C H Holland, J D Lawson and V G Walmsley), 1037
Classification, Concept-formation and Language (British Society for the Philosophy of Science Symposium on), 1193
Claxton, J H , and others Growth Responses to Selenium in Lambs, 251
Clay, Dr Theresa Evolution of Host–Parasite Relationships (Evolution of Host–Parasite Relationships in the Mallophaga of Birds), 762
Clay Minerals (Clay Minerals Group of the Mineralogical Society Discussion on), 779
Clay Minerals (X-Ray Analysis Group of the Institute of Physics Discussion on), 780
Clay Products Permanent Moisture Expansion of, on Natural Exposure (J S Hosking and H V Hueber), 1373
Clays of Japan Mineralogical Study on (Dr Toshio Sudo), *review* by Dr D M C MacEwan, 1439
Clays (Activated Charcoal and) Insecticidal Effects of (S K Majumder, K S Narasimhan and V Subrahmanyan), 1165
Clays (Straining) Swelling Forces in (E L Greacen), 1695
Clayton, R B A Simplified Method for the Culture of *Blatella germanica* under Aseptic Conditions, 1166
Clayton, Dr Y M , and others Human Precipitins against Common Pathogenic and Non-Pathogenic Fungi, 1328
Cleavage (Early), of the Zebra Fish Variations in (A W Marrable), 1160
Cleavage (Side-Chain), during the Reaction of Epinephrine and Norepinephrine with Ethylene Diamine Evidence of (Dr Louis-P Joly and Dr Guy Nadeau), 1483
Cleave, Dr J P At the Annual General Meeting and Conference of the Mathematical Association (Translation of Languages by Machine), 33
Cleghorn, T E A 'New' Human Blood Group Antigen, Sw_a, 1324
Clein, L J Appointed lecturer in mental health at Queen's University, Belfast, 1613
Clements Dr A N Appointed lecturer in physiology and biochemistry at the University of Southampton, 595
Clerical Salaries Analysis 1958 (Office Management Association), 698
Clezy, Dr P S Reaction of Formyl Porphyrins with Acetone-Hydrochloric Acid, 1142

Clezy, Dr P S (Barrett, J , and) Selective Oxidation of Tetrapyrrole Side-Chains, 1988
Clifford, A A Periodic Classification of Elements, 2012
Clifford, H T Vivipary in *Eleusine indica* (L) Gaertn , 1888
Climate of the Atlantic–European Area and Secular Solar Activity Changes in the (Z Gregor and L Křivsky), 682
Climatic Significance (Pleistocene), of Calcretes and Ferricretes (Dr R J Mason, A B A Brink and K Knight) 568
Clinical Biochemical Method (Dr A L Tarnoky), *review* by Dr D S H W Nicol, 576
Clinical Biochemists, Association of Election of Officers, 857
Clinical Metabolic Research Enzymic Activities of Human Skeletal Muscle Mitochondria—a Tool in (Dr L Ernster, Dr D Ikkos and Dr R Luft), 1851
Clock (A Biological), in *Neurospora* (Growth Patterns in *Neurospora*), (C S Pittendrigh, Dr V G Bruce, N S Rosensweig and M L Rubin), 169
Clocks Animal (British Association for the Advancement of Science, Section D (Zoology), Symposium on), 763, 1534
Clocks (Non-linear) Stochastic Rectification of (David G Kendall), 1476
Clonal Selection Theory of Acquired Immunity (Sir Macfarlane Burnet), *review* by Dr J H Humphrey, 753
Clones (Virulent), of *Fusarium oxysporum* f *cubense* A Rapid and Simple Pathogenicity Test for Detecting, using Seedlings of *Musa balbisiara* (Dr R H Stover), 1591
Cloning Cells of Higher Plants A New Technique for Isolating and (Ludwig Bergmann), 648
Clothes Moth, *Tineola bisselliella* (Humm) A Reduced Triphosphopyridine Nucleotide-linked Cystine Reductase in the (R F Powning and H Irzykiewicz), 1230
Clothing The Chemistry of (British Association for the Advancement of Science, Section B (Chemistry), Symposium on), 849
Clots (Human Standard) Urokinase-Induced Fibrinolysis of (Dr Kuro N von Kaulla), 1320
Clouds (Noctilucent) Polarization of Light from (Georg Witt), 1618
Clouds (Solar Corpuscular) Apparent Observation of, by Direct Continuous-Wave Reflexion (Dr John D Klaus and W Reed Crone), 965
Cloudsley-Thompson, Dr J L Animal Clocks, 763, 1534
Clover Effect of *Rhizobium* Polysaccharide on the Formation of Polygalacturonase in Lucerne and (H Ljunggren and G Fahraeus), 1578
Clover Sickness Dagger Nematodes associated with a (F C Peacock), 123
Clover (Red), *Trifolium pratense* L Floral Initiation and its Relationship to Growth-Stage in (J L Stoddart), 559
Clover-free Diet Implications of Restricting Cows to a, in order to Reduce the Strontium Content of Milk (Dr David Purves), 1408
Clover Cyst Nematode *Heterodera trifolii* Goffart, 1932 Giant Eggs of the (Roland H Mulvey), 1662
Clowes, F A L Reorganization of Root Apices after Irradiation, 1025
Clunies-Ross, Sir Ian *Obituary* by Dr F W G White and D A Gill, 230
Clusters (Globular) A Search for Neutral Atomic Hydrogen in (Dr Morton S Roberts), 1555
Cnidian Medicine Ancient Egyptian and (Robert O Steuer and J B de C M Saunders), *review* by Dr Douglas Guthrie, 662
Coagulase Influence of on the Growth of Staphylococci in Normal Human Serum (Dr K Wlodarczek and Dr J Jeljaszewicz), 1514
Coagulase (Staphyloccal-free) Activation of, by Purified Human Prothrombin (G Haughton and E S Duthie), 116
Coagulating System (Blood), and the Physiological Anticoagulating System Interrelations between the (Prof P A Kudrjashov), 454
Coal Studies of (Staff of the British Coal Utilisation Research Association) —Carbonization of Coals in the Presence of Activated Charcoal (R L Bond, A M Godridge, A R Murnaghan, D H Napier and D J Williams), 425 , Smoke Emission from Coal and Low-Temperature Chars (D Finch), 426
Coal and Coal Extracts Biological Properties of (Dr A A Mills), 1885
Coal Board, National Grant of £4,310 to the University of Leeds, for six research projects in mining, 1534
  Grant of £1,150 to the Department of Physical and Inorganic Chemistry in the University of Bristol, for a study of carbon surfaces and surface complexes by infra-red spectroscopy, and £1,100 for a study of reactivity of carbon surfaces with oxygen, 1613
Coal Board, National (North-Eastern Division) Grant of £3,000 to the University of Leeds, for research in mining, 1108
Coal Extracts Biological Properties of Coal and (Dr A A Mills), 1885
Coal Preparation Second Symposium on (Department of Mining, University of Leeds, 1957), *review* by Prof S G Ward, 1601
Coal Science Third Biennial International Conference on 412
Coal Utilization Research Association, British (Staff of the) Studies of Coal—Carbonization of Coals in the Presence of Activated Charcoal (R L Bond, A M Godridge, A R Murnaghan, D H Napier and D J Williams), 425 , Smoke Emission from Coal and Low-Temperature Chars (D Finch), 426
Coal during Carbonization at Different Heating Rates Number of Free Radicals in (J Smidt and Prof D W van Krevelen), 719
Coal and Low-Temperature Chars Smoke Emission from (Studies of Coal), (D Finch), 426
Coals Carbonization of in the Presence of Activated Charcoal (Studies of Coal), (R L Bond, A M Godridge, A R Murnaghan, D H Napier and D J Williams), 425
Coals (Bituminous) Structure of—Evidence from Distribution of Hydrogen (Dr P H Given), 980
Coast Erosion and Accretion (British Association for the Advancement of Science, Sections E (Geography) and K (Botany), Discussion on), 499
Coast and Geodetic Survey, United States To erect a Geodetic Marker at the South Pole, 1612
Coastal Waters of Japan (1959) Concentration of Caesium-137 in the (Noboru Yamagata), 1813
Coat-Shedding in a Tropical Breed of Hair Sheep Light Regulation of (R B Symington), 1076
Coated Tubing as Columns for Gas Chromatography Use of (Prof Albert Zlatkis and H R Kaufman), 2010
Coates, Colonel John Boyd (editor-in-chief) Surgery in World War II, Neuro-surgery, Vol 1, *review* by J E A O'Connell, 1676
Coating of Red Blood Cells with Antigenic Substances (Dr K Deutsch), 278
Cobalt-60 and Caesium-137 Translocation of, by Fungi in Agar and Soil Cultures (Dr Erna Grossbard and Dr D R Stranks), 310
Cobalt Acetate Tetrahydrate Temperature Variation of the Principal Magnetic Moments of Co^{++} Ions and the Asymmetry of the Crystalline Electric Field in (Dr Bhagawati Charan Guha), 50
Co^{++} Ions Temperature Variation of the Principal Magnetic Moments of, and the Asymmetry of the Crystalline Electric Field in Cobalt Acetate Tetrahydrate (Dr Bhagawati Charan Guha), 50
Cobaltic Oxide Pellets Effect of, on the Vitamin B_{12} Content of Ewes' Milk (L I Hart and E D Andrews), 1242
Cobb, James C , and others The Geological Time-Scale, B A 62
Cocconi, Giuseppe, and Morrison, Philip Searching for Interstellar Communications, 844
Cochrane, Prof Vincent W Physiology of Fungi, *review* by Dr J L Harley, 85
Cockburn, Dr R Appointed chief scientist of the Ministry of Supply, 938 , work of, 938
Cocoa (*Theobroma cacao* L), in Ghana New Pests of, following Applications of Insecticides (P F Entwistle, C G Johnson and E Dunn), 2040
Coconut Palm The (Dr K P V Menon and Dr K M Pandalai), *review* by Prof C W Wardlaw, 1760
Coconut Seedlings Albinism in (Dr K M Pandalai and R V Pillai), 1163
Coconuts, *review* by Prof C W Wardlaw, 1760
Co-dehydrogenases (Apo- and) Interaction of Streptomycin and Dihydrostreptomycin with (Prof K Michalska), 987
Codner, R C , and Platt, B C Light-induced Production of Carotenoid Pigments by *Cephalosporia*, 741, *erratum*, 1108
Coefficients (Rotational Friction), of Models of Tobacco Mosaic Virus and the Size of the Virus Particle (Dr A J Haltner and Dr B H Zimm), 265
Co-enzyme Rôle of the, in the Stabilization of Glyceraldehyde-3-phosphate Dehydrogenase (P Elodi and G Szabolcsi), 56
Coenzyme A Intracellular Thioctic Acid and, following Vanadium Treatment (E Mascitelli-Coriandoli and Dr C Citterio), 1641
Coenzyme Q (Dr T Ramasarma), 1368
Coenzyme for Histidine Decarboxylase Pyridoxal Phosphate, a (S Ono and Prof P Hagen), 1143
Coetzee, Prof J N , and Sacks, T G Lysogeny in the Genus *Proteus*, 1340
Coffea Recherches sur les Affinités Chromosomiques dans le Genre (J Bouharmont), 518
Coffea canephora Pierre Recherches sur l'Autostérilité du Caféier robusta (M Devreux, G Vallaeys, P Pochet et A Gilles), 518
Cohen, I Bernard (edited with a General Introduction by, assisted by Robert E Schofield) Isaac Newton's Papers and Letters on Natural Philosophy and related Documents, *review* by Dr M A Hoskin, 1570
Cohen, Prof John Chance and Probability (The Psychology of Luck), 498
Cohen, Dr J Appointed a lecturer in zoology at the University of Birmingham, 684, 1362
Cohen, M , and others Atomic Mechanisms of Fracture (Tensile Fracture of Mild Steels), 325
Coil Spring Federation Research Organization New Laboratories of the, 777
Coinage Metals (Cu, Ag, Au) Electron Spin Resonance and Divalency of some Dithiocarbamates of the (Tore Vänngard and Stig Åkerstrom), 183
Coins (Partially Distinguishable) Heads-Tails Statistics for Two (Gabriel Weinreich), 1825
Coke in Ironmaking Successful Use of (Meeting of the Iron and Steel Institute at the University of Birmingham and at Coalbrookdale to celebrate the 250th anniversary of the), 322
Coke Oven Managers' Association, the Institution of Gas Engineers and the British Coke Research Association Joint Meeting, 1778
Coke Research in Great Britain Progress in, 1778
Coke Research Association, British (Coke Oven Managers' Association, the Institution of Gas Engineers and the) Joint Meeting, 1778
Colaba and Alibag Observatories Retirement of S L Malurkar from the directorship, 1611
Cold World The Very, *review* by Prof J F Allen, 1260
Cold-blooded Vertebrates Active Principles of the Neurohypophysis of—Chromatographic and Biological Characteristics of Fish and Frog Neurohypophysial Extracts (B T Pickering and Prof H Heller), 1463 , Pharmacological Evidence for the Presence of Arginine Vasotocin and Oxytocin in Neurohypophysial Extracts from Cold-blooded Vertebrates (Wilbur H Sawyer, Robert A Munsick and Prof H B van Dyke), 1464 , Arginine Vasotocin (Panayotis G Katsoyannis and Prof Vincent du Vigneaud), 1465
  Pharmacological Evidence for the Presence of Arginine Vasotocin and Oxytocin in Neurohypophysial Extracts from (Active Principles of the Neurohypophysis of Cold-blooded Vertebrates), (Wilbur H Sawyer, Robert A Munsick and Prof H B van Dyke), 1464
Cole, Dr A R H , and Muller, G T A At the Second Australian Spectroscopy Conference (Stable Conformations of a Series of Methyl-*cyclo*-hexanols), 1196
Cole, G Coast Erosion and Accretion (Gathering and Stabilizing of Sands, Silts and Clays by Vegetation), 500
Cole, H H , and Cupps, P T (edited by) Reproduction in Domestic Animals, Vol 1, *review* by Dr S J Folley, 1091
Cole, L J Biological Effects of Low Doses of Ionizing Radiations (Effects of Single Exposures and 'Chronic' or Fractionated Radiation), 1113
Cole, L J , and Garver, R M Abrogation by Injected Mouse Blood of Protective Effect of Foreign Bone Marrow in Lethally X-Irradiated Mice, 1815
Cole, Dr M , and Borucka, Dr A Z Special Ceramics (Novel Replaceable Heating Element), 1116
Cole, W F , and Kroone, B Carbonate Minerals in Hydrated Portland Cement, B A 57
Coleman, G , and Elliot, W H Structure and Chemistry of Proteins (Synthesis of α-Amylase by *Bacillus subtilis*), 1277
Coleman, I , and Beveridge, J M R Effect of Dietary Fat and Extent of Blood Sampling on the Level of Plasma Cholesterol in the Rat, 1039
Coléoptères Curculionides (Faune de France, Vol 62), (Adolphe Hoffmann), troisiéme partie, *review* by R T Thompson, 573
Coleoptile Cell Walls (Maize) A Partial Chemical Characterization of, prepared with the Aid of a Continually Renewable Filter (Prof Aleksander Kivilaan, Teofila C Beaman and Robert S Bandurski), B A 81
Coles, D R Appointed lecturer in medicine at the University of Bristol, 322

Coles, Surg Lieut R R A, and Knight, J J Effect of Jet Aircraft Noise on Hearing, 1803
Colgate, Dr S A The Thermonuclear Processes (Hydrodynamic Stability Studies using High Current Pulses through Sodium), 241
  Ionization Phenomena in Gases (Linear and Toroidal Hard-core or Inverse Pinch), 1357
Colicine Production of, by Single Bacteria (H Ozeki, Dr B A D Stocker and Helène de Margerie), 337
Colicines in Simmons's Citrate Agar Production of (Dr J Papavassiliou), 1339
Colin, L (Weisbrod, S, and) Refraction of Very High Frequency Radio Signals at Ionospheric Heights, 119
Collagen The Optical Rotatory Power of (Dr R E Burge and R D Hynes), 1562
Collagen (Rat Tail Tendon) Chromatographic Fractionation of (Alexander Kessler, Hyman Rosen and Dr Stanley M Levenson), 1640
Colldahl, Helge, and others A New Method for Studying the Functioning of the Lungs, 372
College of Physicians of Philadelphia Alvarenga Prize for 1959 awarded to Dr Hilary Koprowski, 683
Colleges (Technical) Relationship between Industry and (Liverpool District of the Federation of British Industries Conference on), 1690
Colli, Walter (Raw, Dr Isaias, and) Crystalline Cytochrome b_5, 1798
Collinge, Dr B Appointed reader in physics in the University of Liverpool, 410
Collins, Prof H J Title of professor emeritus of civil engineering in the University of London conferred on, 508
Collision Broadening of Spectral Lines, 155
Collision Effects in Atomic Spectra (W R Hindmarsh), 155
Collisions (Automobile) Experiments on (Prof J H Mathewson), 237
Collison, Dr R, and Elton, Dr G A H Gelation (The Swelling of Starch), 863
Collocalia Echo-location among (Lord Medway), 1352
Colloid-storing Function of Histiocytes A Method for *in vitro* Investigation of the (Prof N Jancso, Aurelia Jancso-Gabor and J Balassy), 1070
Colman, J S (Nagabhushanam, A K, and) Carrion-Eating by Ophiuroids, 285
Colomina, M Thermodynamics (Experimental Thermochemistry), 1607
Colonial Development Corporation Annual Report for 1958, 680
  Report of the Committee of Enquiry into the Financial Structure of the, 1520
Colonial Medical Research Council Grant of £2,500 for two years to the University of Oxford, for the study of the sensory neurohistological changes in skin infected with leprosy, 1362
Colonial Office The Colonial Territories, 1958-1959, 1541
Colonial Territories, 1958-1959 (Colonial Office), 1541
Colorado Potato Beetle, *Leptinotarsa decemlineata* (Say) Common Attractant for the Tobacco Hornworm, *Protoparce sexta* (Johan) and the (Dr Robert T Yamamoto and Prof G Fraenkel), 206
Colorado State University Proceedings of the Third Symposium on Reproduction and Infertility (edited by F X Gassner, in association with Rue Jensen and H J Hill), *review* by Dr T Mann, 1434
Colored Lights (White and), and Darkness Behavior and Reactions of the Pacific Sardine, *Sardinops caerulea* (Girard), under the Influence of (Dr A S Loukashkin and Dr N Grant), 865
Colorimetric Determination of Elastin Some Improvements in (Dr V Scarselli), 1563
Colorimetric Estimation of Citric Acid (Prof R E Macdonald and W E Waterbury), 988
Colorimetric Methods of Analysis, including Photometric Methods (Dr Foster Dee Snell and Dr Cornelia T Snell, assisted by Dr Chester Arthur Snell), Vol 2A, *review* by J King, 1522
Colorimetry, *review* by J King, 1522
Colour The Reproduction of (Dr R W. G Hunt), *review* by Dr W S Stiles, 1092
Colour of the Iris of the Eye Association between, and Reaction to Dental Pain (Dr Philip R N Sutton), 122
Colour Centres produced by Radiation in Silica Gel (Harold W Kohn), 630, *erratum*, 1026
Colour-Image Synthesis with Two Unorthodox Primaries (Arthur Karp), 710
Colour Photography Kodak Scholarships in, 1915
Colour Photography of the Aurora (B P Sandford and P Heiser), 540
Colour Reactions of certain Phenols with Ehrlich's Reagent (Dr Cornelius Steelink), 720
Colour Reproduction, *review* by Dr W S Stiles, 1092
Colour Television (G G Gouriet), 1535
Colourability of Substituted Human Serum Proteins Modifications in Immunological Behaviour, Electrophoretic Mobility and (M Steinbuch, Dr J M Fine and A Battistini), 1571
Coloured Product of the Sakaguchi Reaction (Kshirod R Bhattacharya), 53
Colston Research Society Proceedings of the Tenth Symposium on the Structure and Properties of Porous Materials, held in the University of Bristol, 1958 (edited by D H Everett and F S Stone), *review*, 1525
Colter, Dr John S The Structure of Science (Viral Nucleic Acids), B A 9
Colter, Dr John S, and others Ribonucleases of Mouse Tissues and of the Ehrlich Ascites Tumour, 984
Columns for Gas Chromatography Use of Coated Tubing as (Prof Albert Zlatkis and H R Kaufman), 2010
Comar, Dr Cyril L Appointed associate editor of the *Journal of Nutrition*, 156
Comber, Dr R Effect on the Groundnut of Variations in Supply of Potassium, Calcium and Magnesium, 1003
Combined Effects of Cortisone and Insulin on Developing Chicken Embryos (Dr Pietro de Franciscis and Prof Walter Landauer), 101
Combined Use of Polymyxin and Acetone to obtain Cell-free Enzymes (J R Villanueva), 1565
Combustion Report of the seventh International Symposium on, 770
  A Method for Determining Carbon-14 by, using Calcium Carbonate (E C S Little), 900
Comet, Stig Awarded a Silver Medal of the City of Paris, B A 16
Comitato Nazionale per le Ricerche Nucleari, and others Symposium on the Biological Effects of Low Doses of Ionizing Radiations, 1111
Commerce Staff in Industry and—Management of Workers whose Skills are mainly Mental or Social rather than Manual (E. M Barling), 319
Commerce, Tyneside Association of Libraries for Industry and, 25
Commercial Control Two Threats to Broadcasting—Political and (H Carleton Greene), 661
Common Attractant for the Tobacco Horn-worm, *Protoparce sexta* (Johan) and the Colorado Potato Beetle, *Leptinotarsa decemlineata* (Say), (Dr Robert T Yamamoto and Prof G Fraenkel), 206
Common Laboratory Mammals Visual Pigments of some (Dr C D B Bridges), 1727
Common Pathogenic and Non-Pathogenic Fungi Human Precipitins against (Dr J Pepys, Dr R W Riddell and Dr Y M Clayton), 1328
'Common Strontium' (Anomalous), in Granite (W Compston and Dr P M Jeffery), 1792
Commoner, Prof Barry Replication of Tobacco Mosaic Virus—a Re-examination of Theories, 1998
Commoner, Prof Barry, and others Replication of Tobacco Mosaic Virus—Kinetics of Virus Protein and Ribonucleic Acid Biosynthesis, 1992
Commons, House of Third reading of the Nuclear Installations (Licensing and Insurance) Bill, 680
Commonwealth Educational Problems of the, 747
  University Co operation in the (Home Universities Conference 1959), 1613
Commonwealth, Universities of the Report of Proceedings of the Eighth Congress, Montreal, 1958, 1431
Commonwealth Agricultural Bureaux Appointment of A Perera as chairman of the Executive Council, 943
Commonwealth Education—the United Kingdom Contribution (Duncan Crow), 592
Commonwealth Education Liaison Committee (British) Establishment of a, 1361
Commonwealth Fund Harkness Fellowships for 1960, 857
Commonwealth Institute New building for the, 234
Commonwealth Scientific and Industrial Research Organization (Australian) Grant of 30,000 dollars from the Rockefeller Foundation, for special equipment for the new Division of Tropical Pastures, 93
  Grant of 100,000 dollars from the Rockefeller Foundation, for the Divisions of Plant Industry and of Entomology, 93
  Grant of 250,000 dollars from the Rockefeller Foundation, towards the cost of the radio telescope for the Division of Radiophysics, 93
  Formation of a Division of Mineral Chemistry, 237
  Appointment of Dr F W G White as chairman, 317
  Appointment of Dr R N Robertson as a full-time member of the Executive, 317
  Rural Research in C S I R O, 27, Fencing Posts in Australia, 320
  List of Divisions and Sections, 410
  Tenth Annual Report (1957-58), 1027
  Second Australian Spectroscopy Conference, 1195
  Symposium on the Structure and Chemistry of Proteins, 1276
  Retirement of D A Gill as chief of the Division of Animal Health and Production, 1532
  Appointment of Dr J M Rendel as chief of the Division of Animal Genetics, 1532
  Appointment of Dr T S Gregory as chief of the Division of Animal Health, 1532
  Appointment of Dr I W McDonald as chief of the Division of Animal Physiology, 1532
  Cunningham Laboratory of the, 1776
  Appointment of C S Christian and Prof L G H Huxley as members of the Executive, 1984
  Appointment of G B Gresford as secretary, 1985
  Appointment of W Ives as executive officer, 1985
Commonwealth Universities Yearbook, 1959 (Association of Universities of the British Commonwealth), *review*, 577
Commonwealth (British), Association of Universities of the Commonwealth Universities Yearbook, 1959, *review*, 577
Communication (Efficient), of Skills New Developments in Training—Five Studies in the (edited by Frank A Heller), 421
Communication Networks Synthesis of Linear (Wilhelm Cauer), second edition edited by Wilhelm Klein and Franz M Pelz (translated from the German by G E Knausenberger), *review*, 1525
Communication and Scientific Developments Mass Media of, 659
Communications The Critical Importance of Transport and (Sir Ewart Smith), B A 44
Communications (Interstellar) Searching for (Giuseppe Cocconi and Philip Morrison), 844
Compact Bone Distribution of Sodium in, as revealed by Autoradiography of Neutron-activated Sections (Prof J Vincent), 1332
Compaction of Briquettes (H R Gregory, D C Rhys Jones and J W Phillips), 120
Comparative Data (Tabular), for the Low- and High-Temperature Strains of *Chlorella* (Dr Constantine Sorokin), 613
Comparative Effects of Heat on Chromatography and Ultra-violet Absorption of Deoxyribo- or Ribo-Nucleic Acids (Dr Saul Kit), 36
Comparative Histology Textbook of (Dr Warren Andrew), *review* by Dr T Kerr, 752
Comparative Morphology of Vascular Plants (Adriance S Foster and Ernest M Gifford, Jr), *review* by Dr S Williams, 84
Comparative Morphological and Chemical Observation Phylogeny of the Genus *Aniba* Aubl —a (Walter B Mors, Otto Richard Gottlieb and Ida de Vattimo), 1589
Comparative Studies in Ultrastructure (Linnean Society of London Symposium on), 1445
Comparison of the Charges of the Electron, Proton and Neutron (A M Hillas and T E Cranshaw), 892 , (Prof H Bondi and Dr R A Lyttleton), 974
Comparison of Efficiency and Separating Power of Packed and Capillary Gas Chromatographic Columns (Dr J H Purnell), 2009
Comparison of Slime from Tomato and Banana Strains of *Pseudomonas solanacearum* (Dr W F Dudman), 1969
Compensation (Isostatic), and Mohorovičic Discontinuity, etc Depth of, in Continental and Oceanic Areas (J N Nanda), 629
Complement Release of Compounds containing Diaminopimelic Acid from *Vibrio metchnikovi* treated with Antibody and (Dr F Shafa and Dr M R J Salton), 1341
Complement (Chromosome), of Spontaneous Leukaemia in AKR Mice (H F Stich, R Wakonig and Dr A A Axelrad), 998

Complementation among the Sub-Genic Mutants in the *r*-Locus of *Drosophila melanogaster* (Dr O G Fahmy and Dr Myrtle J Fahmy), 1927
Complex (Enzyme-Substrate) Proof of the Formation of, by 'Crossing-Paper Electrophoresis' (Prof S Nakamura, K Takeo, I Sasaki and M Murata), 638
Complex (*Leiocephalus cubensis*), in Cuba and the Isla de Pinos Variation in Lizards of the (Albert Schwartz), 1107
Complex' ('Surface Membrane) Dissociation of the, in Atrophic Muscle Fibres (Dr R Birks, Prof B Katz and Dr R Miledi), 1507
Complex Carbohydrates Medical Aspects of (Prof M Stacey), B A 42
Complex Characters Heterosis and the Genetics of (Watkin Williams), 527
Complex Formation of Chlorpromazine with Flavins (Dr Kunio Yagi, Takayuki Ozawa and Toshiharu Nagatsu), 982
Complex Reaction in *Hyoscyamus niger* upon Night Interruption with Red Light (P J A L de Lint), 731
Complexes Histidine–Copper (II), (Dr D D Perrin), 1868
Complexes (α-Hydroxyacetylene), of Platinum (II) Structure of (Dr J Chatt, L A Duncanson and R G Guy), 526
Complexes (Metal), of Oxine and its Sulphonic Acid Stability of (Prof Adrien Albert and Prof Reino Nasanen), 449
Complexes (Montmorillonite) Birefringence of (R Greene-Kelly), 181
Complexes (Polynuclear), of Molybdenum (II), (Dr J C Sheldon), 1210
Complexing with Anionic Derivatives of Synthetic Polyglucoses Reduction of Toxicity of Cationic Macromolecules by (P T Mora, B G Young and M J Shear), 431
Components of Folic Acid Reductases Flavins as (Dr Beatriz M Braganca and U W Kenkare), 1488
Components of Rose Bengal Labelled with Iodine-131 Paper Chromatographic Separation of (Fausto W Lima and Rômulo R Pieroni), 1065
Components (Antigenic), from Isolated Nuclei Transplantation Immunity —Separation of (Andre Castermans and Andre Oth), 1224
Components (Macromolecular), of *Chlorella pyrenoidosa* (Philip Newmark, Jack D Stephens, James B Curry and Gail L Bower), 963
Components (Parental Biochemical), in a *Baptisia* Hybrid Population Applications of Paper Chromatography to Systematics—Recombination of (Dr R E Alston and Dr B L Turner), 285
Composition with an Electronic Computer Experimental Music— (Prof L A Hiller, Jr, and Leonard M Isaacson), *review* by Prof E G Richardson, 1754
Composition of some Fat-free Carcasses and Bodies of New Zealand Sheep (A H Kirton, M J Ulyatt and R A Barton), 1724
Composition of the Haemolymph of *Petrobius maritimus* Leach (Dr A P M Lockwood and Dr P C Croghan), 370
Composition of a Paraffin Wax Fraction from Tobacco Leaf and Tobacco Smoke (Dr W Carruthers and Dr R A W Johnstone), 1131
Composition of Sieve-Tube Sap (A J Peel and Dr P E Weatherley), 1955
Composition of Teichoic Acids from a Number of Bacterial Walls (Teichoic Acids from Bacterial Walls), (J J Armstrong, Prof J Baddiley, Dr J G Buchanan, A L Davison, M V Kelemen and F C Neuhaus), 247
Composition (Isotopic), of Boron (D C Newton, A C Tyrrell and J Sanders), 185
Composition (Spectral), of the Luminescence of the Euphausiid *Thysanoessa raschii* (Dr Brian P Boden and Dr Elizabeth M Kampa), 1321
Compound from *Olea europaea* Oleuropeic Acid, a New (Baruch Shasha and Prof Jeshaia Leibowitz), 2019
Compound (A Cardiolipin-like), in Rat Liver Mitochondria (G S Getz and W Bartley), 1229
Compound (A New Carbonyl), from *Piper methysticum* Forst (Prof Paul J Scheuer and Thomas J Horigan), 979
Compounds Effect of Steroids and related, on the Growth of Dermatophytes (Dr F W Chattaway, J D Townsley and A J E Barlow), 1731
  Heterocyclic (edited by Dr E H Rodd), (Chemistry of Carbon Compounds, Vol 4, Part B), *review* by Dr F G Mann, 1758
  High-Voltage Paper Electrophoresis of Aliphatic Amines and related (Dr D Gross), 1633
  New Antiadrenergic (A L A Boura, F C Copp and A F Green), B A 70
  Organic-Phosphorus (Bradford Institute of Technology Symposium on), 1688
  Phosphorus and its (John R Van Wazer), Vol I, Chemistry, *review* by Dr F G Mann, 389
  Six-Membered Heterocyclic Nitrogen, with Three Condensed Rings (C F H Allen, in collaboration with G M Badger, Brice Graham, G A Reynolds, James H Richmond, John R Thirtle, J A Van Allen and C V Wilson), *review* by Dr F G Mann, 216
  Stoichiometry of Bismuth Telluride and related (G Offergeld and J van Cakenberghe), 185
Compounds High Molecular (published in the Russian language by the Academy of Sciences of the U S S R), 410
Compounds containing Diaminopimelic Acid Release of, from *Vibrio metchnikovi* treated with Antibody and Complement (Dr F Shafa and Dr M R J Salton), 1341
Compounds (Aliphatic Carbonyl) A Correlation between the Shift in the Ultra-Violet Absorption Maxima and the Electronegativity of the Adjacent Atoms in some (Dr P Borrell), 1932
Compounds (Aromatic) Hydrogenolysis of Carbon-Oxygen Bonds in some, by Electrolysis (Dr P H Given and Dr M E Peover), 1064
Compounds (Carbon) Chemistry of (edited by Dr E H Rodd), Vol 4, Part B, Heterocyclic Compounds, *review* by Dr F G Mann, 1758
Compounds (Cyanocarbon Organic) Histochemical Use of the (Prof. John F Lhotka), 1153
Compounds (Ferrichrome) The Iron-Binding Centre of (Dr T Emery and Dr J B Neilands), 1632
Compounds (Foreign) Stimulatory Effect of, on Ascorbic Acid Biosynthesis and on Drug-Metabolizing Enzymes (Dr A H Conney and Dr J J Burns), 363
Compounds (Heterocyclic) The Chemistry of, Vol 13, *s*-Triazines and Derivatives (edited by Edwin M Smolin and Lorence Rapoport), *review* by Dr F G Mann, 1758
Compounds (Insoluble Protein-Tannin) Regeneration of Protein from (Dr W Mejbaum-Katzenellenbogen, W Dobryszycka, J Boguslawska-Jaworska and B Morawiecka), 1799
Compounds (Nucleotide–Peptide), of *Saccharomyces cerevisiae* (G Harris and J W Davies), 788
Compounds (Onium), in Brain Tissue Presence of certain, following Intravenous Administration to Rats (Prof Ruth R Levine), 1412
Compounds (Organic) Nitration of Hydrocarbons and other (A V Topchiev) translated from the Russian by Catherine Matthews, *review* by Prof M J S Dewar, 577
  Oxidation of (Symposium on, at Queen Mary College, London), 326
  Some Remarks on the Thermodynamic Properties of (Prof George S Parks), 1194
Compounds (Organic), in the Blood Post-Exposure Analysis of, by a Rapid Infra-red Technique (Dr R D Stewart, D S Erley, T R Torkelson and C L Hake), 192
Compounds (Organic), labelled with Isotopes of the Halogens, Hydrogen, Nitrogen, Oxygen, Phosphorus and Sulfur (Arthur Murray, III, and D Lloyd Williams), (Organic Syntheses with Isotopes, Part 2), *review* by Dr G Eglinton, 1830
Compounds (Quantitative Assay of), in Isolated, Fresh Nerve Cells and Glial Cells from Control and Stimulated Animals (Prof Holger Hyden), 433
Compounds (Substituted Phenoxy-), and other Translocated Herbicides Effects of, on the Rhizome of Bracken (Dr Elsie Conway and J A Forrest), 1416
Compounds (Tritium-labelled) Autoradiography of, on Paper Chromatograms (Dr A W Rogers) 721
Compounds (Volatile), on Gas–Liquid Chromatography Columns Unexpected Formation of (C Weurman and J Dhont), 1480
Comprehension of Scientific Journals Effects of Printing Types and Formats on the (E C Poulton), 1824
Comprehensive Analytical Chemistry (edited by Prof Cecil L Wilson and David W Wilson), Vol Ia, Classical Analysis, *review* by Dr William I Stephen, 1756
Compressible Fluid Flow Mathematical Theory of (Richard von Mises), (completed by Hilda Geiringer and G S S Ludford), *review* by Dr W P Jones, 485
Compressible Fluids Flow of, *review* by Dr W P Jones, 485
Compston, W, and Jeffery, Dr P M Anomalous 'Common Strontium' in Granite 1792
Computer in Production (Institution of Mechanical Engineers Discussion on), 1613
Computer (Electronic) Experimental Music—Composition with an (Prof L A Hiller, Jr, and Leonard M Isaacson), *review* by Prof E G Richardson, 1754
Computer Applications Report of the Proceedings of the fifth Annual Symposium on, 771
Computer Laboratory at the University of Liverpool, 1537
Computer Society, British First Conference (Dr A S Douglas), 945
Computers Digital (British Council Course on), 1450
Computers (Electronic) Music and, *review* by Prof E G Richardson, 1754
Computing High Speed (Dr S H Hollingdale), *review* by E M Deeley, 1832
Comsa, Dr J Effect of Adrenalectomy on the Hormone Content of the Thymus in the Rat, 279
  Influence of the Thymus upon the Egg-White Allergy in the Rat, 1726
Concave Concentration Gradient of Methanol in Chloroform employed in Elution of Lipids from Silicic Acid (J J Wren), 816
Concentrated Urea Solutions Effect of, on the Infectivity and Haemagglutinin of Vaccinia Virus (Prof J F McCrea and Jean O'Loughlin), 1497
Concentration of Caesium-137 in the Coastal Waters of Japan, 1959 (Noboru Yamagata), 1813
Concentration by Ion Flotation (Prof F Sebba), 1062
Concentration of Stearic Acid in Monolayers Adsorbed from Solution (George L Gaines, jun), 1139
Concentration (Elevated Plasma Sodium) Effects of, on Sodium and Potassium in the Erythrocyte of the Lizard *Trachysaurus rugosus* (Gray), (P J Bentley), 1403
Concentration (A Low), of certain Blood Constituents observed in Offspring of Alloxan-Diabetic Rabbits (Dr Otakar Sirek and Dr Anna Sirek), 456
Concentration Gradient (A Concave), of Methanol in Chloroform employed in Elution of Lipids from Silicic Acid (J J Wren), 816
Concentrations (Adenosine Di- and Tri-phosphate), in the Early Stages of the Action of Yeast on Glucose Changes in (Dr J O Laws and Dr L H Stickland), 1246
Concentrations (Maximum Permissible), of Radionuclides in Air and in Water for Occupational Exposure Maximum Permissible Body Burdens and (United States National Bureau of Standards, Handbook 69), 939
Concept-Formation and Language Classification, (British Society for the Philosophy of Science Symposium on), 1193
Conception of Evolution—Meeting in Paris (Dr J Ramsbottom), 859
Concepts of Classical Optics (Dr John Strong), *review* by Dr J E Geake, 130
Concepts (Changing), of Management Relationships in Industry—some (British Institute of Management and the Ministry of Labour Conference on) 156
Concepts (Constructive) Formalization of, *review* by Dr Hao Wang, 1435
Conceptual Foundations of Science, *review* by Gerd Buchdahl, 572
Concerning Human Understanding (Prof Nikunja Vihari Banerjee), *review* by Dr D J McCracken, 1571
Conchie, J, and Levvy, Dr G A Localization of β-Glucuronidase in Normal and Cancer Cells, 1709
Conchie, J, and Macdonald, D C Glycosidases in the Mammalian Alimentary Tract, 1233
Conchiolin Remnants in Mother-of-Pearl from Fossil Cephalopoda (Dr. Ch Gregoire), 1157
Conclusion Forty-seven Authors in Search of a, *review* by N W Pirie, 920
Condensation Processes for the Extraction of Radioactivity from Air (Rama), 1789
Conditions (Aseptic) A Simplified Method for the Culture of *Blatella germanica* under (R B Clayton), 1166
Conditions (Diurnal and Nocturnal) Changes in the Lacunal Parenchyma of *Mimosa pudica* in (Hideo Toriyama), 737
Conditions (Dry and Wet) Effect of X-Radiation on the Survival of Yeast in (A Mookerjee), 1502

Conditions (Experimental) Force-Feeding Fish under (Dr J M Dodd, Dr M H I Dodd and Dr C K Goddard), 1660
Conditions (Working), in Industry Fitting the Job to the Worker—a Survey of American and European (European Productivity Agency of the Organization for European Economic Co-operation, Project 335), 422
Condon, Dr E U , and Odishaw, Dr Hugh (edited by) Handbook of Physics, *review* by Prof H Lipson and S G Lipson, 298
Conduction Currents in Liquid *n*-Hexane under Microsecond Pulse Conditions (A Harry Sharbaugh and P Keith Watson), 2006
Conductivity (Thermal), of Binary Gas Mixtures Sensitivity of Catharometers in Gas Chromatography and the (A B Littlewood), 1631
Conen, Dr Patrick E , and others Establishment of Parenchymatous Spleno-Pulmonary Venous Anastomosis, 703
Conferences–Big or Small?, 835
Configuration of 10-Hydroxy-Δ^2-decenoic Acid Biological Origin and (Dr S A Barker, Dr A B Foster, D C Lamb and Dr L M Jackman), 634
Configurational Stability of Deoxyribonucleic Acid in Solution Influence of Counterion Association on the (F Ascoli, C Botre, V Crescenzi, A Mele and Prof A M Liquori), 1482
Confusion Function A Mathematical Model for Perception and a Theoretical (M Hammerton), 1668
Congeners of Pempidine with High Ganglion-blocking Activity (L Bretherick, G E Lee, E Lunt, W R Wragg and N D Edge), 1707
Congo Basin (Central) Nitrogen Content of Rain Water collected in the Humid (J Meyer and E Pampfer), 717
Congo Belge et du Ruanda-Urundi Carte des Sols et de la Vegetation du —6, Yangambi, Planchette 3, Lilanda, A, Sols , B, Vegetation (Notice explicative par P Gilson, P Jongen, A Van Wambeke et L Liben), (Institut National pour L'Etude Agronomique du Congo Belge), 27
Congo (Belgian) Haemoglobin *P* in a Family in the (Dr Paulette Dherte, Dr H Lehmann and Dr J Vandepitte), 1133
    Mammals of the, 155
    Soil Fungi in the, 236
Coniferous Seedlings Antibacterial Substances of, at Different Stages of their Development (R Vamos and L Vida), 915
Conjugated Systems Steric Effects in—Proceedings of a Symposium held at the University, Hull, 1958, by the Chemical Society (edited by Dr G W Gray), *review* by Dr G Eglinton, 1522
Conjugation in *Spirostomum* (Prof B R Seshachar and P B Padmavathi), 1510
Connective Tissue Diaphragms for Analysing the Development of (Prof Hans Selye), 701
Connell, Dr J J Flow Properties of Biological Systems (Measurements of Toughness and Firmness of Fish and of Fish Pastes and Jellies), 1540
Conney, Dr A H , and Burns, Dr J J Stimulatory Effect of Foreign Compounds on Ascorbic Acid Biosynthesis and on Drug-Metabolizing Enzymes, 363
Connor, J Appointed chairman of the National Committee for Geodesy and Geophysics, 1192
Conrad, Dr Herbert, and others Effects of Auxin and Gibberellic Acid on Growth of *Ulothrix*, 556
Conrad, Dr R Ergonomics, its Place in Industry (Mass Communication Systems), B A 20
Consciousness Perception, Attention and (Prof Magdalen D Vernon), B A 45
Consden, Dr R Electrophoresis in Theory and Practice *review*, 84
    Keeping Up to Date with Chromatography, *review*, 1436
Conservation of English Wallpaintings—being a Report of a Committee set up by the Central Council for the Care of Churches and the Society for the Protection of Ancient Buildings, 1119
Conservation in the Scottish Highlands (Scottish Branch of the Institute of Biology Symposium on), 1529
Conservation Foundation Living Resources of the Sea (Dr Lionel A Walford), *review* by Dr F S Russell, 129
Constable, F L Psittacosis Elementary Bodies, 473
Constant, Prof F Woodbridge Theoretical Physics, *review* by Dr R M Tennent, 1832
Constant (Equilibrium), of the Galactokinase Reaction and Free Energy of Hydrolysis of Adenosine Triphosphate (Dr M R Atkinson, Eleanor Johnson and Prof R K Morton), 1925
Constants (Lattice), of Copper dipyridine, dichloride and dibromide Influence of the Size of the Halogen Atom on the Difference between (Vladimir Kupcik and Slavomil Durovic), 1060
Constants σ^* (Taft's) An Attempt at Calculating the (Rudolf Zahradnik), 1865
Constituent (High-Temperature), in Mild Steel Surface-Hardened by Carbo-Nitriding Identification of the (M A H Howes, G T F Jay, K Sachs and D Wilkinson), 1312
Constituents (Blood) A Low Concentration of certain, observed in Offspring of Alloxan-Diabetic Rabbits (Dr Otakar Sirek and Dr Anna Sirek), 456
Constitution of Binary Alloys (Dr Max Hansen), second edition, prepared with the co-operation of Dr Kurt Anderko, *review* by Dr F C Thompson, 1765
Constitutional Diagrams of Uranium and Thorium Alloys (Frank A Rough and Arthur A Bauer), *review* by Dr D E R Hughes, 925
Constrictive Resistance in Thermal Equilibrium Influence of the Thomson Effect on the θ-φ Relationship for a (Dr W Davies), 975
Constructive Concepts Formalization of, *review* by Dr Hao Wang, 1435
Constructivity in Mathematics—Proceedings of the Colloquium held at Amsterdam, 1957 (edited by Prof A Heyting), *review* by Dr Hao Wang, 1435
Consulting Scientists, Association of Election of Officers, 508, 1777
Consumption and Refinery Production, 1957 and 1958 United Kingdom Petroleum Industry Statistics relating to (Petroleum Information Bureau), 855
Contact Catalysis (Dr R H Griffith and J D F Marsh), *review* by Dr E B Maxted, 1262
Contact with Lysozyme Appearance of Granules in the Cytoplasm of Tumour-Cell Cultures in (Dr Carlo Callerio), 202, *erratum*, 508
Continental and Oceanic Areas Depth of Isostatic Compensation and Mohorovičic Discontinuity, etc , in (J N Nanda), 629
Continual Creation of Matter The Steady-Rate Universe and the Deduction of (Prof V A Bailey), 537 , (Prof G Bondi), 537
Continually Renewable Filter A Partial Chemical Characterization of Maize Coleoptile Cell Walls prepared with the Aid of a (Prof Aleksander Kivilaan, Teofila C Beaman and Robert S Bandurski), B A 81
Continuous-Flow Culture of the Filamentous Mould *Penicillium chrysogenum* and the Control of its Morphology (S J Pirt and D S Callow), 307
Continuous-Wave Reflexion (Direct) Apparent Observation of Solar Corpuscular Clouds by (Dr John D Klaus and W Reed Crone), 965
Continuum Radiation from Jupiter Anomalous (Dr Eugene E Epstein), 52
Contour Analysis in Equatoria Meteorology Value of (D H Johnson and Dr H T Morth), 1372
Contractile Mechanism (Sliding Filament), in Tonic Smooth Muscles of Lamellibranch Molluscs Evidence for a (Dr Jean Hanson and Dr J Lowy), 286
Contraction of Striated Muscle A Peripheral Effect of the Bromide Ion on the (Dr D K de Jongh and H A Linnewiel), 1240
Contraction (Muscle) Permanent Set, Supercontraction and Urea-Bisulphite Solubility—the Proton-Transfer Nature of some Changes in Keratin and the Analogy with (Dr P T Speakman), 339
Contractions after Rest Potentiation of, in the Isolated Rat Ventricle Preparation (Dr R L Speirs), 66
Control Infestation—a Service to Agriculture and Food Storage (Ministry of Agriculture, Fisheries and Food), 941
    Pest, 941
    Quality (Quality Control Group of the Textile Institute Conference on), B A 16
    Two Threats to Broadcasting—Political and Commercial (H Carleton Greene), 661
Control of Antheridium Formation in the Fern Species *Anemia phyllitides*, (Dr Ulrich Näf), 798
Control of Government Research and Development Expenditure in Britain, 696
Control of Hatching in the Prediapause Eggs of *Aedes* Mosquitoes (Dr J D Gillett), 1621
Control of its Morphology Continuous-Flow Culture of the Filamentous Mould *Penicillium chrysogenum* and the (S J Pirt and D S Callow), 307
Control of Motor Behaviour Possible Rôle of Higher Proprioceptive Centres in the Perception of Visual Space and in the (Dr B Gurevitch), 1219
Control of Pests and Diseases Biological Problems arising from the (Institute of Biology Symposium on), 1100
Control of Pests and Diseases in Agricultural and Horticultural Crops (G L Hey and K Marshall), *review* by F C Bawden, 1258
Control of Public Expenditure, 857
Control (Automatic), International Federation of Members of the Executive Council, 1450
Control (Central), of Interactions between Behaviour Patterns in a Hemileucine Moth (Dr A D Blest), 1164
Control (Chemical), of Eelworms in Strawberries (R S Pitcher), 25
Control (Endocrine), in Crustaceans (Dr David B Carlisle and Sir Francis Knowles), *review* by Prof J H Welsh, 1761
Control (Genetic), of a Cyclic Growth Pattern in *Neurospora* (Growth Patterns in *Neurospora*), (Dr D R Stadler), 170
Control (Genetic), of Tryptophan Peroxidase-Oxidase in *Drosophila melanogaster* (Corrado Baglioni), 1084
Control (Hormonal) of Selective Feeding in Female *Calliphora erythrocephala* Meig (J Strangways-Dixon), 2040
Control (Maternal), of Ovariole Number in the Progeny of the Migratory Locust (F O Albrecht, M Verdier and R E Blackith), 103
Control (Pattern and), of Sclereid Formation in the Leaf of *Camellia japonica* (Donald F Foard), 1663
Control (Quality), in Electronics Sixth National Symposium on Reliability and, 1362
Control (*Stomoxys*), in Uganda, East Africa (H C M Parr), 829
Control (Treasury), of Expenditure (Observations of the Treasury), (Seventh Special Report from the Select Committee on Estimates, Session 1958-59), 696
Control Research (Pest) Advances in (edited by R L Metcalfe), Vol 2, *review* by F C Bawden 1258
Control and Instrumentation of Reactors Third Reactor School Course on the (Atomic Energy Research Establishment), 1026
Control and Stimulated Animals Quantitative Assay of Compounds in Isolated, Fresh Nerve Cells and Glial Cells from (Prof Holger Hydén), 433
Controlling (Growth-) Action of Human Serum in Cell Culture (Dr Kari Penttinen and Dr Erkki Saxén), 1570
Controversial Equation in Population Ecology (Dr A Milne), 1582 , (W B Yapp), 1582 , (Prof G C Varley), 1583
Conventional and Extra-Terrestrial Flight Behaviour in (Air Commodore W K Stewart), 578
Conversion of Ionospheric Virtual Height-Frequency Curves to Electron Density-Height Profiles (Dr J O Thomas and M D Vickers), (Radio Research Board, Special Report No 28), 1024
Conversion of Light into Chemical Energy in Photosynthesis (Prof Daniel I Arnon), 10, *errata*, 1613
Conversion of Salicylic Acid to Gentisic Acid and *o*-Pyrocatechuic Acid, all Labelled with Carbon-14, in Plants (Dr Ragai K Ibrahim and Prof G H N Towers), 1803
Conversion (Enzymic), of L-Rhamnulose to L-Fuculose in *Escherichia coli* (Laura Frontali and Giorgio Tecce), 1315
Convolvulus pluricaulis Chois Intraspecific Polyploidy and Evolution of Diverse Morphological Forms in (Dr S L Tandon and C P Mzalik), 481
Conway, Dr Elsie, and Forrest, J A Effects of Substituted Phenoxy-Compounds and other Translocated Herbicides on the Rhizome of Bracken, 1416
Cook, Dr A H Carbon Dioxide in Water, in Wine, in Beer and in other Beverages, *review*, 302
    Promoted to Senior Principal Scientific Officer in the Scientific Civil Service, 858 , work of 858
    Obituary of Sir Ian Heilbron 767
Cook, Dr C L At the Second Australian Spectroscopy Conference (Some Molecular Spectra excited by Shock Waves), 1197
Cook, Prof Elton S (Tokushige, Ambrose M , and) Thermal Decarboxylation of some Keto-Acid Hydrazones, 267

Cook, G B Radioactivation Analysis (Introductory Survey), 951
Cook, Dr J W (edited by) Progress in Organic Chemistry, Vol 4, *review* by Dr K H Overton, 1439
Cook, Dr R W E Light from the Corona Discharge, 1055
Cooke, A T K *Gloeosporium* in Apple Stem Wounds, 244
Cooke, Dr G W Availability of Plant Nutrients (Assessing the Nutrient Status of a Soil) 160
Cooksey, C J The Electric Arc in Welding, 1031
Coombs, Dr D S, and Hatherton, Dr T Palaeomagnetic Studies of Cenozoic Volcanic Rocks in New Zealand, 883
Coons, Dr A H (Sercarz, Dr E, and) Specific Inhibition of Antibody Formation during Immunological Paralysis and Unresponsiveness, 1080
Cooper, Dr L H N Polar Front Survey (Hydrography—North Atlantic Ocean), 1182
Cooper Union's Museum for the Arts of Decoration Paper-folding Exhibit, 770
Co-operation Partnership for Progress—International Technical (Annals of the American Academy of Political and Social Science, May 1959), *review* by R Brightman, 1673
Co-operation (University), in the Commonwealth (Home Universities Conference, 1959), 1613
Co-operative Phenomena (Prof Lars Onsager), 1195
Coops, J Thermodynamics (Experimental Thermochemistry), 1608
Co-ordinated Chromatic Responses Significance of the Time Relations of Humorally (Dr A K Kent), 2027
Coote, J L, and others Protein Biosynthesis and Oxidative Phosphorylation in Isolated Rat Liver Mitochondria, 165
Copernic Le Système du Monde—Histoire des Doctrines Cosmologiques de Platon a (Prof Pierre Duhem), Tome 10, *review* by Prof E J Dijksterhuis, 836
Copisarow, Dr Maurice *Obituary* by Prof T K Walker, 315
Copland, W O, and Delany, M J At the Conference of the Mammal Society of the British Isles (Small Mammals of South Rona), 30
Copley, Prof A L Flow Properties of Biological Systems (Nature of the Flow-curve of Blood in Glass Capillaries), 1540
Copley Medal for 1959 of the Royal Society awarded to Sir Macfarlane Burnet, 1189, 1833 , work of, 1833
Copp, F C, and others New Antiadrenergic Compounds B A 70
Copp, Dr J L Appointed senior lecturer in chemistry at Queen's College, Dundee, 684
Copper Effect of Polycyclic Aromatic Hydrocarbons on the Polarographic Maximum of (C E Searle), 1716
  Quadrupole Anti-Shielding Factor in (E A Faulkner) 442
  Swellings on the Shoots of Cacao Plants Deficient in (Dr R G Lockard, P Vamathevan and S Thamboo), 75
Copper-deficient Sheep Experiments on Wool from (R W Burley and F W A Horden), 1725
Copper-Catalyst Blocking Agent Inhibition of Rous I Sarcoma Metastases by a (Dr B M Jones), 1963
Copper (II) (Histidine–) Complexes (Dr D D Perrin), 1868
Cu, Ag, Au (Coinage Metals) Electron Spin Resonance and Divalency of some Dithiocarbamates of the (Tore Vanngard and Stig Åkerstrom), 183
Copper Chelating Theory of their Mode of Action Plant-Growth Substances and the (Dr C H Fawcett), 796
Copper dipyridine, dichloride and dibromide Influence of the Size of the Halogen Atom on the Difference between Lattice Constants of (Vladimir Kupcik and Slavomil Durovic), 1060
Copper-ethylene-diamine-*bis* (acetylacetone) in the Crystalline State Visible Absorption Spectra of (Animesh Chakravorty and Dr Sadhan Basu), 50
Copulation of *Glyptotendipes* (*Phytotendipes*) *paripes* Edwards (Dr Eric T Nielsen), 1252
Coregonus lavaterus Rete Mirabile in the Gas Bladder of (Goran Fahlen), 1001
Corlett, J Polar Front Survey (Biology—Zooplankton collected at Weather Stations *I* and *J*), 1184
Cormier, Leonard (edited by L V Berkner, in association with Gilman Reid, John Hanessian, Jr , and) Manual on Rockets and Satellites, *review*, 213
Corn (Field), *Zea mays L* , in Canada Isolation of the Antifungal Substance, 6-Methoxybenzoxazolinone, from (N J Whitney and C G Mortimore), 1320
Corn Borer (European), *Ostrinia nubilalis* (Hbn) (Lepidoptera Pyralidae) Chemical Changes associated with Diapause in the (J A Mutchmor and J H Maruzek), 1077
Cornish Scenery Preservation of, 1776
Corona (The Inner Solar), during June 1959 (G A Newkirk, G W Curtis, D K Watson, R Manning and J Shelby), 1308
Corona (Solar) Kellogg and Ney's Model of the (Dr D E Blackwell and Dr D W Dewhirst), 1120 , (Prof Edward P Ney and Prof Paul J Kellogg), 1122
Corona Discharge Light from the (Dr R W E Cook), 1055
Cormack, Dr A M Nuclear Forces and the Few-Nucleon Problem (Scattering of Nucleons by Light Nuclei at High Energy), 1113
Corpuscles of Stannius from Winter Flounder (*Pseudopleuronectes americanus*) to Synthesize Adrenocorticosteroids *in vitro* Failure of (Dr J G Phillips and Dr P J Mulrow), 558
Corpuscles (Red Blood) Effect of Polyphloretin Phosphate on the Suspension Stability of (Dr Bengt Fries), 62
Corpuscular Clouds (Solar) Apparent Observation of, by Direct Continuous-Wave Reflexion (Dr John D Klaus and W Reed Crone), 965
Correlation between Earth-Current and Geomagnetic Disturbance (V P Hessler and E M Wescott), 627
Correlation between the Intensity of the Umbra of Sunspots and Enhanced Radiation on 200 Mc /s (Per Maltby), 1391
Correlation between the Shift in the Ultra-Violet Absorption Maxima and the Electronegativity of the Adjacent Atoms in some Aliphatic Carbonyl Compounds (Dr P Borrell), 1932
Correlation (Photon) Polarization and Resolving Time Effects in (Dr E Brannen and Prof W Wehlau), 263
Correns, Prof C W Elected president for 1960 of the Commission on Geochemistry of the International Union of Pure and Applied Chemistry, 1193
Corrosion Study of, 1023
Corrosion Fatigue Life of Steel Relationship of *p*H to Aerobic (Dr Frederick J Radd, L Hugh Crowder and Louis H Wolfe), 2008
Cortex (Brain) *in vitro* Carbohydrate—Amino-Acid Inter-relations in (M M Kini and Prof J H Quastel), 252
Cortex (Visual), of the Unanaesthetized Cat Evoked Potentials in (Gabriel Horn and John Blundell), 173
Corticosteroids Paper Chromatography of, at Room Temperature (J Ruzson), 1937
Corticosterone Inhibition of Pyridine Nucleotide Oxidase from Heart Sarcosomes (P K Jensen), 451
Cortisol (Blood), in the Sheep—Normal Concentration and Changes in Ketosis of Pregnancy (H R Lindner), 1645
Cortisone and Insulin Combined Effects of, on Developing Chicken Embryos (Dr Pietro de Franciscis and Prof Walter Landauer), 101
Corynomycilic Acid Biosynthesis of, from Two Molecules of Palmitic Acid (Dr Mireille Gastambide-Odier and Prof E Lederer), 1563
Cosmic Electrodynamics (Dr J W Dungey), *review* by Prof V C A Ferraro, 1672
Cosmic Noise at Low Frequencies above the Ionosphere Measurement of (J P I Tyas, C A Franklin and A R Molozzi), 785
'Cosmic Ray Age' for the Iron Meteorite (Carbo) Calculation of a (Dr Royal R Marshall), 117
Cosmic Ray Energy Spectrum Changes Evidence for, during a Forbush Decrease (K W Ogilvie and M M Winn), 888
Cosmic-Ray Storm of February 11, 1958 North–South Anisotropy and Anticipatory Increase of Intensity associated with the (Dr V. Sarabhai and R Palmeira), 1204
Cosmic Rays in Space Change of (Prof H V Neher), 423
Cosmic Rays (Solar) Satellite Observations of (Pamela Rothwell and Carl McIlwain) 138
Cosmical Electrical Discharges The Temperature required for Nuclear Reactions in (Dr C E R Bruce), 2004
Cosmology History of, *review* by Prof E J Dijksterhuis, 836
Cosslett Dr V E X-Ray Microscopy and X-Ray Microanalysis, 860
Cost of Labour Turnover (British Institute of Management), 1110
Costa, Dr Luiz Macedo, and Csapo, Dr Arpad Asymmetrical Delivery in Rabbits, 144
Costoulas, A J At the Second Australian Spectroscopy Conference (Vibrational Assignment for Methyl-isothiocyanate), 1196
Cotton in Tropical Africa The Insect Pests of (E O Pearson, assisted by R C Maxwell Darling), *review* by Dr W E China, 1011
Cotton-Grass (*Eriophorum vaginatum* L) Mineral Uptake and Retention in (Gordon T Goodman and Donald F Perkins), 467, *erratum*, 1845
Cotton Industry Research Association, British Fortieth Annual General Meeting, 1846
  Open Days at the Shirley Institute, 1846
Cottonmouth Moccasin Venom labelled with Iodine-131 Distribution in the Mouse of Lethal and Sub-Lethal Doses of (Prof J F Gennaro, jun , and H W Ramsey), 1244
Cottrell, A H Atomic Mechanisms of Fracture (The Brittle–Ductile Transition), 325
Cotzias, George C, and others Thirst for Bile in Rats with Bile Fistulae, 1405
Coudert Prof Jean Action of *Trypanosoma cruzi* Extracts on Cancer Cells, 1115
Coulson, Prof J M Fluid Systems, *review*, 132
Coumarin Joint Action of Gibberellic Acid and, in Germination (A M Mayer), 826
Council for Nature Resolutions passed at the Annual General Meeting, 769
Countercurrent Distribution A Paper-Chromatographic Method for the Determination of Suitable Buffer Systems for (Andrzej Waksmundzki and Edward Soczewinski), 977
Countercurrent (South Equatorial), in the Pacific Ocean Evidence of a (Joseph L Reid, jun), 209
Counter-Current Distribution of Proteins in Aqueous Polymer Phase Systems (Per-Ake Ålbertsson and Ed Jacques Nyns), 1465, *erratum*, 1688
Counterion Association Influence of, on the Configurational Stability of Deoxyribonucleic Acid in Solution (F Ascoli, C Botre, V Crescenzi, A Mele and Prof A M Liquori), 1482
Counting (Bubble), on Low-Energy Particle Tracks (I R Birss), 1474
Countries (Under-developed) Assistance for, 1363
  Distribution of Scientific Publications in (Scientific Publications Council Discussion on), B A 22
  Management Problems in, 483
Country House and the Museum (Museums Association Discussion on), 598
Coursaget, J , and others (edited by) Biological Sciences, Vol 2 (Progress in Nuclear Energy, Series 6), *review* by Prof G Pontecorvo, 1902
  Medical Sciences, Vol 2 (Progress in Nuclear Energy, Series 7), *review* by Dr N M Blackett, 1766
Course on the Basic Techniques of Handling Radioisotopes (United States Atomic Energy Commission), 771
Course on the Control and Instrumentation of Reactors Third Reactor School (Atomic Energy Research Establishment), 1026
Course of Development Haemoglobin Pattern of the Cyclostome *Pertromyzon planeri* during the (M Adinolfi, G Chieffi and M Siniscalco), 1325
Course on Digital Computers (British Council), 1450
Course of Lectures on the Land of Britain—is it Used to the Best Agricultural Advantage? (Association of Agriculture and the Extra-Mural Department of the University of London), 1845
Course of Lectures on Newer Developments in the Chemistry of the Non-Metals (Kingston Technical College), 1915
Course of Lectures and Practical Work on Micro- and Semi-microchemical Methods (Norwood Technical College), 1845
Course in New Techniques in High Polymer Chemistry (Bradford Institute of Technology), 1845
Course in Statistics A First (Robert Loveday), *review* by J Durbin, 1008
Course on the Use of Radioisotopes in Agricultural Research (Ministry of Food and Agriculture of the Government of India, Food and Agriculture Organization of the United Nations, International Atomic Energy Agency and Unesco South East Asia Science Co-operation Office), 1451

Course (Full-time), in Chemical Engineering Scheme for a (Institution of Chemical Engineers), 856
Course (Regional Training), on Diagnosis, Improvement and Management of Salt-affected Soils (Unesco Middle East Science Co-operation Office), 1778
Course (Regional Training), for Laboratory Technicians (University Institute of Chemistry, Lahore), 857
Course (Sandwich), in Executive Development (Sheffield College of Technology), 235
Courses Postgraduate, 1959-60 (Imperial College of Science and Technology), 235
Courses at the Harwell Reactor School (Atomic Energy Research Establishment), 942
Courses (NATO Scientific) British Aid for, 406
Courses (Sandwich), for Teaching Technologists and Technicians (Dr P F R Venables), *review*, 1437
Covell, Sir Gordon Biological Problems arising from the Control of Pests and Diseases (Control of Human Diseases in Tropical Areas), 1101
Cowan, M J, and others Energy Transfer with special reference to Biological Systems (Chelates of Iron as Models for the Understanding of the Variations in Spectrum and Redox Potential of the Cytochromes), 690
Cowan, S T, and Rowatt, E (edited by) The Strategy of Chemotherapy —Eighth Symposium of the Society for General Microbiology, 1958, *review* by Prof H Berry, 133
Cowbird's Pituitary Prolactin in the, in relation to Avian Brood Parasitism (Prof E O Hohn), 2030
Cowen, Prof P N Splenic Siderosis in Mice treated with Dithiourethane, 366
Cowen, Prof P N (Ball, Dr J N, and) Urethane as a Carcinogen and as an Anaesthetic for Fishes, 370
Cowie, Dr J W The Geological Development of North America, *review*, 1600
Cowling, Prof T G Thermonuclear Research (Mechanical Effects of the Interaction between a Plasma and a Magnetic Field), 1017
Cows Implications of Restricting, to a Clover-free Diet in order to Reduce the Strontium Content of Milk (Dr David Purves), 1408
Cows treated with Penicillin Lowered Bactericidal Efficiency of Hydrogen Peroxide on Milk from (J Babad, D L Boros and F Baier), 292
Cox, Dr D R Planning of Experiments, 156
Cox, Prof E G Appointed secretary of the Agricultural Research Council, 1688
Cox, Dr G S (Block, B P and) Effect of Diet on the Blood Sugar and Liver Glycogen Level of Normal and Adrenalectomized Mice, 721
Cox, J D Thermodynamics (Experimental Thermochemistry), 1607
Cox, J T (Bridges, R G, and) Resistance of Houseflies to γ-Benzene Hexachloride and Dieldrin, 1740
Cox, Dr R A Polar Front Survey (Hydrography—Work of the R R S *Discovery II* in the North Atlantic Ocean), 1182
Cox, Dr R A, and Littauer, Dr U Z Secondary Structure of Ribonucleic Acid in Solution, 818
Cox, Ronald R Awarded a Perkin Centenary Scholarship, 237
Coyle, James Awarded a junior post-graduate agricultural research scholarship by An Foras Taluntais (the Agricultural Institute of Ireland), 1612
Crab (The Hermit), *Eupagurus bernhardus* The Sea Anemone (*Calliactis parasitica*) and (Dr D M Ross), 1161
Crack Behaviour at a Weld Structure Discontinuity (F J Radd), 543
Craddock, J M Promoted to Senior Principal Scientific Officer in the Scientific Civil Service, 858, work of, 858
Cragg, Dr B G Awarded a Locke Research Fellowship by the Royal Society, 595
  A Specific Response in the Hippocampus of the Rabbit to Olfactory Stimulation, 1697
  A Heat-Loss Mechanism involving the Habenular, Interpeduncular and Dorsal Tegmental Nuclei, 1724
Cragg, Prof J B Practical Animal Ecology, *review*, 1262
Cragg, Dr Thomas, and others Magnetic Field associated with a Great Solar Flare, 351
Craggs, J D (Prasad, A N, and) Ionization Phenomena in Gases (Recent Measurements on the Growth of Pre-breakdown Ionization Currents for Air), 1354
Craigmyle, M B L Cartilage Homografts in Papain-injected Rabbits, 1243
Cramer, Dr Friedrich Papierchromatographie, vierte Auflage, *review* by Dr R Consden, 1436
Cramp caused by Phenol Effect of Flavins on (Prof Kunio Yagi, Dr Hirofumi Yagi and Dr Ikuko Nagatsu), 1648
Crampton, Prof Charles F, and others Mechanism of Immunological Unresponsiveness, 873
Cranberg, Dr L Nuclear Forces and the Few-Nucleon Problem (Binding Energies and Elastic Scattering of Light Nuclei at Low Energies), 1114
Cranbrook, Earl of At the Conference of the Mammal Society of the British Isles (The Saliva of the Water Shrew), 29
Cranshaw, T E (Hillas, A M, and) A Comparison of the Charges of the Electron, Proton and Neutron, 892
Cranwell, Lucy M Fossil Pollen from Seymour Island, Antarctica, 1782
Craters on the Far Side of the Moon Absence of (David B Beard), 1631
Crawford, D V Availability of Plant Nutrients, 159
Crawford, Dr J D (Kennedy, Dr G C, and) An Antimineralocorticoid Action of some Saluretic Sulphonamides, 1492
Crawford, M Biological Problems arising from the Control of Pests and Diseases, 1101
Creation (Continual), of Matter The Steady-Rate Universe and the Deduction of (Prof V A Bailey), 537, (Prof G Bondi), 537
Creative Leadership in a State Service—a General Survey (Sir George Schuster), (Hospitals and the State—Hospital Organization and Administration under the National Health Service, Sixth and Final Research Report), 1087, 1201
Creed, E R Awarded a Nature Conservancy Research Studentship for postgraduate training in ecology (zoology), 156
Creed, R F S British Carnivores (Christmas Lecture at the Zoological Society of London), 1535
Creep Tests on Antarctic Glacier Ice (Malcolm Mellor), 717
Creeth, J M, and Nicol, L W Structure and Chemistry of Proteins (Urease), 1277
Creeth, J M, and Winzor, D J Structure and Chemistry of Proteins (Specificity of the Reaction of Iodine with the Sulphydryl Groups of Ovalbumin), 1277
Cremer, Herbert W, and Davies, Trefor (edited by) Chemical Engineering Practice, Vol 6, Fluid Systems II, *review* by Prof J M Coulson, 132
Crescenzi, V, and others Influence of Counterion Association on the Configurational Stability of Deoxyribonucleic Acid in Solution, 1482
Cresols and Toluidines Separation of the *Meta*- and *Para*-Isomers of the Xylenes, by Gas Solid Chromatography (M A Hughes, D White and Prof A L Roberts), 1796
Crespi, Henry L, and others Culture of Algae and other Micro-organisms in Deuterium Oxide, 729
  Chloroplast Pigments of Deuterated Green Algae, 730
Creutzberg, F Discrimination between Ebb and Flood Tide in Migrating Elvers (*Anguilla vulgaris* Turt) by means of Olfactory Perception, 1961
Crick, Dr Francis H C The Structure of Science, B A 8
Crisp, R S At the Second Australian Spectroscopy Conference (Vacuum Spectroscopic Technique—a Grazing Incidence, Photon-counting Grating Spectrometer), 1196
Cristae of the Elasmobranch *Raja clavata* A Functional Interpretation of the Electron-Microscopic Structure of the Sensory Hairs in the, in Terms of Directional Sensitivity (Prof O Lowenstein and J Wersall), 1807
Critical Importance of Transport and Communications (Sir Ewart Smith), B A 44
Crocker Sarcoma and Ehrlich Ascites Carcinoma Effect of Chlorpromazine on (Prof M Chorazy), 200
Croft, Eric D Oil Pollution of the Sea (Loss to the Tourist Trade presented by the Pollution of Beaches), 950
Croghan, Dr P C (Lockwood, Dr A P M, and) Composition of the Haemolymph of *Petrobius maritimus* Leach, 370
Croizat, Dr Léon Panbiogeography, or an Introductory Synthesis of Zoogeography, Phytogeography and Geology, Vol I, The New World, Vol 2a, The Old World, Vol 2b, The Old World (continuation), *review* by Prof Ronald Good, 924
Crone, W Reed (Klaus, Dr John D, and) Apparent Observation of Solar Corpuscular Clouds by Direct Continuous-Wave Reflexion, 965
Crook, A E Awarded the Douglas Hay Medal of the Institution of Mining Engineers, 1845
Crookall, J O, and others Current Trends of Strontium-90, Strontium-89 and Caesium-137 Levels in Milk, 89
Croom, Sheila, and others Two Anomalies in the Behaviour of the F2 Layer of the Ionosphere, 2003
Crop Protection The Principles and Practice of, *review* by F C Bawden, 1258
  The Scientific Principles of (Hubert Martin), fourth edition, *review* by F C Bawden, 1258
Crops (Agricultural and Horticultural) The Control of Pests and Diseases in (G L Hey and K Marshall), *review* by F C Bawden, 1258
Crops (Farm) Recognition of Diseases and Pests of (Ernst Gram, Prosper Bovien and Chr Stapel), *review* by F C Bawden, 1258
Crops (Glasshouse) Research Institute Annual Report for 1957, 161
Crops (Marine Standing) Proximate Analysis of (Dr T R Parsons and Dr J D H Strickland), 2038
Crosby, Dr D G (Vlitos, Dr A J, and) Isolation of Fatty Alcohols with Plant-Growth Promoting Activity from Maryland Mammoth Tobacco, 462
Cross, Dr J R Appointed superintendent of the Chemistry Laboratories in the University College of Swansea, 156
Cross, Dr L E Ferroelectricity, *review*, 6
Cross-Linking of Cellulose Acetate by Ionizing Radiation (Dr S H Pinner, T T Greenwood and D G Lloyd), 1303
Cross-Linking of Deoxyribonucleic Acid in Sperm Heads by Ionizing Radiations (Dr P Alexander and Dr K A Stacey), 958
Cross-Linking of Rubber Estimation of Chain Fracture and, by High-Energy Radiation (P Hayden), 1865
Crossed Polars A Special Case of the Superposition of Crystal Plates between, and its Bearing on the Microscopy of Cellulosic Fibres (Dr N H Hartshorne), 179
Crossing-over in *Drosophila melanogaster* Effect of Different Wild-type Isoalleles on (M M Green), 294
'Crossing-Paper Electrophoresis' Proof of the Formation of Enzyme-Substrate Complex by (Prof S Nakamura, K Takeo, I Sasaki and M Murata), 638
Crossley, P A (Butland, A N P, and) Science by the Upper Form (Some Scientific Aspects of the River Ouse), 597
Crouch, E A C, and others Atomic Weight of Silver, 358
Crow, Duncan Commonwealth Education—the United Kingdom Contribution, 592
Crowcroft, Peter North American Mammals, *review*, 1524
Crowder, L H (Radd, F J, and) Solid State Rheological Study of the Mechanism of Paraffin-Detergent Interactions in Aqueous Systems, 443
Crowder, L H, and others Relationship of *p*H to Aerobic Corrosion Fatigue Life of Steel, 2008
Crowe, G R Honorary degree of M A of the University of Cambridge conferred on, 1108
Crowe, P F, and others Gas Chromatographic Separation of Long-chain Fatty Acid Methyl Esters on Polyvinyl Acetate, 1710
Crown-Gall Tissue Extracts (Tomato) Occurrence of 3-Indolylacetic and 3-Indolecarboxylic Acids in (G Clarke, M H Dye and Prof R L Wain), 825
Crown Gall Tumour Induction A Possible Rôle of Indoleacetic Acid Oxidase in (Dr Jacques Lipetz), 1076
Croxatto, Prof H, and others Peptides with Oxytocic and Pressor Activity obtained from Acidified Rat Serum, 1496
Crude Vegetable Oils Chromatographic Identification of the Antilipaemic X Factor of the Unsaponifiable Fraction of (Prof M C Nath, A Saikia and B I Uppin), 1635
Cruickshank, Dr A J O Appointed reader in electrical engineering at Queen's College, Dundee, 684
Cruickshank, C N, and others Delayed Hypersensitivity ('Tuberculin-like' Reactions to Trichophytin in Guinea Pigs), 1030

Cruickshank, J G (Gresham, Dr G A, and) Protein Synthesis in Macrophages containing *Eimeria tenella*, 1153
Crushing and Grinding (Department of Scientific and Industrial Research), *review* by Prof S G Ward, 1177
Crussard, C, *et al* Atomic Mechanisms of Fracture (Value of the Electron Microscope in the study of Fractures), 325
Crustacea Syncarid, 1914
Crustaceans Hormone Control in (Dr David B Carlisle and Sir Francis Knowles), *review* by Prof J H Welsh, 1761
  Hormones in *review* by Prof J H Welsh, 1761
Cryogenic Engineering (Dr Russell B Scott), *review* by Dr G G Haselden, 1174
Cryptomonad Flagellates Chromoprotein Pigments of some (Photoreactive Pigments in Flagellates), (Dr Mary Belle Allen, Dr Ellsworth C Dougherty and Dr John J A McLaughlin), 1047
Cryptomonads Photosynthetically Active Accessory Pigments of (Photoreactive Pigments in Flagellates), (Dr F T Haxo and D C Fork), 1051
  Phycoerythrins and Phycocyanins of (Photoreactive Pigments of Flagellates), (Dr C ÓhEocha and M Raftery), 1049
Crystal Defects Influence of, on the Szilard-Chalmers Process in Solids (Dr A G Maddock and J I Vargas), 1931
Crystal Physics (British Association for the Advancement of Science, Section A (Mathematics and Physics), Discussion on), 596
Crystal Plates between Crossed Polars A Special Case of the Superposition of, and its Bearing on the Microscopy of Cellulosic Fibres (Dr N H Hartshorne), 179
Crystal Structure of L-Serine Phosphate (G H McCallum, Prof J Monteath Robertson and Dr G A Sim), 1863
Crystal Systems (Liquid), from Fibrillar Polysaccharides (R H Marchessault, F F Morehead and N M Walter), 632
Crystal (Single-) Electron Diffraction Pattern Structure of Precipitated Cadmium Sulphide as studied by (Dr Ryoitiro Sato), 2006
Crystalline Cytochrome b_5 (Dr Isaias Raw and Walter Colli), 1798
Crystalline Electric Field in Cobalt Acetate Tetrahydrate Temperature Variation of the Principal Magnetic Moments of Co^{++} Ions and the Asymmetry of the (Dr Bhagawati Charan Guha), 50
Crystalline *trans-trans* Methyl Linoleate Hydroperoxide Preparation of (A Banks, S Fazakerley, J N Keay and J G M Smith), 816
Crystalline Needles Appearance of, in Monkey Kidney Cell Cultures Infected with Poliomyelitis Virus and Incubated at 22-30° C (Dr Esther Tenenbaum), 1657
Crystalline Salt (A New), of Oxytocin (Dr Miklos Bodanszky and Prof Vincent du Vigneaud), 981, *erratum*, 1777
Crystalline Silica (Fused and) Structural Defects in (Dr W C Levengood), 1476
Crystalline State Visible Absorption Spectra of Copper-ethylene-diamine-*bis* (acetylacetone) in the (Animesh Chakravorty and Dr Sadhan Basu), 50
Crystallographic Studies of the Biuret Reaction (Dr H C Freeman, J E W L Smith and J C Taylor), 707
Crystallography (X-Ray) The Powder Method in (Prof Leonid V Azároff and Prof Martin J Buerger), *review* by Prof H Lipson, 1599
Crystals Ferroelectricity in (Dr Helen D Megaw), *review* by Dr L E Cross, 6
  Intermolecular Distances and Diamagnetic Anisotropy in, as Measures of the Polarity of Benzene and Borazole Substituents (Dame Kathleen Lonsdale), 1060
  Twinning of (International Mineralogical Association Symposium on), 1910
Crystals (Ice), grown in Hydrogen, Carbon Dioxide and Air at Reduced Pressure Habit of (A P van den Heuvel and Dr B J Mason), 519
Crystals (Mercuripapain) The Unit Cell of (J Drenth and J N Jansonius), 1718
Crystals (Polymer Single) Evidence for Distinct Sectors in (D C Bassett, Prof F C Frank and Dr A Keller), 810
Crystals (Zinc Single) Fatigue-Induced After-Effect in (A H Melaka and G B Dunn), 896
Csapo, Dr Arpad (Costa, Dr Luiz Macedo, and) Asymmetrical Delivery in Rabbits, 144
Ctenophore *Bolinopsis infundibulum* (O F Muller) Feeding of a (A K Nagabhushanam), 829
Cuba and the Isla de Pinos Variation in Lizards of the *Leiocephalus cubensis* Complex in (Albert Schwartz), 1107
Cubero, Dr Felisa Nuñez Awarded a Spanish Fellowship in Chemistry for 1959-60 by the Ramsay Memorial Fellowships Trustees, B A 16
Cubic Boron Nitride Transformation of a, to a Graphitic Form of Hexagonal Boron Bitride (H Judith Milledge, E Nave and F H Weller), 715
Culex fatigans Wied (1828) Induced Mutations of X-Ray Irradiations in (R Pal and B S Krishnamurthy), 658
Cullis, Dr C F Oxidation of Organic Compounds (Oxidation of Inorganic and Organic Compounds by Permanganate), 326
Cultivated Tea Top Growth of (Dr D N Barua), 1424
Cultivation of HeLa Cells Discarded Blood Bank Blood as a Source of Protein for (Billy R Blakey and Prof George E Gifford), 1158
Cultivation (*In vitro*), of Blood Cells of *Drosophila melanogaster* in a Synthetic Medium (Dr Masakatsu Horikawa and Dr Yukiaki Kuroda), 2017
Cultural Property, International Centre for the Study of the Preservation and Restoration of Inauguration of the, 504
  Appointment of Dr H J Plenderleith as first director, 504
Culture Cell and Organ (British Association for the Advancement of Science, Section I (Physiology and Biochemistry), Discussion on), 935
  Cell and Tissue (Dr John Paul), *review* by Dr I Leslie, 1009
  Production of Serum Albumin and of Globulins by Chick Mesenchymal Tissue and by HeLa Tumour Tissue in (Y Abdel-Samie, Prof E Broda, G Kellner and W Zischka), 361, *erratum*, 943
  X-Ray Damage and Recovery in Mammalian Cells in (M M Elkind and Harriet Sutton), 1293
Culture of Algae and other Micro-organisms in Deuterium Oxide (Henry L. Crespi, Sylvia M Archer and Joseph J Katz), 729
Culture of *Blatella germanica* under Aseptic Conditions A Simplified Method for the (R B Clayton), 1166
Culture of Cells, *review* by Dr I Leslie, 1009
Culture (Cell) Growth-Controlling Action of Human Serum in (Dr Kari Penttinen and Dr Erkki Saxen), 1570
Culture (Continuous-Flow), of the Filamentous Mould *Penicillium chrysogenum* and the Control of its Morphology (S J Pirt and D S Callow), 307
Culture (*In vitro*), of the Inflorescences, Flowers and Ovaries of an Apomict, *Aerva tomentosa* Forsk (Prem Murgai), 72
Culture (Indian) The Pre-historic Background of (Colonel D H Gordon), *review* by M C Burkitt, 131
Culture (Pure) of the Pathogenic Agent of Tyzzer's Disease of Mice (Dr K. Kanazawa and A Imai), 1810
Culture (Tissue) An Attenuated Strain of Canine Distemper Virus in (Prof Gunnar Rockborn), 822
  Transformations of Myxoma into Vaccinia or Ectromelia Virus in (Hidesaburô Hanafusa, Teruko Hanafusa and Juntarô Kamahora), 1152
Culture (Tsetse Fly Tissue) Development of *Trypanosoma vivax* to the Infective Stage in (Dr William Trager), B A 30
Culture Cells (Human Tissue) Cellular Uptake of Deoxyribonucleic Acid by (Dr Stanley M Gartler), 1505
Culture Medium Estimation of μgm Quantities of Iron in, using Bathophenanthroline (P A Seamer), 636
Cultured Human Tissues Sex Chromatin in (Dr Charles P Miles), 477
Cultures of Calf Kidney Cells Interferon produced by (Dr D A J Tyrrell), 452
Cultures (Agar and Soil) Translocation of Cobalt-60 and Caesium-137 by Fungi in (Dr Erna Grossbard and Dr D R Stranks), 310
Cultures (Dextran-producing), of *Streptococcus bovis* Formation of Leucrose in (R W Bailey and Prof E J Bourne) 904
Cultures (Monkey Kidney Cell), infected with Poliomyelitis Virus and Incubated at 22-30° C, Appearance of Crystalline Needles in (Dr Esther Tenenbaum), 1657
Cultures (Organ) of Total Mammary Glands of the Mouse (Dr F J A Prop), 379
Cultures (Roller Tube Tissue) Use of Transparent Cellular Film for (John A Sharp), 1508
Cultures (Plant Tissue) Oxidative and Phosphorylative Activities of Cytoplasmic Particles from (Taiki Tamaoki, Prof A C Hildebrandt, A J Riker, R H Burris and Bunji Hagihara), 1491
Cultures (Tumour-Cell), in Contact with Lysozyme Appearance of Granules in the Cytoplasm of (Dr Carlo Callerio), 202, *erratum*, 508
Cultures (Two), and the Scientific Revolution (Sir Charles Snow), 295
Cultures (The Two), and the Scientific Revolution (Dr W L Sumner), 411
Cummack, C H, and King, G A M Disturbance in the Ionospheric F-Region following the Johnston Island Nuclear Explosion, B A 32
Cumming, Dr Bruce G Extreme Sensitivity of Germination and Photoperiodic Reaction in the Genus *Chenopodium* (Tourn) L, 1044
Cummins, Dr C S, and Harris, Dr H Taxonomic Position of *Arthrobacter*, 831
Cundy, E K (Windle, W, and) Clay Minerals (Occurrence of Zinnwaldite in Cornwall), 780
Cupps, P T (edited by Cole, H H, and) Reproduction in Domestic Animals, Vol I, *review* by Dr S J Folley, 1091
Curare and Curare-like Agents (edited by D Bovet, F Bovet-Nitti and G B Marini-Bettelo), *review* by Dr Marthe Vogt, 1093
Curative Effect of Selenium upon the Incisor Teeth of Rats deficient in Vitamin E (Prof J T Irving), 645
Curien, Dr H Twinning of Crystals (Degree of Symmetry which a Twin Axis may possess), 1810
Curnow, R N Statistics of Extremes, *review*, 754
Curran, Dr S C Appointed director of the Royal College of Science and Technology, Glasgow, 152, work of, 152
Current (Counter-) Evidence of a South Equatorial, in the Pacific Ocean (Joseph L Reid, jun), 209
Current (Counter-) Distribution of Proteins in Aqueous Polymer Phase Systems (Per-Åke Albertsson and Ed Jacques Nyns), 1465, *erratum*, 1688
Current (Ionic) Effects of the Energy of Strong Pulses of, on Micro-organisms in Suspension (B S Gossling), 1881
Current Fluctuations in the Oxide Cathode (Margaret Chisholm and Dr. L Jacob), 1058
Current Literature Index Cancer (Excerpta Medica Foundation), 941
Current Research on Noise (Derwent M A Mercer), 414
Current-Saturation Plasma Heating by (K A George), 1791
Current Trends of Strontium-90, Strontium-89 and Caesium-137 Levels in Milk (W Anderson, L K Burton and J O Crookall), 89
Currents (Conduction), in Liquid *n*-Hexane under Microsecond Pulse Conditions (A Harry Sharbaugh and P Keith Watson), 2006
Curry, Dr A S, and others Absorption of Zinc Phosphide Particles, 642
Curry, James B, and others Macromolecular Components of *Chlorella pyrenoidosa*, 963
Curtis B, and others Phospholipid Phosphoric Esters in the Human Placenta, 1870
Curti., G W, and others The Inner Solar Corona during June 1959, 1308
Curves (Titration), of Soil Organic Matter (R S Beckwith), 745
Cushing, Dr D H (Lee, A J, and) International Council for the Exploration of the Sea—Special International Geophysical Year Meeting, 1180
Cushion, A A (Logan, Dr W P D, and) Morbidity Statistics from General Practice, Vol I, General (Studies on Medical and Population Subjects No 14), 154
Customs and Religion of the Ch'iang (D C Graham), B A 15
Cutaneous Melanoma in Killifish Hybrids Effect of Thiourcil and Thyroxine on Development and Growth of (Prof A Stolk), 562
Cuthbertson, Dr D P Rumination, *review*, 839
Cuticle of Insects Secretion of Wax through the (Dr M Locke), 1967
Cutler, D, and Powles, Dr J G Molecular and Atomic Motions in Liquids and Solids by Radiofrequency Methods, 158
Cutler, D (Powles, Dr J G, and) Proton Resonance Relaxation Times in Mobile Liquids, 1123
Cutrona, Prof Louis J Appointed head of the Willow Run Radar Laboratory in the University of Michigan, 26
Cutteridge, Dr O P D Modern Network Theory in Electrical Engineering (Application of a Particular Continued-Fraction Expansion to a range of Problems of Active and Passive Networks), 1692
Cutting, Windsor C, and others Phenazine Di-*N*-Oxide as a Carcinostatic Agent, 908
Cuttlefish Buoyancy of the (Dr E J Denton and Dr J B Gilpin-Brown), 1330

Cyanocarbon Organic Compounds Histochemical Use of the (Prof John F Lhotka), 1153
Cyathostoma lari, Blanchard 1849 (Nematoda, Strongyloidea) Life-Cycle of (Dr R T Pemberton), 1423
Cyclic Growth Pattern in *Neurospora* Genetic Control of a (Growth Patterns in *Neurospora*), (Dr D R Stadler), 170
Cyclostome *Pertromyzon planeri* Haemoglobin Pattern of the, during the Course of Development (M Adinolfi, G Chieffi and M Siniscalco), 1325
Cygnus-A Radio Source Red-Shift Absorption Spectrum of the (Dr R D Davies and Dr R C Jennison), 803
Cypriot Woman (Turkish-) A Haemoglobin with Unusual Alkaline-denaturation Properties in a (Dr J E O'N Gillespie, Dr J C White, M J Ellis, Dr G H Beaven, W B Gratzer, Dr E M Shooter and R M E Parkhouse), 1876
Cysteine Protection against Radiation Cataract Possible Mechanism of (A Pirie and L G Lajtha), 1125
Cysticercus bovis Infection of Cattle with, by the Injection of Onchospheres (G Foyd and M C Round), 1510
Cystine labelled with Sulphur-35 Measurement of the Rate of Growth of Wool using (A M Downes and A G Lyne), 1884
Cystine (Selenium and) An Effect of, on Lipide Peroxidation in Tissues Deficient in Vitamin E (Dr John G Bieri), 1148
Cystine-Cysteine, Glutathione and Total Free Sulphydryl Contents of, in Arsenic-resistant and Sensitive Strains of the Blue Tick, *Boophilus decoloratus* (Dr J S Harington), 1739
Cystine Reductase (Triphosphopyridine Nucleotide-linked) A Reduced, in the Clothes Moth, *Tineola bisselliella* (Humm), (R F Powning and H Irzykiewicz), 1230
Cytidine Triphosphate Positive Inotropic Activity of (Winifred G Nayler and Marian McCulloch), 67
Cytochemical Detection of Polyaldehyde Moieties in Sections and Smears Fluorescent Schiff-Type Reagents for (Prof Frederick H Kasten, Vivian Burton and Peggy Glover), 1797
Cytochemical Study of Mitochondrial Structure (Prof C H Chopra), 656
Cytochrome b_5 Crystalline (Dr Isaias Raw and Walter Colli), 1798
  Methaemoglobin Reduction through (Nicola Petragnani, Otilia C Nogueira and Dr Isaias Raw), 1651
Cytochrome Oxidase Activity in the Sea Urchin Egg An Inhibitor of (Rachele Maggio and Alberto Monroy), 68
Cytochrome System of *Streptomyces* (Dr D J Niederpruem and Dr D P Hackett), 1954
Cytodifferentiation (edited by Dorothea Rudnick), (Developmental Biology Conference Series, 1956, under the auspices of the United States National Academy of Sciences—National Research Council), *review* by Dr D R Newth, 839
Cytological Identification of Proliferating Donor Cells in Chick Embryos injected with Adult Chicken Blood (P M Biggs and L N Payne), 1594
Cytology (published in the Russian language by the Academy of Sciences of the U S S R), 410
Cytology International, *review* by Prof J Bronte Gatenby, 574
  International Review of (edited by Prof G H Bourne and Prof J F Danielli), Vol 7, *review* by Prof J Bronte Gatenby, 574
Cytology of the Genus *Sanguisorba* (Kai Larsen), 743
Cytoplasm of Tumour-Cell Cultures in Contact with Lysozyme Appearance of Granules in the (Dr Carlo Callerio), 202, *erratum*, 508
Cytoplasmic Inheritance (Prof D G Catcheside), 1012
Cytoplasmic Nucleopeptides in Guinea Pig Liver (P Szafranski, E Sulkowski and T Golaszewski), 1940
Cytoplasmic Particles from Plant Tissue Cultures Oxidative and Phosphorylative Activities of (Taiki Tamaoki, Prof A C Hildebrandt, A J Riker, R H Burris and Bunji Hagihara), 1491
Cytosine Derivatives Photoautomerization of, on Ultra-violet Irradiation (Shih Yi Wang), 184
Czechoslovak Academy of Sciences Monographs and Source Material, Chemical Section, Vapour–Liquid Equilibrium (Eduard Hala, Jiří Pick, Vojtech Fried and Otakar Vilím), translated by G Standart, *review* by Dr R Sargent, 837

D REGION of the Ionosphere (B Bjelland, O Holt, B Landmark and F Lied), 973
Da Re, P , and others N-Substituted 7-Methoxy-8-Aminomethylchromones and Flavones—New Brain-Stem Stimulants, 362
Dadswell, Dr H E , and others Transport of Driftwood from South America to Tasmania and Macquarie Island, 203
Dagenais, Yves, and others Increased Circulating Insulin-like Activity in Obese-Hyperglycaemic Mice, 61
Dagger Nematode (*Xiphinema* sp) Role of a, in Outbreaks of Plant Diseases caused by Arabis Mosaic Virus (Dr B D Harrison and Dr C H Cadman), 1624
Dagger Nematodes associated with a Clover Sickness (F C Peacock) 123
'Dagmar' Microfilm Reader Microcard Adapter for (Trew Microfilming, Ltd), 941
Dagva, E The Mongolian Wild Horse, *Equus przewalskii*, 1024
Dahl, E Origin and Dispersal of Flowering Plants (Amphi-Atlantic Arctic-Alpine Plants), 1200
Daily Range of the Geomagnetic Vertical Intensity around the Magnetic Equator Possible Asymmetry in the (Dr C A Onwumechilli), 51
Dainton, A D , and others Coal Science (Carbonization—Effect of Macerals on Volume Changes in Briquettes during Carbonization), 413
Dairying, National Institute for Research in Annual Report for 1958, 770
  Grant of 89,348 dollars from the Population Council, Inc , New York, in support of researches on cervical mucus, with particular reference to the control of fertility, 1362
Dakin, T W , and Berg, Daniel Luminous Spots on Electrodes in Insulating Oil Gaps, 120

Detection of Thyroid Antibodies using Bentonite Particles (Dr J A M Ager, Dr M S R Hutt and G Smith), 478

Detection of Tritium in Tissue Low-Temperature Autoradiography for the, with Removal of Luminescence induced by Tritium (P Pellerin, P Fallot, M Laine-Boszormenyi and F Serrel), 1385

Detection (Cytochemical), of Polyaldehyde Moieties in Sections and Smears Fluorescent Schiff-Type Reagents for (Prof Frederick H Kasten, Vivian Burton and Peggy Glover), 1797

Detection and Identification of the Polyphenoloxidase Substrate of the Banana (Dr L A Griffiths), 58
Detector (Radioactive Ionization Type) Analysis of Permanent Gases by Gas Chromatography using a (V Willis), 894
Detectors (New) The Importance of, *review*, 1260
Detergent (Cationic) Interaction between Nucleic Acid and a (Prof Dino Guerritore and Luciano Bellelli), 1638
Detergent (Paraffin-) Interactions in Aqueous Systems Solid State Rheological Study of the Mechanism of (F J Radd and L H Crowder) 443
Determinants of Survival in Intraperitoneal Infections of Mice Opsonins as (Dr C R Jenkin and Prof D Rowley), 474
Determination of Chlorine in Muscle Tissues by Neutron Activation Analysis (Dr Jonas Bergstrom), 1504
Determination of Glucosamine Synthesis Interfering Substances in the (Dr Fiorenzo Paronetto), 1317
Determination of the Interaction of Deoxyribonucleate and Magnesium Ions by means of a Metal Ion Indicator (Joseph Shack and Barbara S Bynum), 635
Determination of ΔT from the Lunar Ephemeris and the Frequency of Caesium in Terms of U T $-\Delta T$ An Error in the (C A Murray), 441
Determination of Magnesium in Blood Serum by Atomic Absorption Spectroscopy (Dr J B Willis), 186
Determination of Suitable Buffer Systems for Countercurrent Distribution A Paper-Chromatographic Method for the (Andrzej Waksmundzki and Edward Soczewinski), 977
Determination of the Temperatures of Ancient Seas by the Measurement of the Oxygen Isotopes Ratio in Fossil Calcareous Organisms (Y A Birstein) 1025
Determination of Tissue Mucoproteins (Luiz A Abreu and R Raposo Abreu), 2016
Determination of Xanthine Oxidase Activity using the Oxygen Electrode A Rapid and Sensitive Method for the (Metry Bacila and Dr Gilberto G Villela), 1394
Determination (Age), in *Mansonioides* Mosquitoes (R H Wharton), 830
Determination (Age), in Wild Rabbits (R H Taylor), 1158
Determination (Colorimetric), of Elastin Some Improvements in (Dr V Scarselli), 1563
Determination (Electrical) of Transport of 3-Indole Acetic Acid in *Avena* (I A Newman) 1728
Determination (Polarographic), of Serine A Micromethod for the (J Ladik and Dr I Szekacs), 188
Determination (Quantitative) Occurrence and, of 2-Dimethylaminoethanol in Animal Tissue Extracts (Dr Conrad G Honegger and Ruth Honegger), 550, *erratum*, 1986
Determinations (Alkali Ion), by means of Glass Electrodes (Research Symposium at the University of Sheffield), 1616
Determining Carbon-14 by Combustion using Calcium Carbonate A Method for (E C S Little), 900
Determining the Fat Content of Algal Cells Value of a Simple Observational Technique for (Dr J H Evans), 1737
Determining Quality in Merino Wool Routine Methods for (P L le Roux) 917
Deuel, H Macromolecules (Inorganic and Organic/Inorganic Polymers), 1690
Deuterated Green Algae Chloroplast Pigments of (Harold H Strain, Henry L Crespi and Joseph J Katz), 730
Deuterium Oxide Culture of Algae and other Micro-organisms in (Henry L Crespi, Sylvia M Archer and Joseph J Katz), 729
    Effects of, on the Synthesis of *T*5 and *T*7 Bacteriophages (E L Rothstein, L A Manson, R Hartzell, jun , and David Kritchevsky), 1167
    Saliva-Serum Ratios of, after Administration of Heavy Water (Nan Taggart and Dr F E Hytten), 457
Deutsch, Dr K Coating of Red Blood Cells with Antigenic Substances, 278
Deutsche Bunsengesellschaft fur Physikalische Chemie and the Max-Planck Gesellschaft Colloquium on Fast Chemical Reactions in Solution, 1453
Deutsche Bunsengesellschaft fur Physikalische Chemie and the International Union of Pure and Applied Chemistry Symposium on Thermodynamics, 1606
Deutschen Gesellschaft fur Electronenmikroskopie Conference, 508
Developing Chicken Embryos Combined Effects of Cortisone and Insulin on (Dr Pietro de Franciscis and Prof Walter Landauer), 101
Developing Rat Brain Histochemical Study of Monoamine Oxidase in the (Nobuo Shimizu and Nogaaki Morikawa), 650
Development Antibacterial Substances of Coniferous Seedlings at Different Stages of their (R Vamos and L Vida), 915
    Colonial 680
    Haemoglobin Pattern of the Cyclostome *Pertromyzon planeri* during the Course of (M Adinolfi, G Chieffi and M Siniscalco), 1325
    Immunology and (edited by M V Edds, Jr), (Developmental Biology Conference Series, 1956 under the auspices of the United States National Academy of Sciences—National Research Council), *review* by Dr D R Newth, 839
    My Philosophical (Bertrand Russell), *review* by Prof R Braithwaite, 749
    Nuclear Power and its, 383
Development of the Aplacophorous Mollusc *Neomenia carinata* Tullberg (Dr T E Thompson) 122
Development of Bubble Chambers and some recent Bubble Chamber Results in Elementary Particle Physics (Dr D A Glaser), 954
Development of Connective Tissue Diaphragms for Analysing the (Prof Hans Selye), 701
Development of Even-Aged Plantations Pathogenic Factors in the Rooting Space and the (W R Day), B A 46
Development of Furnaces for Glass Melting (Dr W M Hampton), 772
Development of Iron and Steel Technology in China (Dr Joseph Needham), *review* by Prof F C Thompson, 1830
Development of Isolated Blastomeres of Mouse Eggs Experiments on the (Dr Andrzej K Tarkowski), 1286
Development of Nuclear Power, *review* by R Brightman, 1673
Development of Public Services in a Modern Democracy, 1087
Development of *Trypanosoma vivax* to the Infective Stage in Tsetse Fly Tissue Culture (Dr William Trager), B A 30
Development of the Yolk Nucleus in the Oocytes of some Fishes (Prof A Stolk), 1746
Development (Aeronautical Research and), Advisory Group for (Combustion and Propulsion Panel) Discussion on the Chemistry of Propellants, 778
    Discussion on Basic Problems in Propulsion, 779
Development (Executive) Sandwich Course in (Sheffield College of Technology), 235
Development (Foetal) Prevention of, by Enzyme Inhibition (Prof G Karlson and Elsa Rosengren), 1238
Development (*Gamma* Particles, Nadi-Positive Mitochondria, and), in the Water Fungi *Blastocladiella* and *Allomyces* (Prof Edward C Cantino and Gilbert Turian), 1889
Development (The Geological), of North America, *review* by Dr J W Cowie, 1600
Development (Limb), in the Absence of Ectodermal Ridge (Dr Eugene Bell, Dr John W Saunders, jun , and Dr Edgar Zwilling), 1736
Development (Management), a Systematic Approach to the Provision of Supervisors and Managers (F I de la P Garforth), 319
Development (Prenatal) Environmental Influences on (edited by Beatrice Mintz), (Developmental Biology Conference Series, 1956, under the auspices of the United States National Academy of Sciences—National Research Council), *review* by Dr D R Newth, 839
Development (Research and) Reviews of Data on No 13, Research and Development and Economic Growth (Dr A T Waterman), (United States National Science Foundation) 591
    Reviews of Data on, No 14, Funds for Research and Development Performance in American Industry (United States National Science Foundation) 1022
    Reviews of Data on, No 15, Grants for Private Philanthropic Foundations during 1957 (United States National Science Foundation), 1272
Development (Research and), at the Heston Laboratories of Atomic Power Constructions, Ltd , 517
Development Charges (Research and) in Civil Nuclear Power, 406
Development Commission Special Promotions, 859, 1273
Development Commission on Biological (Non-Medical) Problems of Nuclear Physics (Agricultural Research Council, the Medical Research Council and the) Appointment of Sir James Denby Roberts as chairman of the Joint Committee of the, 237
Development Commissioners' scheme Joint Meeting of the Challenger Society with representatives from the marine laboratories 410
Development Expenditure (Government Research and), in Britain Control of, 696
Development Performance in American Industry Funds for Research and (United States National Science Foundation, Reviews of Data on Research and Development No 14), 1022
Development Trends in Australian Scientific Research, 1027
Development and Economic Growth Research and (Dr A T Waterman), (United States National Science Foundation, Reviews of Data on Research and Development No 13), 591
Development and Growth of Cutaneous Melanoma in Killifish Hybrids Effect of Thiouracil and Thyroxine on (Prof A Stolk), 562
Developmental Biology, No 1, 236
Developmental Biology, *review* by Dr D R Newth, 839
Developmental Biology Conference Series, 1956—Cytodifferentiation (edited by Dorothea Rudnick) Environmental Influences on Prenatal Development (edited by Beatrice Mintz) Regeneration in Vertebrates (edited by Charles S Thornton) , Embryonic Nutrition (edited by Dorothea Rudnick) , Immunology and Development (edited by M V Edds, Jr) , Dynamics of Proliferating Tissues (edited by Dorothy Price) , Wound Healing and Tissue Repair (edited by W Bradford Patterson), (United States National Academy of Sciences—National Research Council), *review* by Dr D R Newth, 839
Developments in Thermodynamics (Dr H A Skinner, K Schafer and J S Rowlinson), 1606
Developments (Economic), in the Middle East, 1957-1958 (Supplement to World Economic Survey, 1958) (United Nations), 1280
Developments (New), in Training—Five Studies in the Efficient Communication of Skills (edited by Frank A Heller) 421
Developments (Newer) in the Chemistry of the Non-Metals (Kingston Technical College Course of Lectures on), 1915
Developments (Recent), in Textile Chemistry (Bradford Institute of Technology, the Bradford Chemical Society and the Yorkshire Council for Further Education Symposium on) 1845
Developments (Scientific) Mass Media of Communication and, 659
Developments (Scientific) in Britain, 1190
Developments and Trends in Palaeontology Recent (Prof O M B Bulman), B A 42
Deviation of Zone Lenses produced by Polarization (Prof Jurgen R Meyer-Arendt), 811
Devices (Semiconductor) Transistors and Associated (Electronics and Communications Section of the Institution of Electrical Engineers International Convention on), 693
Devreux, M , et autres Recherches sur l'Autostérilite du Caféier robusta (*Coffea canephora* Pierre) 518
Dewar Prof M J S Nitration of Hydrocarbons and other Organic Compounds *review*, 577
    Aromatic Substitutions, *review*, 925
Dewdney, D A C Opening Address at the Symposium at Queen Mary College on the Oxidation of Organic Compounds, 326
Dewhirst, Dr D W (Blackwell Dr D E , and) Kellogg and Ney's Model of the Solar Corona 1120
Dexter, Dr D Appointed reader in morbid anatomy at St George's Hospital Medical School, London, 322
Dextran Release of Histamine from Rat Mast Cells by Blood treated with (Dr G T Archer), 1151
Dextran in Human Red Cells after Haemolysis Accumulation of (N V B Marsden and S G Ostling), 723
Dextran (Injected) Labelled with Tritium in Mice Fate of (Å Hanngren, E Hansson, S Ullberg and Prof B Åberg), 373
Dextran-producing Cultures of *Streptococcus bovis* Formation of Leucrose in (R W Bailey and Prof E J Bourne), 904
Dextransucrase Kinetic Study of, based on the Langmuir Adsorption Isotherm (W Brock Neely and C F Thompson), B A 64
Dhar, Dr N R Nitrogen Replenishment in the Soil (Presidential Address to the Indian Society of Soil Science), 942

Dherte, Dr Paulette, and others Haemoglobin *P* in a Family in the Belgian Congo, 1133
Dhont, J (Weurman, C, and) Unexpected Formation of Volatile Compounds on Gas–Liquid Chromatography Columns, 1480
Di Sabato, Dr G Effect of Reduced Diphosphopyridine Nucleotide on the Swelling of Isolated Mitochondria, *erratum*, 95
Di- and Tri-phosphate (Adenosine) Concentrations Changes in, in the Early Stages of the Action of Yeast on Glucose (Dr J O Laws and Dr L H Stickland), 1246
Diabetic Rats (Normal and) Release of Non-Esterified Fatty Acids from Adipose Tissue in (Dr E Wendeova and Dr J Pav), 1147
N,O-Diacetylneuraminic Acid and *N*-Acetylneuraminic Acid in *Escherichia coli* (Dr C W De Witt and J A Rowe), 381
Diadema setosum (Leske) Isolation of Echinochrome *A* from the Spines of the Sea Urchin (Kokichi Nishibori), 1234
Diagnosis, Improvement and Management of Salt-affected Soils (Unesco Middle East Science Co-operation Office Regional Training Course on), 1778
Diagrams (Constitutional), of Uranium and Thorium Alloys (Frank A Rough and Arthur A Bauer), *review* by Dr R E D Hughes, 925
Diagrams (Polar), of Birds Radar Echoing Area (J Edwards and E W Houghton), 1059
Dialysable (A Non-) Inhibitor of Glutamo-Transferase present in Excised Tomato Roots (C S Vaidyanathan and Prof H E Street), 347
Diamagnetic Anisotropy in Crystals Intermolecular Distances and, as Measures of the Polarity of Benzene and Borazole Substituents (Dame Kathleen Lonsdale), 1060
Diamantes de Angola, Companhia de Museu fo Dundo, Publicacoes Culturais No 37, Flagrantes da Vida na Lunda (Introducao de Dr José Osorio de Oliveira), 236
Diamine (Ethylene) Evidence of Side-Chain Cleavage during the Reaction of Epinephrine and Norepinephrine with (Dr Louis-P Joly and Dr Guy Nadeau), 1483
Diamine Tetra-acetate (Ethylene) Effect of, on Vitamin B_{12} Absorption in the Rat (Edward G Rice, Dr Samuel M Greenberg, John F Herndon and E J Van Loon), 1948
Diaminopimelic Acid Release of Compounds containing, from *Vibrio metchnikovi* treated with Antibody and Complement (Dr F Shafa and Dr M R J Salton), 1341
Diamond Intensity of the (111) Reflexion for (Prof R Brill and H Barth), 264
  Preparation of (Dr H P Bovenkerk, Dr F P Bundy, Dr H T Hall, Dr H M Strong and Dr R H Wentorf, jun), 1094
Diamond (Natural and Synthetic) Spiral and other Growth Forms of Synthetic Diamonds—a Distinction between (Prof S Tolansky and Dr I Sunagawa), 1526
Diamond (Semiconducting), after Heat Treatment Electrical Resistivity Changes observed in a (R E Mutch and Dr F A Raal), 1857
Diamonds (Synthetic) Spiral and other Growth Forms of—a Distinction between Natural and Synthetic Diamond (Prof S Tolansky and Dr I Sunagawa), 1526
Diapause Dormancy of the Khapra Beetle—Quiescence or (H D Burges), 1741
Diapause in the European Corn Borer, *Ostrinia nubilalis* (Hbn) (Lepidoptera Pyralidae) Chemical Changes associated with (J A Mutchmor and J H Maruzek), 1077
Diaphragm (Rat) Salicylate and Potassium Fluxes of (Dr J A Hicklin), 2029
Diaphragm (Rat), *in vitro* Role of Magnesium in the Insulin-Sensitivity of the (Dr Gangagobinda Bhattacharya), 1401
Diaphragm Muscle (Rat) Monosaccharide Transport in (F C Battaglia and P J Randle), 1713
Diaphragms for Analysing the Development of Connective Tissue (Prof Hans Selye), 701
Diatom from the Antarctic An Unusual (E J Ferguson Wood), 1962
Diazotization Measurement of Inhibition by Azide in Biochemical Assay Systems involving Nitrite Estimation by (Dr E J Hewitt and D G Hallas), 1485
Diazotization Procedures used in Biological Assay Systems Interference by Azide with (J R Villanueva), 549
2 5-Dicarbethoxy-3 4-Dihydroxy-Thiophene Inhibition of Tumour Growth with (Dr M B Sahasrabudhe, M V Narurkar, L B Kotnis, B D Tilak and M D Bhavsar), 201
Dickens, F Enzymes (Regulation of Enzymic Reactions within the Cell), 688
Dickins, Dr B G Promoted to Chief Scientific Officer and appointed director general of atomic weapons in the Ministry of Supply, 232 , work of, 232
Dickinson Memorial Lecture (Second Biennial), to the Newcomen Society, 1956 (Dr Joseph Needham), *review* by Prof F C Thompson, 1830
Dickson, A D, and others Production of Emetic Material by Species of *Fusarium*, 1319
Dickson, Prof J G, and others Production of Emetic Material by Species of *Fusarium*, 1319
Dictionary of Metallurgy (Dr A D Merriman), *review* by Prof F C Thompson, 1765
Die-Back in Yellow Lupins High Levels of Phosphorus and (R G Warren and B Benzian), 1588
Dieldrin Mechanisms of Resistance of Adult Houseflies to the Insecticide (F P W Winteringham and A Harrison), 608
  Resistance of Houseflies to γ-Benzene Hexachloride and (R G Bridges and J T Cox), 1740
Dielectric Absorption in Dispersed Systems (G A Johnson and Dr S A Neale), 898
Dielectric Studies on Deoxyribonucleic Acid (H G Jerrard and B A W Simmons), 1715
Dielectrics, *review* by Dr V Daniel, 1175
Dielectrics Progress in (edited by Dr J B Birks and Dr J H Schulman), Vol I, *review* by Dr V Daniel, 1175
Dierick, W, and others Influence of X-Rays on the Activity of Carbonic Anhydrase in Erythrocytes and on their Haemolytic Resistance, 111
Diet Effect of, on the Blood Sugar and Liver Glycogen Level of Normal and Adrenalectomized Mice (B P Block and Dr G S Cox), 721
Diet in Aminoaciduria caused by Maleic Acid Significance of Lactose in the (Stefan Angielski and Jerzy Rogulski), 276
Diet containing Roughage Experimental Production of Magnesium Deficiency in Lambs on a (Dr D M McAleese and Dr R M Forbes), 2025
Diet (Clover-free) Implications of Restricting Cows to a, in order to Reduce the Strontium Content of Milk (Dr David Purves), 1408
Diet (Human) Strontium-90 in, in the United Kingdom (Agricultural Research Council), 1111
Dietary Factors in the Homograft Reaction (Dr A S Parkes), 699
Dietary Fat and Extent of Blood Sampling Effect of, on the Level of Plasma Cholesterol in the Rat (I Coleman and J M R Beveridge), 1041
Dietary Protein and Serum Cholesterol in Rats (A P de Groot), 903
Dietary Protein Percentage Influence of, on Growth of Wool (K A Ferguson), 907
Dietrich, Prof G Polar Front Survey—Hydrography (Greenland and Norwegian Seas), 1181 , (Shetland–Faroe–Iceland Region), 1182 , (North Atlantic Ocean), 1182
Difference between the Catalases of Acid-fast Bacilli (Wieslaw Tysarowski and Stanislaw Kwiek), 1513
Difference in Heat Tolerance Exhibited by *Bos taurus* and *Bos indicus* Beef Cattle A Possible Explanation for Part of the (H P Ledger), 1405
Difference between Lattice Constants of Copper dipyridine dichloride and dibromide Influence of the Size of the Halogen Atom on the (Vladimir Kupcik and Slavomil Durovic), 1060
Difference (Sex), in Ethanol Tolerance of Rats (Henrik Wallgren), 726
Difference (Sex), in the White Blood Cells of Rats (*WR* Strain), (Dr Hans Meier), 1082
Different Ages Enzymes and Radioactivity in Erythrocytes of (Dr Lester M Levy Harry Walter and Martin D Sass), 643
Different Cell–Virus Relationships Formation of, in Tumour Cells induced by Polyoma (Dr Leo Sachs and Ernest Winocour), 1702
Different Heating Rates Number of Free Radicals in Coal during Carbonization at (J Smidt and Prof D W van Krevelen), 719
Different Size Classes in Non-diabetic Humans of Varying Ages Actual Distribution of the Number and Volume of the Islets of Langerhans in (Bo Hellman), 1498
Different Stable *L* Forms of *Proteus P* 18 Distribution of Nucleic Acids among (Prof P Mandel, M Sensenbrenner, P De Gregorio and A M Bader), 566
Different Stages of their Development Antibacterial Substances of Coniferous Seedlings at (R Vamos and L Vida), 915
Different Tissues and Subcellular Fractions Distribution of Enzyme Systems responsible for Steroid Metabolism in (Virandra B Mahesh and Frank Ulrich), 1147
Different Wild-Type Isoalleles Effect of, on Crossing-over in *Drosophila melanogaster* (M M Green), 294
Differential Analysis of the Effects of Phenothiazine-Tranquillizers on Emotional and Motor Behaviour in Experimental Animals (Dr M Taeschler and Dr A Cerletti) 823
Differential Equations Ordinary (Dr Wilfred Kaplan), *review* by Prof T A A Broadbent, 6
Differential Equations for Instrumentation Engineers, *review* by Prof T A A Broadbent, 6
Differential Equations (Partial) Numerical Analysis and (George E Forsythe and Paul C Rosenbloom), *review* by Prof T A A Broadbent, 576
Differential and Interference Distances of Chiasmata Simultaneous Change in both (Dr J Yanney Wilson), 207
Differentiation between a Growth-Promoting Factor and a Tumour-Susceptibility Factor in Eggs (Charles H Hill and Henry W Garren), 824
Differentiation (Liquation), in Magma (V I Lebedinsky), 1025
Differing Biological and Physical Properties Turnip Yellow Mosaic Virus Nucleoprotein Particles with (R E F Matthews), 530
Difficulties in the Present Systems of Superannuation, 503
Diffraction (X-Ray), by Carbons Effects of Heating on (Eitaro Matuyama), 544
Diffraction Pattern (Electron) Structure of Precipitated Cadmium Sulphide as studied by Single-Crystal (Dr Ryoitiro Sato), 2005
Diffraction Pattern (X-Ray), of Carbide in Low-Carbon Iron-Silicon Alloys (G Konoval, L Zwell, L A Gorman and W C Leslie), 1862
Diffuse in Nervous Action The Discrete and the (James Arthur Lecture on the Evolution of the Human Brain), (Prof D P C Lloyd), 1777
Diffusion of Exchangeable Cations in Vermiculite (G F Walker), 1392
Diffusion of a New Habit among Greenfinches (Dr Max Pettersson), 649
Diffusion (Agar) Estimation of Vitamin C by (Alan H Chaiet and Louis Chaiet), 1487
Diffusion ('Eddy'), in Chromatography (J Calvin Giddings), 357
Diffusion (Intergranular), in a Silicate System Measurement of—Iron in Forsterite (Prof John J Naughton and Yasuo Fujikawa), B A 54
Digest of Soviet Technology, No I (Engineering Information Services, Ltd), 320
Digital Computers (British Council Course on) 1450
Digitalinum Verum (16-Acetyl) Chemistry and Pharmacology of (Z Kanda, Prof A Sekiya, K Katayama, A Okano and T Miki), 1414
1,4-Dihydrazinophthalazine Effects of, on Organ Content and Adrenal Medullary Secretion of Catechol Amines (M Bydgeman and L Stjarne), 1646
Dihydro- and Tetrahydro-1-naphthoic Acids (5- and 8- Halogeno) Plant Growth Activities of (Toshio Fujita, Sadao Imai, Koichi Koshimizu, Tetsuo Mitsui and Jiro Kato), 1415
Dihydrostreptomycin Interaction of Streptomycin and, with Apo- and Co-dehydrogenases (Prof K Michalska), 987
Dijksterhuis, Prof E J History of Cosmology, *review*, 836
$\alpha\epsilon$-Diketopimelic Acid Synthesis of Dipicolinic Acid from (the late Joan F Powell and R E Strange), 878
Diluents (Organic) Effect of Emulsifiers and, in Soil Insecticide and Nematicide Formulations (F T Phillips), 1512
Dilute Binary Solid Solutions of Bismuth in Tellurium and Tellurium in Bismuth Some Semiconductive Properties of (Dr Tomasz R Piwkowski), 355
Dimbat, M, and others Carrier Gas and Sensitivity in Gas Chromatography, B A 54
6,7-Dimethoxy*iso*quinoline-1-aldoxime Berberine Alkaloids via (Dr C K Bradsher and Dr N L Datta), 1943
2-Dimethylaminoethanol in Animal Tissue Extracts Occurrence and Quantitative Determination of (Dr Conrad G Honegger and Ruth Honegger), 550, *erratum*, 1986

1,3-Dimethylthymine Ultra-violet Irradiation of (Shih Yi Wang), B A 59
Dimorphism and Size Distribution in *Velella* and *Physalia* (Prof Robert Bieri), 1333
Dineley, Dr D L Appointed lecturer in geology at the University of Bristol, 1613
Dingle, Prof H Scientific Research and the Philosophy of Science, 1193
Dingman, Prof Joseph F (Arimura, Akira, and) Specific and Sensitive Assay Method for Vasopressin and Oxytocin using Glass-Paper Chromatography, 1874
Dinitrophenol Need for Inorganic Phosphate in Oxidations stimulated by (P Borst and Prof E C Slater), 1396
2 4-Dinitrophenyl Amino-Acids Detection of, on Paper Chromatograms (Dr A H Maddy), 1397
Dinucleotide (Flavin Adenine) Binding of the Sulphydryl Group in D-Amino-Acid Oxidase Apo-Protein with (Dr Kunio Yagi and Takayuki Ozawa), 1227
    Change of Absorption Spectrum of, by its Binding with both D-Amino Acid Oxidase Apo-Protein and Benzoate (Dr Kunio Yagi, Takayuki Ozawa and Minoru Harada), 1938
Dioctyl Sodium Sulphosuccinate Registration of the Spermicidal Effects of (Prof Per Eric Lindahl and Kjell Wedin), 1289
Dioxide (Carbon) Vibrational Relaxation and Dissociation of, behind Shock Waves (Dr I R Hurle and Dr A G Gaydon), 1858
Dioxide (Carbon), in Water in Wine in Beer and in other Beverages (F Justin Miller), *review* by Dr A H Cook, 302
Dioxide (Hydrogen, Carbon), and Air Habit of Ice Crystals grown in, at Reduced Pressure (A P van den Heuvel and Dr B J Mason) 519
Dioxide (Carbon) Output of Individual Insects The Infra-Red Gas Analyser as a Means of Measuring the (Dr A G Hamilton), 367
Dioxide (Carbon-14) Experiments with Hydrocortisone Liver Glucosyl Oligosaccharides and Glycogen— (Dr Hsien-Gieh Sie, Prof James Ashmore, Dr Robert Mahler and Prof William H Fishman), 1380
Dioxide (Manganese) Action of, on Simple Carbohydrates (Dr J L Bose, Dr A B Foster, Prof M Stacey and Dr J M Webber), 1301
Dioxide (Sulphur) Inhalation Influence of, on the Phagocytic Activity of the Macrophage System (Prof D L J Bilbey and Dr H Salem), 722
Dioxide (Titanium) Pigment Particles Forces between (James E Latty and Dr W C Clark), 49
Diphosphopyridine Nucleotide Effect of Reduced, on the Swelling of Isolated Mitochondria (Dr G Di Sabato), *erratum*, 95
Diphosphopyridine Nucleotide from Nicotinamide Synthesis of, by Slices of Liver (C J Threlfall), 60
Diphosphopyridine Nucleotide Oxidation Inhibition of Reduced, by Ammonia (R T Wedding and H M Vines), 1226
Diphtheric Intoxication (Experimental) Effect of Tranquillizing Drugs on Survival from (Prof Leo Greenberg and Dr James W Ingalls), 1721
Dipicolinic Acid Synthesis of, from *αε*-Diketopimelic Acid (the late Joan F Powell and R E Strange), 878
Dipterocarpaceae Chemistry and Taxonomy in the (Dr E C Bate-Smith and Dr T C Whitmore), 795
Dipyridyl Quaternary Salts Redox Properties of some (R F Homer and T E Tomlinson), 2012
Direct Continuous-Wave Reflexion Apparent Observation of Solar Corpuscular Clouds by (Dr. John D Klaus and W Reed Crone), 965
d c Stabilization of Transistor Circuits Use of the Silicon Resistor in the (J T Zakrzewski and D H Mehrtens), 811
Direct Effect of Erythropoietin on Human Erythroid Cells *in vitro* Lack of (Edward L Alpen, L G Lajtha and Donald C Van Dyke), 1228
Direct Spectroscopic Examination of Electrophoretic Zones in Agar Gel (Dr G H Beaven and W B Gratzer), 359
Directional Observations of Radio Noise from the Outer Atmosphere (G R A Ellis and D G Cartwright), 1307
Directional Sensitivity A Functional Interpretation of the Electron-Microscopic Structure of the Sensory Hairs in the Cristae of the Elasmobranch *Raja clavata* in Terms of (Prof O Lowenstein and J Wersall), 1807
Directory of Nuclear Reactors (International Atomic Energy Agency), Vol I, Power Reactors, *review* by Dr A J Salmon, 1438
Disappearance from the Blood of Promethium-147 in Rats Hormone Effects on Early Distribution and (Dr Bergene Kawin), 1816
Disappearance of the Erythropoietic Factor from Plasma of Anaemic Dogs after Nephrectomy (Dr Jean-Pierre Naets) 371
Disaster Food for Survival after a (Dr R C Hutchinson), *review* by M W Grant, 841
Discarded Blood Bank Blood as a Source of Protein for Cultivation of HeLa Cells (Billy R Blakey and Prof George E Gifford), 1158
Discharge (Corona) Light from the (Dr R W E Cook), 1055
Discharges (Cosmical Electrical) The Temperature required for Nuclear Reactions in (Dr C E R Bruce), 2004
Discharges (Electrical) Insulating Particles on Cathode Surfaces—their Effect upon (L B Griffiths and P C L Pfeil), 1475
Discipline of the Scientific Method, 295
Discoloration (Tallowy), in Cheddar Cheese—Fat Oxidation and Trace Metals in Cheddar Cheese (F Bishop), 1295 Fat Oxidation and Haematin Systems in Cheese (C G Rammell), 1296
Discontinuity (Mohorovičic) etc Depth of Isostatic Compensation and, in Continental and Oceanic Areas (J N Nanda), 629
Discontinuity (Weld Structure) Crack Behaviour at a (F J Radd), 543
Discovery Patterns of (Prof Norwood Russell Hanson), *review* by Gerd Buchdahl, 572
Discrete and the Diffuse in Nervous Action (James Arthur Lecture on the Evolution of the Human Brain), (Prof D P C Lloyd), 1777
Discrimination between Ebb and Flood Tide in Migrating Elvers (*Anguilla vulgaris* Turt) by means of Olfactory Perception (F Creutzberg), 1961
Discrimination of Xylose from Arabinose and some other Sugars (B Drozdz), 1395
Disease (Chagas's) International Congress on (Dr J D Fulton), 1114
Disease (Foot-and-Mouth) Effect of Proflavine on the Formation of the Virus of, and its Infective Ribonucleic Acid in Pig Kidney Tissue Culture Monolayers (F Brown and Doreen L Stewart), B A 74
Disease (A Suspected Virus), of the Citrus Red Mite *Panonychus citri* (McG), (Dr Kenneth M Smith, G J Hills, F Munger and J E Gilmore), 70
Disease (A Virus), of *Meloidogyne incognita incognita*, the Southern Root Knot Nematode (J R Loewenberg, T Sullivan and M L Schuster), 1896
Disease of Mice (Tyzzer's) Pure Culture of the Pathogenic Agent of (Dr K Kanazawa and A Imai), 1810
Diseases Biological Problems arising from the Control of Pests and (Institute of Biology Symposium on), 1100
Diseases in Agricultural and Horticultural Crops The Control of Pests and (G L Hey and K Marshall), *review* by F C Bawden, 1258
Diseases (Plant), caused by Arabis Mosaic Virus Role of a Dagger Nematode (*Xiphinema* sp) in Outbreaks of (Dr B D Harrison and Dr C H Cadman), 1624
Diseases (Thalassaemia) Genetic Basis of the (Prof V M Ingram and A O W Stretton), 1903
Diseases and Pests of Farm Crops Recognition of (Ernst Gram, Prosper Bovien and Chr Stapel), *review* by F C Bawden, 1258
Disitzer, L V , and others Electrophoretic Heterogeneity of Trypsin, 1225
Dislocation Arrangements in Molybdenum (J F Kerridge, A A Johnson and H I Matthews), 356
Disney, H J de S , and others Duration of the Regeneration Period of the Internal Reproductive Rhythm in a Xerophilous Equatorial Bird, *Quelea quelea*, 1659
Disorder Essential Pentosuria—Renal or Enzymic (Dr R C Bozian and Prof Oscar Touster), 463
Disorganization of the Secondary Structure in Proteins exposed to Ionizing Radiations in the Solid State (Dr Peter Alexander, L D G Hamilton and Dr K A Stacey), 226
Dispersal of Flowering Plants Origin and (Prof A S Boughey), 1200
Dispersed Sodium Ultrasonically (M W T Pratt and R Helsby), 1694
Dispersed Systems Dielectric Absorption in (G A Johnson and Dr S A Neale) 898
Disposal of Radioactive Waste (K Saddington and W L Templeton), *review*, 301
Disposal (River Pollution Sewage), and Trade Waste Treatment (Department of Civil Engineering and the Department of Extra-Mural Studies in the University of Birmingham Course on), 1451
Dispute (Printing) *Nature* and the Recent, 919
Dissimilation (Oxidative), of *p*-Aminobenzoic Acid by *p*-Aminosalicylic Acid Antagonism of the (Prof Norman N Durham and Jerry S Hubbard) 1398
Dissociation of Carbon Dioxide behind Shock Waves Vibrational Relaxation and (Dr I R Hurle and Dr A G Gaydon), 1858
Dissociation of the 'Surface Membrane Complex' in Atrophic Muscle Fibres (Dr R Birks, Prof B Katz and Dr R Miledi), 1507
Distances (Differential and Interference), of Chiasmata Simultaneous Change in both (Dr J Yanney Wilson), 207
Distances (Immunological), among some Gallinaecous Birds (Danilo Mainardi), 913
Distances (Intermolecular), and Diamagnetic Anisotropy in Crystals as Measures of the Polarity of Benzene and Borazole Substituents (Dame Kathleen Lonsdale), 1060
Distemper Virus (Canine) in Tissue Culture An Attenuated Strain of (Prof Gunnar Rockborn), 822
Distension (Localized), of the Oesophagus in Decerebrate Sheep Responses to (Prof A F Sellers and Dr D A Titchen), 645
Distilled Water 'Deminrolit Plants for (Permutit Co , Ltd), 25
Distinct Sectors in Polymer Single Crystals Evidence for (D C Bassett, Prof F C Frank and Dr A Keller), 810
Distinction between Natural and Synthetic Diamond Spiral and other Growth Forms of Synthetic Diamonds—a (Prof S Tolansky and Dr I Sunagawa), 1526
Distinction (Serological), of Adult and Foetal Human Haemoglobin (G R E Naylor and M E Adair), 1854
Distinguishable Coins (Partially) Heads-Tails Statistics for Two (Gabriel Weinreich), 1825
Distinguishing Bovine Type Tubercle Bacilli from other *Mycobacteria* Nicotinamidase in *Mycobacteria*—a Method for (Dr Kiyoshi Konno, Dr Hideo Nagayama and Dr Sutemi Oka), 1743
Distinguishing between α- and β-Glycosides by the use of Plant Haemagglutinins (Lectins) A Method for (Dr O Makela), 111
Distribution Relict Faura of Ennerdale Water—a Problem of (Dr W Pennington), 1421
Distribution of Ascorbic Acid in the Leaves of some Plants (Dr Philippe Hagene), 284
Distribution of British Books and Films Overseas, 1448
Distribution of 5-Carboxymethylhydantoinase (Dr Lloyd H Smith, jun , Faith A Baker, Margaret Sullivan and Lawrence J Kunz), 1314
Distribution of Enzyme Systems responsible for Steroid Metabolism in Different Tissues and Subcellular Fractions (Virendra B Mahesh and Frank Ulrich), 1147
Distribution of Flares on the Solar Disk Associated with Noise (L R McNarry) 806
Distribution of Hydrogen Structure of Bituminous Coals—Evidence from (Dr P H Given), 980
Distribution in the Mouse of Lethal and Sub-Lethal Doses of Cottonmouth Moccasin Venom labelled with Iodine-131 (Prof J F Gennaro, jun , and H W Ramsey), 1244
Distribution of Nucleic Acids among Different Stable *L* Forms of *Proteus P* 18 (Prof P Mandel, M Sensenbrenner, P De Gregorio and A M Bader), 566
Distribution of Promethium Plasma Fractions in Rats (Dr Bergene Kawin), 1722
Distribution of Protein Synthesis Effect of Protein Depletion on the, (Dr John Waterlow), 1875
Distribution of Radioactive Barium in Eye Tissues (R J Garner), 733
Distribution of Scientific Publications in Under-developed Countries (Scientific Publications Council Discussion on), B A 22
Distribution of Sodium in Compact Bone, as revealed by Autoradiography of Neutron-activated Sections (Prof J Vincent), 1332
Distribution (Actual), of the Number and Volume of the Islets of Langerhans in Different Size Classes in Non-diabetic Humans of Varying Ages (Bo Hellman), 1498
Distribution (Chromium), around Grain Boundary Carbides found in Austenitic Stainless Steel (B E Hopkinson and K G Carroll), 1479
Distribution (Countercurrent) A Paper-Chromatographic Method for the Determination of Suitable Buffer Systems for (Andrzej Waksmundzki and Edward Soczewinski), 977

Distribution (Counter-Current), of Proteins in Aqueous Polymer Phase Systems (Per-Ake Ålbertsson and Ed Jacques Nyns), 1465, *erratum*, 1688
Distribution (Early), and Disappearance from the Blood of Promethium-147 in Rats Hormone Effects on (Dr Bergene Kawin), 1816
Distribution (Size), in *Velella* and *Physalia* Dimorphism and (Prof Robert Bieri), 1333
Distribution (World), of Atmospheric Water Vapour Pressure (G A Tunnell), B A 15
Disturbance in the Ionospheric F-Region following the Johnston Island Nuclear Explosion (C H Cummack and G A M King) B A 32
Disturbance (Geomagnetic) Correlation between Earth-Current and (V P Hessler and E M Wescott), 627
  Diurnal Variation of Aurora and, at New Zealand Antarctic Stations (Dr T Hatherton and G G Midwinter), 889
Disturbance (Geomagnetic), and Velocity of Slow-Drift Solar Radio Bursts (M B Wood and C S Warwick), 1471
Disturbances (Giant Travelling), and Sporadic *E* Ionization A Relation between (L H Heisler), 1788
Disturbances (Interfacial) in Gas–Liquid Systems Droplet Circulation and (Dr C Ramshaw and Dr J D Thornton) 719
Disturbed Days Geomagnetic Activity at Halley Bay on (J MacDowall), 1543
Dithiocarbamates of the Coinage Metals (Cu, Ag Au) Electron Spin Resonance and Divalency of some (Tore Vanngard and Stig Åkerstrom), 183
Dithiourethane Splenic Siderosis in Mice treated with (Prof P N Cowen), 366
Diuretic Activity Sulphonamides with (Dr W Logemann, Dr P N Giraldi and Dr M A Parenti), 1711
Diurnal Variation of Aurora and Geomagnetic Disturbance at New Zealand Antarctic Stations (Dr T Hatherton and G G Midwinter), 889
Diurnal and Nocturnal Conditions Changes in the Lacunal Parencyma of *Mimosa pudica* in (Hideo Toriyama), 737
Divalency Electron Spin Resonance and, of some Dithiocarbamates of the Coinage Metals (Cu, Ag, Au), (Tore Vanngard and Stig Åkerstrom), 183
Diverse Morphological Forms in *Convolvulus pluricaulis* Chois Intraspecific Polyploidy and Evolution of (Dr S L Tandon and C P Mzalik), 481
Diversion of Saliva from the Actively Fermenting Rumen of Sheep Relationship between *p*H and Volatile Fatty Acid and (W R McManus), 1572
Divorce Statistics in Britain, 1107
Divorce Statistics Marriage and (Demographic Yearbook 1958, Special Topic), (United Nations), *review*, 1525
Dixon, Dr D Nuclear Forces and the Few-Nucleon Problem (Photonuclear Reactions with Light Nuclei), 1113
Dixon, Dr Malcolm Enzymes in the Food Industry, 1366
Dixon, Dr Malcolm, and Webb, Dr Edwin C Non-Inverted versus Inverted Plots in Enzyme Kinetics, 1298
Doak, S (Koller, P C, and) Biological Effects of Low Doses of Ionizing Radiations (Immunological Aspects of Tissue Transplantation after 300 r of X-Rays), 1113
Dobryszycka, W, and others Regeneration of Protein from Insoluble Protein-Tannin Compounds, 1799
Documentation Service A New Geological, 153
Documents Newtonian, *review* by Dr M A Hoskin, 1750
Dodd, Dr J M, and others Force-Feeding Fish under Experimental Conditions, 1660
Dodd, Dr M H I, and others Force-Feeding Fish under Experimental Conditions, 1660
Dodgson, K S (Lloyd, Dr A G, and) Infra-Red Spectra of Carbohydrate Sulphate Esters, 548
Does an Increase in the Tension in a Ligament elicit Reflex Muscular Responses ? (Dr Bertil Stener), 1495
Dog (Anaesthetized) 'Supercarbia' in the (Dr G R Graham, D W Hill and J F Nunn), 1071
Dogs (Anaemic), after Nephrectomy Disappearance of the Erythropoietic Factor from Plasma of (Dr Jean-Pierre Naets), 371
Dolder, K Thermonuclear Research (Shock Waves in Gases), 1017
Dole, Prof M, and Williams, Dr T F Energy Transfer with special reference to Biological Systems (Disappearance of Unsaturated Linkages on γ-Irradiation of Polyethylene), 689
Dole, S H, and Margolis, M A Chemistry of Propellants (Sources, Availability and Estimated Cost of Propellants), 778
Dolerite Intrusions from the Theron Mountains and Whichaway Nunataks, Antarctica Palaeomagnetism of some (D J Blundell and P J Stephenson), 1860
Dolezilova, L, and others An Electron-Microscopic Study of Spores of Morphological Variants of *Streptomyces erythreus* Strains, 1888
Doll, Dr R, and others Dose–Response Relationship in Radiation Leukaemia, 1669
Dolman, Prof Claude E, and others Statement on Biological and Chemical Warfare, 1018
Domb, Prof C Fluctuation Phenomena and Stochastic Processes, 509
Domestic Animals Reproduction in (edited by H H Cole and P T Cupps), Vol 1, *review* by Dr S J Folley, 1091
Domination (Photopositive), in a Scolytid Beetle Release by Exercise Flight of a Chemotropic Response from (Prof Kenneth Graham), 283
Domingo, V and others Two Cases of Triple Fission of Uranium-235, 1057
Donaldson, P E K Electronic Apparatus for Biological Research, *review* by W J Perkins, B A 4
Donaldson, P E K (Barlow, Dr H B, and) Awarded a grant of £1,000 by the Paul Instrument Fund Committee of the Royal Society, 507
Donaldson, W F, and others Coal Science (Ultra-fine Structure of Coals and Chars), 413
Donhoffer, Prof Sz and others Thermo-regulatory Heat Production in the Brain, 993
Donnay, Prof J D H Twinning of Crystals (A Crystal Twins whenever there is a Superlattice that has more Symmetry than the Actual Lattice of the Crystal), 1911
Donor Cells (Proliferating), in Chick Embryos injected with Adult Chicken Blood Cytological Identification of (P M Biggs and L N Payne), 1594
Donors (406 French Blood) Frequencies of the Haptoglobin Groups in (Dr J Moullec and Dr J M Fine), 196
Dorf, E Origin and Dispersal of Flowering Plants (Angiosperms in various Tertiary Floras of Wyoming), 1201
Dormancy of the Khapra Beetle—Quiescence or Diapause (H D Burges), 1741
Dormancy (Extended), of Deciduous Woody Plants treated in Autumn with Gibberellic Acid (Dr P W Brian, J H P Petty and P T Richmond), 69
Dormancy (Seed) Prevention of the Onset of, by Gibberellic Acid (Dr M Black and J M Naylor), 468, *erratum*, 857
Dorsal Aorta of certain Fishes A Ligament in the (Dr L L de Kock and Dr S Symmons), 194
Dorsal Tegmental Nuclei A Heat-Loss Mechanism involving the Habenular, Interpeduncular and (B G Cragg), 1724
Dorst, T At the 139th Annual Meeting of the Swiss Society for Natural Sciences (La Signification des Galapagos pour l'Etude de l'Évolution), 1454
Dose Fractionation An Effect of, on the Incidence of Bone Tumours using Radioactive Phosphorus (Dr N M Blackett) 565
Dose–Response Relationship in Radiation Leukaemia (Dr P Armitage, Dr W M Court Brown and Dr R Doll), 1669, (Dr D J Mewissen) 1670
Doses (Lethal and Sub-Lethal), of Cottonmouth Moccasin Venom labelled with Iodine-131 Distribution in the Mouse of (Prof J F Gennaro, jun, and H W Ramsey), 1244
Doses (Low), of Ionizing Radiations Biological Effects of (Unesco, the International Atomic Energy Agency and the Comitato Nazionale per le Richerche Nucleari Symposium on), 1111
Dosimeter (A Sensitive Chemical), for Ionizing Radiation (Prof Gerald Oster and Dr Barret Broyde) 545
Dossett, H A (edited by G Sell and) Handbook of the Petroleum Industry, *review*, 1832
Doudney, C O Macromolecular Synthesis in Bacterial Recovery from Ultra-violet Light, 189
Doudney, C O, and Haas F L Effect of Purine and Pyrimidine Analogues on Reversion of a Tryptophan-requiring Strain of *Escherichia coli*, 114
Dougherty, Dr Ellsworth C, and others Photoreactive Pigments in Flagellates—Chromoprotein Pigments of some Cryptomonad Flagellates, 1047
Douglas, Dr A S The British Computer Society—First Conference, 945
Douglas, Prof R W The Structure of Glass *review*, 134
Dounreay Fast Breeder Reactor Criticality of the, 1449
Dowben, Dr Robert M Prolonged Survival of Dystrophic Mice treated with 17α-Ethyl-19-Nortestosterone, 1966
Dowden, R L Low-Frequency (100 kc /s) Radio Noise from the Aurora, 803
Dowdeswell, W H Practical Animal Ecology, *review* by Prof J B Cragg, 1262
'Dowex-I' (Resin,) Chemical Activities of *E coli* adsorbed on a (Tsutomu Hattori and Choseki Furusaka), 1566
Downes, A M, and Lyne, A G Measurement of the Rate of Growth of Wool using Cystine labelled with Sulphur-35, 1884
Downstream Migration Retinal Responses of Pink Salmon associated with its (Dr M A Ali and Prof W S Hoar), 106
Dragon Project of the Organization for European Economic Co-operation, 24, 942
Drake, J M F, and others Energy Transfer with special reference to Biological Systems (Chelates of Iron as Models for the Understanding of the Variations in Spectrum and Redox Potential of the Cytochromes), 690
Drakeley, Dr T J (edited by) Annual Report on the Progress of Rubber Technology (Institution of the Rubber Industry), 854
Dresskamp, H (Burton, Prof M, and) Energy Transfer with special reference to Biological Systems (Measurement of Luminescence Decay Times in Scintillator Systems) 689
  Fast Chemical Reactions in Solution (Direct Measurement of Energy Transfer Processes), 1454
Drenth, J, and Jansonius, J N The Unit Cell of Mercuripapain Crystals, 1718
Driftwood Transport of, from South America to Tasmania and Macquarie Island (Prof H N Barber, Dr H E Dadswell and H D Ingle), 203
Driver Behaviour A Simulator for Research on (Prof J H Mathewson), 237
Droplet Circulation and Interfacial Disturbances in Gas–Liquid Systems (Dr C Ramshaw and Dr J D Thornton), 719
Droplets (Water) Supercooling of (P G Fox), 546
Dropping Mercury Electrode Reduction of the $FeS_2O_3^+$ Ion at the (F M Page), 1481
Drosophila and other Flies Plastron Respiration in the Eggs of (Dr H E Hinton), 280
Drosophila melanogaster Complementation among the Sub-Genic Mutants in the *r*-Locus of (Dr O G Fahmy and Dr Myrtle J Fahmy), 1927
  In vitro Cultivation of Blood Cells of, in a Synthetic Medium (Dr Masakatsu Horikawa and Dr Yukiaki Kuroda), 2017
  Effect of Different Wild-Type Isoalleles on Crossing-over in (M M Green), 294
  Genetic Control of Tryptophan Peroxidase-Oxidase in (Corrado Baglioni), 1084
Drosophila (Adult) Synthesis of Deoxyribonucleic Acid in (Per Oftedal), 1961
Drozdz, B Discrimination of Xylose from Arabinose and some other Sugars, 1395
Drug (Anti-coagulant), Pelentane or Thromexane Isomeric O-Methyl Ethers of Ethyl di-(4-hydroxycoumarinyl-3)-Acetate, the (Dr Eduard Knobloch), 1568
Drug-Metabolizing Enzymes Stimulatory Effect of Foreign Compounds on Ascorbic Acid Biosynthesis and on (Dr A H Conney and Dr J J Burns), 363
Drugs Man-made, *review* by F R Batchelor, 1597
Drugs (Ganglion Blocking) Action of, on Choline Acetylase (Dr J E Gardiner), B A 71
Drugs (Synthetic) Chemistry of (May's), revised and rewritten by Dr G Malcolm Dyson, in consultation with Dr Percy May, fifth edition, *review* by F R Batchelor, 1597
Drugs (Tranquillizing) Effect of, on Survival from Experimental Diphtheric Intoxication (Prof Leo Greenberg and Dr James W Ingalls), 1721

rummond, the late Sir Jack, and Wilbraham, Anne The Englishman's Food, revised by Dorothy Hollingsworth, *review* by Dr Leslie J Harris, 484
Dry and Wet Conditions Effect of X-Radiation on the Survival of Yeast in (A Mookerjee), 1502
Dryden, Dr I G C Coal Science 412
Drying Survival of Spermatozoa following (Dr Harold T Meryman and Emanuel Kafig), 470
D'Silva, Prof J L Appointed to the Halliburton chair of physiology in King's College, London, 322, 405 , work of, 405
Du Bois, Dr P M Palaeomagnetism and Rotation of Newfoundland, B A 63
du Plessis, C Appointed director of the International Red Locust Control Service, 590 , work of, 590
du Pont Company of America Grant of 3,000 dollars to the University of Oxford, for the support of basic research in the field of theoretical chemistry, 1688, 1986

Effect of Acetylcholine on the Incorporation of Radiophosphorus into the Phosphatido-Peptide Fraction of Pancreas Slices (Prof C G Huggins), 1412

Effect of Acetylcholine and Eserine on the Spawning of *Hydractinia echinata* (M Yoshida), 1151

Effect of Added Substances on the Rate of Reductive Photo-bleaching (Reductive Photo-bleaching of Eosine), (Kengo Uchida, Shunji Kato and Masao Koizumi), 1620

Effect of Adrenalectomy on the Hormone Content of the Thymus in the Rat (Dr J Comsa), 279

Effect of 'Amino-Acid Imbalance' on Growth and Vitamin A Storage in the White Rat (M Rechcigl, jun , S Berger, J K Loosli and H H Williams), 1404

Effect of Atomic Tests on Radio Noise (C A Samson), 538

Effect of Bacillus Calmette-Guerin Infection on Transplanted Tumours in the Mouse (Dr Lloyd J Old, Dr Donald A Clarke and Dr Baruj Benacerraf), 291

Effect of Cell-Free Extracts from *Mycobacterium tuberculosis* $H_{37}Rv$ on Lung Succinooxidase (Dr A Bekierkunst and M Artman), 458

Effect of Chlorpromazine on Crocker Sarcoma and Ehrlich Ascites Carcinoma (Prof M Chorazy), 200

Effect of Chlorpromazine upon Isolated *d*-Amino-Acid Oxidase Systems (Dr Andrew Lasslo and Anne L Meyer), 1922

Effect of Cobaltic Oxide Pellets on the Vitamin B_{12} Content of Ewes' Milk (L I Hart and E D Andrews), 1242

Effect of Concentrated Urea Solutions on the Infectivity and Haemagglutinin of Vaccinia Virus (Prof J F McCrea and Jean O'Loughlin), 1497

Effect of Diet on the Blood Sugar and Liver Glycogen Level of Normal and Adrenalectomized Mice (B P Block and Dr G S Cox) 721

Effect of Dietary Fat and Extent of Blood Sampling on the Level of Plasma Cholesterol in the Rat (I Coleman and J M R Beveridge) 1041

Effect of Different Wild-Type Isoalleles on Crossing-over in *Drosophila melanogaster* (M M Green) 294

Effect of Dose Fractionation on the Incidence of Bone Tumours using Radioactive Phosphorus (Dr N M Blackett), 565

Effect upon Electrical Discharges Insulating Particles on Cathode Surfaces—their (L B Griffiths and P C L Pfeil), 1475

Effect of Emulsifiers and Organic Diluents in Soil Insecticide and Nematicide Formulations (F T Phillips), 1512

Effect of Ethylenediamine Tetra-acetate on Vitamin B_{12} Absorption in the Rat (Edward G Rice, Dr Samuel M Greenberg, John F Herndon and E J Van Loon), 1948

Effect of Flavins on Cramp caused by Phenol (Prof Kunio Yagi, Dr Hirofumi Yagi and Dr Ikuko Nagatsu), 1648

Effect of Gamma-Radiation on the Synthesis of Methanol over Zinc Oxide (T I Barry and R Roberts), 1061

Effect of Gibberellic Acid on the Initiation of Flowers and Runners in the Strawberry (P A Thompson and C G Guttridge), B A 72

Effect of Gibberellin on the Growth of Pollen Tubes (Nanda Bose), 1577

Effect on the Groundnut of Variations in Supply of Potassium, Calcium and Magnesium (Dr R Comber), 1003

Effect of Hybridization Changes on the Bond Energies of Carbon–Carbon Single Bonds (J E Bloor and S Gartside), 1313

Effect of Indole Acetic Acid and α-Naphthalene Acetic Acid on the Growth, Flowering and Fruit Set in Sweet Potato (G Satyanarayana and Dr G Rangaswami), B A 73

Effect of Insecticides on the Bodies of Nissl and Neurofibrillae of the Locust, *Schistocerca gregaria* (Dr Tohamy A Moussa and M Banhawy), 915

Effect of Iron and Zinc on Nucleic Acid and Protein Synthesis in *Mycobacterium smegmatis* (Frank Winder and Joan M Denneny), 742

Effect of Jet Aircraft Noise on Hearing (Surg -Lieut R R A Coles and J J Knight), 1803

Effect of the Level of Microbial Population on Isotopically Exchangeable Phosphate in Soil (Dr P Newbould and Dr R L Lucas), 1155
Effect of some Neuromuscular Blocking Agents on Mitochondrial Enzyme Systems (Dr J H Koch and Dr C H Gallagher), 1039
Effect of Nitrous Acid on Tobacco Mosaic Virus—Mutation or Selection? (F C Bawden), B A 27
Effect of Oxygen on Endogenous Metabolism of a Respiratory-deficient Brewer's Yeast (V E Chester), 1956
Effect of Oxygen Tension on Haem and Porphyrin Biosynthesis (J E Falk, R J Porra and Anne Brown, and F Moss and Helen E Larminie), 1217
Effect of Pempidine on the *in vitro* Synthesis of Acetylcholine (Joan Parkinson), 554
Effect of Photoperiod on the Gonadal Cycle in an Equatorial Bird, *Quelea quelea* (Dr Albert Wolfson and David P Winchester), 1658
Effect of Polycyclic Aromatic Hydrocarbons on the Polarographic Maximum of Copper (C E Searle), 1716
Effect of Polyphloretin Phosphate on the Suspension Stability of Red Blood Corpuscles (Dr Bengt Fries), 62
Effect of the Potassium Salt of Gibberellic Acid on the Growth and Reproduction Rate of *Paramecium multimicronucleatum* (A A Oravec, N G Strovilas, J L Beal and Arthur Tye), 1405
Effect of Proflavine on the Formation of the Virus of Foot-and-Mouth Disease and its Infective Ribonucleic Acid in Pig Kidney Tissue Culture Monolayers (F Brown and Doreen L Stewart), B A 74
Effect of Prolonged Thyroid Administration on Aged Male Rats (Prof John F Lhotka Lloyd Glenn McArthur and Arthur A Hellbaum), 1149
Effect of Protein Depletion on the Distribution of Protein Synthesis (Dr John Waterlow), 1875
Effect of Purine and Pyrimidine Analogues on Reversion of a Tryptophan-requiring Strain of *Escherichia coli* (C O Doudney and F L Haas) 114
Effect of Reduced Diphosphopyridine Nucleotide on the Swelling of Isolated Mitochondria (Dr G Di Sabato), *erratum*, 95
Effect of *Rhizobium* Polysaccharide on the Formation of Polygalacturonase in Lucerne and Clover (H Ljunggren and G Fahraeus) 1578
Effect of Selenium and Cystine on Lipide Peroxidation in Tissues Deficient in Vitamin E (Dr John G Bieri), 1148
Effect of Sexual Maturation and Castration on the Sex Chromatin Pattern in the Male Rat (St Zsifkovits, Ch Mehes and C Jobst), 1239
Effect of a Signal Contingent upon an Avoidance Response (Prof J D Keehn and Sanniyah Nakkash), 566
Effect of Sorbitol on the Urinary Excretion of some B Vitamins in Man (J D Watson and Prof John Yudkin), 911, *errata*, 1362
Effect of Steroids and related Compounds on the Growth of Dermatophytes (Dr F W Chattaway, J D Townsley and A J E Barlow), 1731
Effect of Sulphanilamide on Citric Acid Production by *Aspergillus niger* (K V Rajagopalan, R Radhakrishnamurthy and P S Sarma), 461
Effect of Sulphonamides on the Phagocytic Activity of the Reticulo-Endothelial System (Prof T Nicol and I A Sewell), 1241
Effect of Temperature on the Rate of Setting of Gypsum Plaster (M J Ridge), 47
Effect of Thioctic Acid on Gain in Body-Weight by Turkey Poults (J R Jowsey, R M Blakeley and H J MacGregor), 1323
Effect of Thiouracil and Thyroxine on Development and Growth of Cutaneous Melanoma in Killifish Hybrids (Prof A Stolk), 562
Effect of Tranquillizing Drugs on Survival from Experimental Diphtheric Intoxication (Prof Leo Greenberg and Dr James W Ingalls), 1721
Effect of Ultrasound on the Protein of Human Serum Denatured with Tannin (Dr Wizold Mizgalski and Irena Zygmunt), 1486
Effect of Ultra-Violet Irradiation on Transduction in *Pseudomonas aeruginosa* (J S Loutit), 1960
Effect of Vitamin D on the Respiration of Rat Oral Tissue (L Zar and Prof J T Irving), 1410
Effect of Whole-body X-Irradiation on the Insulin Resistance of Fasted Rats (Dr V Stankovic and N Sestan) 1816
Effect of X-Radiation on the Survival of Yeast in Dry and Wet Conditions (A Mookerjee) 1502
Effect (Acousto-Electric) Experiments on the (Piroska Smith (*née* Vermes) and D O Sproule), 264
Effect (Antidiuretic) of Vasopressin Mechanism of the (Dr Tsutomu Kashiwagi) 991
Effect (Chemical) of Ethylene during the Storage of Peas (Prof Frank A Lee), 462
Effect (Chemical) of Gene Mutation Human Haemoglobin *E*—the (Abnormal Human Haemoglobins), (Dr J A Hunt and Dr V M Ingram), 870
Effect (Curative) of Selenium upon the Incisor Teeth of Rats deficient in Vitamin E (Prof J T Irving), 645
Effect (Direct), of Erythropoeitin on Human Erythroid Cells *in vitro* Lack of (Edward L Alpen, L G Lajtha and Donald C Van Dyke), 1228
Effect (Inhibiting), of Iproniazid on the Depletion of Adrenal Catechol Amines induced by Reserpine Abolition by Chlorpromazine of the (F Camanni, Dr G M Molinatti and M Olivetti), B A 65
Effect (Inhibitory), of Fungistatic Antibiotics on the Production of Amylase by *Penicillium chrysogenum* (Dr I Horvath and A Szentirmai), 57
Effect (Peripheral), of the Bromide Ion on the Contraction of Striated Muscle (Dr D K de Jongh and H A Linnewiel), 1240
Effect (Promoting), of Urea on the *in vitro* Passive Sensitization of Isolated Plain Muscles with Precipitating Antibody (R Binaghi, Dr B N Halpern, P Liacopoulos and T Neveu), 1805
Effect (Protective), of Foreign Bone Marrow in Lethally X-Irradiated Mice Abrogation by Injected Mouse Blood of (L J Cole and R M Garver), 1815
Effect (Stimulatory), of Foreign Compounds on Ascorbic Acid Biosynthesis and on Drug-Metabolizing Enzymes (Dr A H Conney and Dr J J Burns), 363
Effect (Thomson) Influence of the, on the θ-φ Relationship for a Constrictive Resistance in Thermal Equilibrium (Dr W Davies), 975
Effective Increase in Nematode Populations by the Addition of Aureomycin (C O R Everard and William A Feder), 1887
Effective Viscosity Sedimentation and (Prof G J Kynch), 1311
Effects of Auxin and Gibberellic Acid on Growth of *Ulothrix* (Dr Herbert Conrad, Dr Paul Saltman and Dr Richard Eppley), 556
Effects of Carbon Tetrachloride on Kidney and Liver Function in the Sheep (Dr B P Setchell), 1242
Effects of Deuterium Oxide on the Synthesis of *T5* and *T7* Bacteriophages (E L Rothstein, L A Manson, R Hartzell, jun , and David Kritchevsky), 1167
Effects of 1,4-Dihydrazinophthalazine on Organ Content and Adrenal Medullary Secretion of Catechol Amines (M Bygdeman and L Stjärne), 1646
Effects of Elevated Plasma Sodium Concentration on Sodium and Potassium in the Erythrocyte of the Lizard *Trachysaurus rugosus* (Gray), (P J Bentley), 1403
Effects of the Energy of Strong Pulses of Ionic Current on Micro-organisms in Suspension (B S Gossling), 1881
Effects of Forest Areas on Water Resources, and the Technique of Lysimetry—Water and Woodlands (Dr L Leyton), 1184 , Lysimeters (F W Green), 1186
Effects of Gibberellic Acid on Juvenility in *Marsilea* and certain other Plants (Dr A Allsopp), 1575
Effects of Heating on X-Ray Diffraction by Carbons (Eitaro Matuyama), 544
Effects of Irradiation of Nerve on Muscular Response (A Portela, D Brandes, Prof G H Bourne, Marion Hines, P Stewart and B L Redd, jun), 734
Effects of Methylthiouracil or Thyroidectomy on Activation of Pituitary Acid Phosphatases *in vitro* by Whole Hypothalamic Extract (Dr V Schreiber and Dr V Kmentova), 728
Effects of Phenothiazine-Tranquillizers on Emotional and Motor Behaviour in Experimental Animals Differential Analysis of the (Dr M Taeschler and Dr A Cerletti), 823
Effects of Piston Mass and Bursting Pressure on the Motion of a Piston in a Hypersonic Gun Tunnel Measurement of the (B J Belcher), 1207
Effects of Printing Types and Formats on the Comprehension of Scientific Journals (E C Poulton), 1824
Effects of Reserpine on Secretion from the Denervated Adrenal Medulla (L Stjarne and S Schapiro), 2023
Effects of Substituted Phenoxy-Compounds and other Translocated Herbicides on the Rhizome of Bracken (Dr Elsie Conway and J A Forrest), 1416
Effects of 2-Substituted Thiadiazoles Reversal of, by Nicotinamide Analogues and Precursors (Dr Irwin H Krakoff, Corrine R Lacon and Dr David A Karnofsky), 1805
Effects of the Water Hyacinth (*Eichornia crassipes*) in the Nile Valley (H R J Davies), 1085
Effects (Biological) Incorporation of 5-Bromouracil into Transforming Principle of *Bacillus subtilis* and its (Dr Erela Ephrati-Elizur and Prof Stephen Zamenhof), 472
Effects (Biological), of Low Doses of Ionizing Radiations (Unesco, the International Atomic Energy Agency and the Comitato Nazionale per le Ricerche Nucleari Symposium on), 1111
Effects (Collision), in Atomic Spectra (W R Hindmarsh), 155
Effects (Combined), of Cortisone and Insulin on Developing Chicken Embryos (Dr Pietro de Franciscis and Prof Walter Landauer), 101
Effects (Comparative), of Heat on Chromatography and Ultra-violet Absorption of Deoxyribo- or Ribo-Nucleic Acids (Dr Saul Kit), 36
Effects (Field), on Chemisorbed Films in Electron Emission Microscopy (R J Hill and P W M Jacobs), 895
Effects (Genetical), of Population Subdivision (P A P Moran), 505
Effects (Geophysical), of High-Altitude Nuclear Explosions (W A Feibelman), 442
Effects (Hormone), on Early Distribution and Disappearance from the Blood of Promethium-147 in Rats (Dr Bergene Kawin), 1816
Effects (Immediate and Low-level), of Ionizing Radiations (Dr Tikvah Alper), 1111
Effects (Insecticidal), of Activated Charcoal and Clays (S K Majumder, K S Narasimhan and V Subrahmanyan), 1165
Effects (Magnetic), resulting from Two High-Altitude Nuclear Explosions (J A Lawrie, V B Gerard and P J Gill), B A 34
Effects (Pathophysiological), of Circulating Ferritin (Yoshio Oki), 1944
Effects (Pharmacological), of Staphylolysin on the Isolated Rat Uterus Some (Dr B Wiegershausen), 2017
Effects (Polarization and Resolving Time), in Photon Correlation (Dr E Brannen and Prof W Wehlau), 263
Effects (Prophylactic), of Amine Oxides in Radiation Injury in Mice (Dr Thomas J Haley, Dr Anna M Flesher and Dr Nathan Komesu), 198
Effects (Solar), in the Motion of *Vanguard* (Dr Stanley P Wyatt), 351
Effects (Spermicidal), of Dioctyl Sodium Sulphosuccinate Registration of the (Prof Per Eric Lindahl and Kjell Wedin), 1289
Effects (Steric), in Conjugated Systems—Proceedings of a Symposium held at the University, Hull, 1958, by the Chemical Society (edited by Dr G W Gray), *review* by Dr G Eglinton 1522
Effects (Steric), in Organic Molecules, *review* by Dr G Eglinton, 1522
Effects (Structural), of Kinetic Heating (Royal Aeronautical Society Discussion on), 30
Efficiency of the Mitochondrial Oxidative Phosphorylations in Intact Ascites Tumour Cells (Dr P Emmelot and C J Bos), 2024
Efficiency (Lowered Bactericidal), of Hydrogen Peroxide on Milk from Cows treated with Penicillin (J Babad, D L Boros and F Baier), 292
Efficiency and Separating Power of Packed and Capillary Gas Chromatographic Columns Comparison of (Dr J H Purnell), 2009
Efficient Communication of Skills New Developments in Training—Five Studies in the (edited by Frank A Heller), 421
Efficient Use of Man-power in Industry (Report of an inquiry by the National Joint Advisory Council), 25
Efford, Ian Rediscovery of *Bathynella chappuisi* Delachaux in Britain, 558
Egami, Prof Fugio, and others Formation of Streptolysin *S* by Streptococcal Protoplasts, 832
Egerton, Sir Alfred *Obituary* by Dr A G Gaydon, 678
Egg (Sea Urchin) An Inhibitor of Cytochrome Oxidase Activity in the (Rachele Maggio and Alberto Monroy), 68
Egg Laying in Tingidae (Hemiptera) Mode of (T S Thontadarya and G P Channa Basavanna), 289
Egg-White Allergy in the Rat Influence of the Thymus upon the (J Comsa), 1726
Eggeling, W J Conservation in the Scottish Highlands (The Effect of Conservation Practices on Animal Distribution), 1529
Eggs Differentiation between a Growth-Promoting Factor and a Tumour-Susceptibility Factor in (Charles H Hill and Henry W Garren), 824

INDEX

Eggs of *Drosophila* and other Flies Plastron Respiration in the (Dr H E Hinton), 280
Eggs of the Polypodiaceous Ferns Deoxyribonucleic Acid in (Dr P R Bell), 1664
Eggs (Embryonated), and Unsusceptible Cell Lines Infectivity of Polio Virus Ribonucleic Acid for (P De Somer, Dr A Prinzie and E Schonne), 652
Eggs (Giant), of the Clover Cyst Nematode, *Heterodera trifolii* Goffart, 1932 (Roland H Mulvey), 1662
Eggs (Grasshopper), kept for Long Periods in Mineral Oil Survival of (Prof Eleanor H Slifer), 1424
Eggs (Mouse) Experiments on the Development of Isolated Blastomeres of (Dr Andrzej K Tarkowski), 1286
Eggs (Prediapause), of *Aedes* Mosquitoes Control of Hatching in the (Dr J D Gillett), 1621
Eggvin, Dr J Polar Front Survey (Hydrography—Temperature Salinity and Current Charts for the Norwegian and Greenland Seas), 1181
Eglinton, Dr G Steric Effects in Organic Molecules, *review*, 1522
  Use of Isotopes in Organic Syntheses, *review*, 1830
Egypt *In vitro* Study of the Anthelminthic Property of *Artemesia monosperma* grown in (A Sharaf, Z F Ahmed and F Abdel Moneim), 647
Egypt and Greece in Medical History, *review* by Dr Douglas Guthrie, 662
Egyptian and Cnidian Medicine Ancient (Robert O Steuer and J B de C M Saunders), *review* by Dr Douglas Guthrie, 662
Ehretsmann, J H, and Seymour, R C Coal Science (Gaseous Products and Thermochemistry of the Formation and Decomposition of Surface Oxides on Charcoals), 414
Ehrlich Ascites Carcinoma Effect of Chlorpromazine on Crocker Sarcoma and (Prof M Chorazy), 200
Ehrlich Ascites Tumour Ribonucleases of Mouse Tissues and of the (K A O Ellem, J S Colter and Jeanne Kuhn) 984
Ehrlich's Reagent Colour Reactions of certain Phenols with (Dr Cornelius Steelink), 720
Eichornia crassipes (Water Hyacinth) Effects of the, in the Nile Valley (H R J Davies), 1085
Eigen, Dr M East Chemical Reactions in Solution (Relaxation Methods), 1453
Eighteenth Century Chemistry in the (Dr Andrew Kent), 1452
Eighteenth Century Bird Paintings in the Library of Sir Joseph Banks (1743-1820) Some (Averil Lysaght), 941
Eimeria tenella Protein Synthesis in Macrophages containing (Dr G A Gresham and J G Cruickshank), 1153
Einarsson, Dr H Polar Front Survey (Biology—Zooplankton collected with Hardy Indicators in the Irminger Sea), 1183
Eire Agricultural Research in—An Foras Taluntais (The Agricultural Institute), 28
  Appointment of Dr T Walsh as director, 29
  Appointment of Dr L B O'Moore as chief of the Animal Production Division, 29
  Appointment of J J Byrne as chief of the Rural Economy Division, 29
Ekert, B, and Monier R Structure of Thymine Hydroperoxide produced by X-Irradiation, B A 58
Elasmobranch *Raja clavata* A Functional Interpretation of the Electron-Microscopic Structure of the Sensory Hairs in the Cristae of the, in Terms of Directional Sensitivity (Prof O Lowenstein and J Wersall), 1807
Elastin Some Improvements in Colorimetric Determination of (Dr V Scarselli), 1563
Electric Arc in Welding (Third 'Joining of Metals' Conference at the University of Birmingham,) 1030
Electric Field (Crystalline), in Cobalt Acetate Tetrahydrate Temperature Variation of the Principal Magnetic Moments of Co^{++} Ions and the Asymmetry of the (Dr Bhagawati Charan Guha), 50
Electrical Activity in the Muscle Cells of *Ascaris lumbricoides* (Dr M Jarman), 1244
Electrical Determination of Transport of 3-Indole Acetic Acid in *Avena* (I A Newman), 1728
Electrical Discharges Insulating Particles on Cathode Surfaces—their Effect upon (L B Griffiths and P C L Pfeil), 1475
Electrical Discharges (Cosmical) The Temperature required for Nuclear Reactions in (Dr C E R Bruce), 2004
Electrical Engineering Modern Network Theory in (University of Birmingham Conference on), 1691
Electrical Engineering at Newcastle-upon-Tyne, 404
Electrical Engineering at Southampton, 590
Electrical Engineering in the University of Western Australia, 93
Electrical Engineers, Institution of Election of Officers, B A 16
  Christmas Holiday Lecture, Colour Television (G G Gouriet), 1535
Electrical Engineers, Institution of, and the British Nuclear Energy Conference Convention on Thermonuclear Processes, 240
Electrical Engineers, Institution of (Electronics and Communications Section) International Convention on Transistors and Associated Semiconductor Devices, 693
  International Transistor Exhibition, 693
Electrical Engineers, Institution of (Electronics and Communications Section), and the International Federation for Medical Electronics Third International Conference on Medical Electronics, 1535
Electrical Research Association Thirty-eighth Annual Report (1958), 1538
Electrical Resistivity Changes observed in a Semiconducting Diamond after Heat Treatment (R E Mutch and Dr F A Raal), 1857
Electrical and Allied Industries Research Association, British (Prof J Greig), 1538
Electricity Basic—a Course of Training developed for the United States Navy by Van Valkenburgh, Nooger and Neville, Inc , adapted to British and Commonwealth Usage by a special Electronics Training Investigation Team of the Royal Electrical and Mechanical Engineers, *review* by G R Noakes, 133
Electricity Generating Board, Central Grant of £3,860 to the University of Leeds, for research on the utilization of pulverized fuel ash, 1534
Electrode (Dropping Mercury) Reduction of the $Fe_2SO_3^+$ Ion at the (F M Page), 1481
Electrode (Mercury) Influence of Gold in a, on certain Electrode Processes (Prof Wiktor Kemula, Zenon Kublik and Zbigniew Galus), B A 56
  Influence of Platinum in Mercury on the Mechanism of Electrode Reactions at the (Prof Wiktor Kemula, Zenon Kublik and Zbigniew Galus), 1795
Electrode (Oxygen) A Rapid and Sensitive Method for the Determination of Xanthine Oxidase Activity using the (Metry Bacila and Dr Gilberto G Villela), 1394
Electrode Processes Influence of Gold in a Mercury Electrode on certain (Prof Wiktor Kemula, Zenon Kublik and Zbigniew Galus), B A 56
Electrode Reactions at the Mercury Electrode Influence of Platinum in Mercury on the Mechanism of (Prof Wiktor Kemula, Zenon Kublik and Zbigniew Galus), 1795
Electrodes Luminous Spots on, in Insulating Oil Gaps (T W Dakin and Daniel Berg), 120
Electrodes (Glass) Alkali Ion Determinations by means of (Research Symposium at the University of Sheffield), 1616
Electrodes (Glass Micro-), for Measuring Intracellular Activities of Sodium and Potassium (Dr J A M Hinke), 1257
Electrodynamics Cosmic (Dr J W Dungey), *review* by Prof V C A Ferraro, 1672
Electrodynamics (Quantum) Experimental Tests of (Prof W E Lamb), 954
Electrolysis Hydrogenolysis of Carbon-Oxygen Bonds in some Aromatic Compounds by (Dr P H Given and Dr M E Peover), 1064
  Principles of (Prof C W Davies), *review* by Dr V Gold, 1902
Electron Bombardment Heating by (A Calverley) 690
Electron Bombardment Floating-zone Melting and Allied Electron Bombardment Techniques (Services Electronics Research Laboratory Symposium on), 690
Electron Bombardment Techniques Electron Bombardment Floating-zone Melting and allied (Services Electronics Laboratory Symposium on), 690
Electron Density-Height Profiles Conversion of Ionospheric Virtual Height-Frequency Curves to (Dr J O Thomas and M D Vickers), (Radio Research Board, Special Report No 28), 1024
Electron Diffraction Pattern (Single-Crystal) Structure of Precipitated Cadmium Sulphide as studied by (Dr Ryoitiro Sato), 2005
Electron Emission Microscopy Field Effects on Chemisorbed Films in (R J Hill and P W M Jacobs), 895
Electron Impact Isomerization to the Tropylium Ion induced by, and its Significance (Dr W Hanuš) 1796
Electron Mass Ratio of Nucleon Mass and (Prof A J Rutgers), 894
Electron Microscope Wall-chart of the Metro-Vickers *EM6* (Metropolitan-Vickers Electrical Co Ltd), 237
Electron-Microscopic Structure of the Sensory Hairs in the Cristae of the Elasmobranch *Raja clavata* A Functional Interpretation of the, in Terms of Directional Sensitivity (Prof O Lowenstein and J Wersall), 1807
Electron-Microscopic Study of Spores of Morphological Variants of *Streptomyces erythreus* Strains (L Dolezilova, Z Vanek and A Kralik), 1888
Electron Microscopical Structure of the Wall of Small Blood Vessels in Human Multiform Glioblastoma (Dr S H M Nystrom), 65
Electron Microscopy An Embedding Resin Miscible with Water for (Dr I R Gibbons), 375
  The Shape of Protein Molecules suggested by (Dr R C Valentine), 1838
Electron Microscopy of Autoradiographed Radioactive Particles (L A George, II, and G S Vogt), 1474
Electron Microscopy of Viruses Recent Work on the (Dr Kenneth M Smith), 1440
Electron Paramagnetic Resonance at 4 2°K of γ-Irradiated Polymethyl Methacrylate and Polymethacrylic Acid (Dr Derick W Ovenall), 181
Electron–Phonon Interaction in Solids (Physical Society Conference on), 1613
Electron Physics Advances in Electronics and (edited by L Marton, assisted by Claire Marton) Vol 10, *review* by J R Tillman, 1601
Electron Physics and Technology (Dr J Thomson and E B Callick), *review* by Dr D A Bell, 83
Electron Spin Resonance Free Radicals as Studied by (Dr D J E Ingram), *review* by Dr T M Sugden, 1259
  Free Radicals in X-Rayed Seeds of High and Low Water Content, as Measured by (Dr W Klingmuller, Dr G R Lane, M C Saxena and Dr D J E Ingram), 464
Electron Spin Resonance Investigations of *Allium cepa* and *Calliphora vomitoria* (M Edwards, Dr G A Kerkut, K A Munday, Dr D J E Ingram, M C Saxena and K Leach), 1402
Electron Spin Resonance and Divalency of some Dithiocarbamates of the Coinage Metals (Cu Ag Au), (Tore Vanngard and Stig Åkerstrom), 183
Electron Technology, *review* by Dr D A Bell, 83
Electron, Proton and Neutron A Comparison of the Charges of the (A M Hillas and T E Cranshaw), 892 , (Prof H Dondi and Dr R A Lyttleton), 974
Electronegativity of the Adjacent Atoms in some Aliphatic Carbonyl Compounds A Correlation between the Shift in the Ultra-Violet Absorption Maxima and the (Dr P Borrell), 1932
Electronic Achievements British 943
Electronic Apparatus for Biological Research (P E K Donaldson), *review* by W J Perkins, B A 4
Electronic Computer Experimental Music—Composition with an (Prof L A Hiller, Jr , and Leonard M Isaacson), *review* by Prof E G Richardson, 1754
Electronic Computers Music and, *review* by Prof E G Richardson, 1754
Electronic Engineering Association (Radio Industry Council and the) Premiums for articles on Electronics, 943
Electronic Excitation Transfer Mechanisms of (Prof Th Forster), 688
Electronic Prediction of Swarming in Bees (E F Woods), 842
Electronics Introductory *review* by Prof D G Tucker, 751
  Junction Transistor (Richard B Hurley), *review* by J W R Griffiths, 838
  Medical (Electronics and Communications Section of the Institution of Electrical Engineers and the International Federation for Medical Electronics Third International Conference on), 1535
  Premiums for articles on (Radio Industry Council and the Electronic Engineering Association), 943
  Principles of (Prof M R Gavin and Dr J E Houldin) *review* by Prof D G Tucker, 751
  Sixth National Symposium on Reliability and Quality Control in, 1362
  Transistor, *review* by J W R Griffiths, 838
  Transistor (Arthur W Lo Richard O Endres, Jakob Zawels, Fred D Waldhauer and Chung-Chih Cheng), *review* by J W R Griffiths, 838

Electronics, Institution of (Northern Division) Fourteenth Exhibition of Electronic Devices, 1277
Electronics (Medical) Bibliography of (prepared by the Medical Electronics Center of the Rockefeller Institute), 1026
Electronics (Medical), International Federation for (Electronics and Communications Section of the Institution of Electrical Engineers and the) Third International Conference on Medical Electronics, 1535
Electronics in Biology, *review* by W J Perkins, B A 4
Electronics Exhibition (V H Attree), 1277
Electronics Research Laboratory (Services) Symposium on Electron Bombardment Floating-zone Melting and Allied Electron Bombardment Techniques, 690
Electronics and Electron Physics Advances in (edited by L Marton assisted by Claire Marton), Vol 10, *review* by J R Tillman, 1601
Electrophoresis—Theory, Methods and Applications (edited by Milan Bier) *review* by Dr R Consden, 84
  The Principles of (René Audubert and Serge de Mende), translated by A J Pomerans, *review* by Dr R Consden, 84
Electrophoresis in Theory and Practice, *review* by Dr R Consden, 84
Electrophoresis of Human Gastric Juice (Dr Ragnhild Gullberg and Dr Borje Olhagen), 1848
Electrophoresis (Agar), of Normal Soluble Proteins in Guinea Pig Liver (Prof Iv Goranov, Y Todorov, X Skatshokova, M Hlebarova and P Kuzmanova), B A 64
Electrophoresis' ('Crossing-Paper) Proof of the Formation of Enzyme-Substrate Complex by (Prof S Nakamura, K Takeo, I Sasaki and M Murata), 638
Electrophoresis (High-Voltage Paper) of Aliphatic Amines and related Compounds (Dr D Gross), 1633
Electrophoresis (Paper) A Manual of Paper Chromatography and (Richard J Block, Emmett L Durrum and Gunter Zweig), second edition *review* by Dr R Consden, 1436
Electrophoresis (Paper), of Hippopotamus Haemoglobin (D H L Rollinson and G D Lomax), 1653
Electrophoresis (Paper), of Trypanosomal Extracts (Dr Robert S Desowitz), 986
Electrophoresis (Starch-Gel) Separation of Fast-Moving γ-Globulins by (Dr M D Poulik, Dr W W Zuelzer and Dr R Meyer), 1800
  Separation of Prealbumins by (Dr M D Poulik), 1067
Electrophoresis (Starch-Gel), of Seminal Plasma, Serum and Bile Visualization of Acid and Alkaline Phosphatase after (Dr Bengt Estborn), 1636
Electrophoresis (Two-Dimensional High-Voltage Paper), of Amino- and other Organic Acids (Dr D Gross), 1298
Electrophoresis and related Methods (Chromatography,) Chromatographic Reviews—Progress in (edited by Michael Lederer), Vol I *review* by Dr R Consden, 1436
Electrophoretic Heterogeneity of Trypsin (J C Perrone, L V Disitzer and A Iachan) 1225
Electrophoretic Mobility and Colourability of Substituted Human Serum Proteins Modifications in Immunological Behaviour, (M Steinbuch Dr J M Fine and A Battistini), 1571
Electrophoretic Patterns (Paper), obtained by Paraffin-Oil Fixation (H Waldmann-Meyer), 1567
Electrophoretic Patterns (Starch Gel) Localization of Haemocyanin on (J R Whittaker), 193
Electrophoretic Zones in Agar Gel Direct Spectroscopic Examination of (Dr G H Beaven and W B Gratzer), 359
Elektronenmikroskopie, Deutschen Gesellschaft fur Conference, 508
Element 102 (Nobelium) Research on (P R Fields *et al*), 507
Elementary Bodies Psittacosis (F L Constable), 473
Elementary Particles The Physics of (Prof J D Jackson), *review* by P T Matthews, 1677
Elements Heavier, *review* by Dr J K Dawson, 922
  Periodic Classification of (A A Clifford), 2012
  The Transuranium (Prof Glenn T Seaborg), *review* by Dr J K Dawson, 922
Elements of Engineering Statics (Prof H Deresiewicz), *review* by T M Charlton, 1674
Elements (Structural), of the Bacterial Cell Affinity of Lysozyme to, as studied with Enzyme Labelled with Radioactive Iodine (Prof C Weibull, B Zacharias and H Beckman), 1744
Elements (Trace), in Basic Magma Deposition of (R J P Williams), 44
Elements (Trace), in Marine Biological Ashes Some Activation Analyses of Six (R Fukai and Prof W W Meinke), 815
Elements other than Carbon Substitution at (Sir Christopher Ingold), *review* by Dr R I Reed, 1262
Eleusine indica (L) Gaertn Vivipary in (H T Clifford), 1888
Elevated Plasma Sodium Concentration Effects of, on Sodium and Potassium in the Erythrocyte of the Lizard *Trachysaurus rugosus* (Gray), (P J Bentley), 1403
Eley, Prof D D (Cardew, M H , and) Energy Transfer with special reference to Biological Systems (Measurements on the Semiconductivity of Amino-acids, Haemoglobin and Globin), 689
Eley, Prof D D , and others (edited by) Advances in Catalysis and related Subjects Vol 10 *review* by Dr F S Stone, 1974
Elgaroy, Oystein Observations of the Fine Structure of Enhanced Solar Radio Radiation with a Narrow-Band Spectrum Analyser, 887
Elias, H -G Macromolecules (Practice of using Membranes partially Permeable to the Solute), 1689
Eliezer, Prof C J Appointed to the chair of mathematics in the University of Malaya in Kuala Lumpur, 307 , work of, 307
Elkind, M M , and Sutton, Harriet X-Ray Damage and Recovery in Mammalian Cells in Culture, 1293
Ellefsen, Ø Macromolecules (Preparation of a New Crystalline Modification of Cellulose), 1690
Ellem, Dr Kay The Structure of Science (Viral Nucleic Acids), B A 9
Ellem, Dr Kay, and others Ribonucleases of Mouse Tissues and of the Ehrlich Ascites Tumour, 984
Elliot, W H (Coleman, G , and) Structure and Chemistry of Proteins (Synthesis of α-Amylase by *Bacillus subtilis*), 1277
Elliott, L E , and others Gas Chromatographic Separation of Long-chain Fatty Acid Methyl Esters on Polyvinyl Acetate, 1710
Elliott, Paul R , and others Oxygen Uptake of Glycerol-extracted Muscle Fibres, 1947
Elliott, Dr S D Group and Type-specific Polysaccharides of Group *D* Streptococci, 1342
Ellis, Dr D V The Benthos of Soft Sea-bottom in Arctic North America, B A 79
Ellis, G R A , and Cartwright, D G Directional Observations of Radio Noise from the Outer Atmosphere, 1307
Ellis, G R A , and others Spaced Observations of Radio Noise from the Outer Atmosphere, 1391
Ellis, Dr J R , and Burton, M A Sterility in *Lathyrus odoratus* L , 204
Ellis, M J , and others A Haemoglobin with Unusual Alkaline-denaturation Properties in a Turkish-Cypriot Woman, 1876
Ellis, R B , and Hawthorne, J N 1-Glyceryl-2-*myo*-inositol Phosphate—Alternative Synthesis and Behaviour on Hydrolysis (Synthesis and Properties of 1-Glyceryl-2-*myo*-inositol Phosphate), 790
Elmes, Dr P (White Dr J C , and) Flow Properties of Biological Systems (Viscosity, Intrinsic Viscosity and Thixotropy Measurements on Dilute Bronchial Mucoid Sputum), 1540
Elmqvist, Dr A , and others Gel Filtration as a Method for Purification of Protein-bound Peptides exemplified by Oxytocin and Vasopressin, 1565
Elodi, P , and Szabolcsi, G Role of the Co-enzyme in the Stabilization of Glyceraldehyde-3-phosphate Dehydrogenase, 56
Eloranta, J (Linschitz, H , and) Fast Chemical Reactions in Solution (Flash Photolysis to Study Metal and Hydrocarbon Ion Solutions), 1453
Elsden, Dr S R Appointed to the chair of microbiology in the University of Sheffield, 234 , work of, 234
Elton, Dr G A H (Collison, Dr R , and) Gelation (The Swelling of Starch), 863
Elution of Lipids from Silicic Acid A Concave Concentration Gradient of Ethanol in Chloroform employed in (J J Wren), 816
Elvers (Migrating), *Anguilla vulgaris* Turt Discrimination between Ebb and Flood Tide in, by means of Olfactory Perception (F Creutzberg), 1961
Emanuel, Prof N M Oxidation of Organic Compounds (Oxidation of Inorganic and Organic Compounds by Permanganate), 327 , (Slow Branched-chain Oxidation Reactions of Hydrocarbons), 327
Embassy (United States), in India Appointment of Prof E C Watson as scientific attache to the, 1686
Embedding Resin Miscible with Water for Electron Microscopy (Dr I R Gibbons), 375
Embryo Sac-like Structures in the Microsporangia of *Leptomeria billardierii* R Br Occurrence of (Dr Manasi Ram), 914
Embryo (Chick) Inhibition of Skeletal Formation in the, following Administration of Tetracycline (Gerrit Bevelander, Hiroshi Nakahara and Gloria K Rolle), 728
Embryology *review* by Sir Julian Huxley, 1176
Embroylogy A History of (Dr Joseph Needham), second edition, *review* by Sir Julian Huxley, 1176
Emmons, Howard W (edited by) Fundamentals of Gas Dynamics, *review* by Prof J H Horlock, 1173
Embryonated Eggs and Unsusceptible Cell Lines Infectivity of Polio Virus Ribonucleic Acid for (P De Somer, Dr A Prinzie and E Schonne), 652
Embryonic Nutrition (edited by Dorothea Rudnick), (Developmental Biology Conference Series, 1956, under the auspices of the United States National Academy of Sciences—National Research Council), *review* by Dr D R Newth, 839
Embryos of Germinating Wheat Isolation and Purification of Nitrate Reductase from (D Spencer), 682
Embryos (Chick), injected with Adult Chicken Blood Cytological Identification of Proliferating Donor Cells in (P M Briggs and L N Payne), 1594
Embryos (Chicken) Combined Effects of Cortisone and Insulin on Developing (Dr Pietro de Franciscis and Prof Walter Landauer), 101
Embryos (Pea and Wheat) Fine Structure in Cells of (G Setterfield, H Stern and F B Johnston), 505
Embryos (Plant) A Quick Method for Extracting, from certain Types of Seed (M D Gwynne), 1588
Emeleus, H J and Sharpe, A G (edited by) Advances in Inorganic Chemistry and Radiochemistry, Vol I, *review* by Dr D W A Sharp, 1756
Emery, Dr T , and Neilands, Dr J B The Iron-Binding Centre of Ferrichrome Compounds, 1632
Emery, Dr V J Nuclear Forces and the Few-Nucleon Problem (Calculations of the Binding Energies of Nuclei using the Brueckner Method), 1114
Emetic Material Production of, by Species of *Fusarium* (Neville Prentice, A D Dickson and Prof J G Dickson), 1319
Emission of Relatively High-Energy Ions from Low-Voltage Arcs (E R Harrison), 245
Emission (Smoke), from Coal and Low-Temperature Chars (Studies of Coal), (D Finch), 426
Emission Microscopy (Electron) Field Effects on Chemisorbed Films in (R J Hill and P W M Jacobs), 895
Emissions caused by Solar Flares Rocket Studies of (United States National Science Foundation Grant), 406
α-Emitting Nuclides in Biological Material Spectroscopic Identification of (Prof W V Mayneord and C R Hill), 667
Emmelot, Dr P , and Bos, C J Efficiency of the Mitochondrial Oxidative Phosphorylations in Intact Ascites Tumour Cells, 2024
Emmett, Prof Paul H (edited by) Catalysis, Vol 5, Hydrogenation, Oxo-Synthesis, Hydrocracking, Hydrodesulphurization, Hydrogen Isotope Exchange and related Catalytic Reactions, *review* by Dr E B Maxted, 750 , Vol 6, Alkylation, Isomerization, Polymerization, Cracking and Hydroreforming, *review* by G R Noakes, 1090
Emotional and Motor Behaviour in Experimental Animals Differential Analysis of the Effects of Phenothiazine-Tranquillizers on (Dr M Taeschler and Dr A Cerletti), 823
Emson, H E (Stich, H F , and) Aneuploid Deoxyribonucleic Acid Content of Human Carcinomas, 290
Emulsifiers and Organic Diluents Effect of, in Soil Insecticide and Nematicide Formulations (F T Phillips), 1512
Emulsions (Lipid) Lymphoid Necrosis Induced by (Dr A A Shivas and Dr G P Fraser), 1813

Encephalitis Virus (Tick-borne) Infectious Ribonucleic Acid from Mouse Brains infected with (F Sokol, H Libikova and J Zemla), 1581
Encephalographic Frequency Range Subjective Light Pattern Spectroscopy in the (Prof M Knoll and J Kugler), 1823
Encephalomyelitis (Experimental 'Allergic') Various Types of Acquired Resistance to (G J Svet-Moldavsky, I A Svet-Moldavskaya and L I Raffkina), 1552
Enchytraeidae (Olig) A Sexual Reproduction in the (B Christensen), 1159
Encyclopaedia Large Soviet (Bolshaya Sovietskaya Enziclopediya), Vol 50, 857, 1451
Endocrine Actions (Anti-Atherogenic and) The C_{17}-OH Group of Œstradiol—Relationships between its (Dr Manuel Rene Malinow, Alvaro L Gimeno, Amanda A Pellegrino-Iraldi, Martha A Fernandez-Gimeno, Jorge L Lacuara and Jaime A Moguilevsky), 1720
Endocrine Control in Crustaceans (Dr David B Carlisle and Sir Francis Knowles), *review* by Prof J H Welsh, 1760
Endocrinology of Reproduction (edited by Prof Joseph Thomas Ve ardo), *review* by Dr T Mann, 1434
Endogenous Metabolism of a Respiratory-deficient Brewer's Yeast Effect of Oxygen on (V E Chester), 1956
Endogenous Rhythms of Body Temperature in Hibernating Bats (Prof Michael Menaker), 1251
Endopolyploidy in the Meristem of Onion Roots Nuclear Deoxyribonucleic Acid Content and (D Srinivasachar), B A 80
Endothelial Cells (Damaged) Some Properties of (Dr J R O'Brien), 1580
Endotoxins Interaction of Erythrocytes and (V Bokkenheuser and H J Koornhof), 109
Endres, Richard O , and others Transistor Electronics, *review* by J W R Griffiths, 838
Energies (Bond), of Carbon–Carbon Single Bonds Effect of Hybridization Changes on the (J E Bloor and S Gartside), 1313
Energy of Strong Pulses of Ionic Current Effects of the, on Micro-organisms in Suspension (B S Gossling), 1881
Energy (Chemical) Conversion of Light into, in Photosynthesis (Prof Daniel I Arnon), 10, *errata*, 1613
Energy (Free), of Hydrolysis of Adenosine Triphosphate Equilibrium Constant of the Galactokinase Reaction and (Dr M R Atkinson, Eleanor Johnson and Prof R K Morton), 1925
Energy (High-) Ions Emission of Relatively, from Low-Voltage Arcs (E R Harrison), 245
Energy (High) Radiation Estimation of Chain Fracture and Cross-Linking of Rubber by (P Hayden), 1865
Energy (Interchange), for Binary Systems Estimation of the, from Mutual Solubility Data (Kiyoharu Ishida), 814
Energy (Low-) Particle Tracks Bubble Counting on (I R Birss), 1474
Energy (Solar) Transactions of the International Conference on the Use of—The Scientific Basis (Tucson 1955), Vol I, The Available Energy, Measurement of Radiation , Vol 2, Thermal Processes, Part I, Section A, Flat Plate Collectors , Vol 2, Thermal Processes, Part I, Section B, High-Temperature Solar Furnaces, Solar Power , Vol 3, Thermal Processes, Part 2, Solar House Heating, Solar Water Heating, Solar Stoves, Solar Distillation , Vol 4, Photochemical Processes , Vol 5, Electrical Processes, *review* by Dr H Heywood, 217
Energy Spectrum Changes (Cosmic Ray) Evidence for, during a Forbush Decrease (K W Ogilvie and M M Winn), 888
Energy Supply (Metabolic) Maintenance of Semipermeability of Plant Cell Membranes in the Absence of (Dr B Ginzburg), 1073
Energy Transfer with special reference to Biological Systems (Faraday Society Discussion on), 688
Engel, C E Visual Illustration of University Lectures (The Lecture Theatre of the Future), 515
Engineering Basic Geology for Science and (Prof E C Dapples), *review* by Dr J C M Taylor, 1175
  Biochemical—Unit Processes in Fermentation (edited by Dr R Steel), *review* by Dr N Blakebrough 1598
  Cryogenic (Dr Russell B Scott), *review* by Dr G G Haselden, 1174
  Low-Temperature, *review* by Dr G G Haselden, 1174
  Man the Maker—a History of Technology and (Prof R J Forbes), *review* by Dr A R Hall, 921
Engineering in the University of Birmingham, 502
Engineering at Leicester, 938
Engineering (Highway and Traffic), at Birmingham, 939
Engineering Information Services, Ltd *Digest of Soviet Technology*, No I, 320
Engineering Man-power (Scientific and), in Great Britain, 1959 (Report of the Committee on Scientific Man-power of the Advisory Council on Scientific Policy), 1982
Engineering Materials and Design Conference on New, 1362
Engineering Statics Elements of (Prof H Deresiewicz), *review* by T M Charlton, 1674
Engineering (Chemical) Scheme for a Full-time Course in (Institution of Chemical Engineers), 856
Engineering (Chemical), in Britain Progress of (Sir Hugh Beaver), 408
Engineering (Chemical), at Leeds, 1106
Engineering (Electrical) Modern Network Theory in (University of Birmingham Conference on), 1691
Engineering (Electrical), at Newcastle-upon-Tyne, 404
Engineering (Electrical), at Southampton, 590
Engineering (Electrical), in the University of Western Australia, 93
Engineering (Illuminating) Society H R H The Duke of Edinburgh to become the first Honorary Fellow, 237
Engineering Practice Chemical (edited by Herbert W Cremer and Trefor Davies), Vol 6, Fluid Systems II, *review* by Prof J M Coulson, 132
Engineers (Scientists and), in Britain, 1982
Engineers (Chemical), Institution of Presidential Address (Sir Hugh Beaver), 408
  Scheme for a Full-time Course in Chemical Engineering, 856
Engineers (Electrical), Institution of Election of Officers, B A 16
  Christmas Holiday Lecture, Colour Television (G G Gouriet), 1535
Engineers (Electrical), Institution of, and the British Nuclear Energy Conference Convention on Thermonuclear Processes, 240
Engineers (Electrical), Institution of (Electronics and Communications Section) International Convention on Transistors and Associated Semiconductor Devices, 693
  International Transistor Exhibition, 693
Engineers (Electrical), Institution of (Electronics and Communications Section), and the International Federation for Medical Electronics Third International Conference on Medical Electronics, 1535
Engineers (Environmental), Society of Formation of, 408
Engineers (Gas), Institution of, and the British Coke Research Association (Coke Oven Managers' Association, the) Joint Meeting, 1778
Engineers (Instrumentation) Differential Equations for, *review* by Prof T A A Broadbent, 6
Engineers (Mechanical), American Society of Colloquium on Mechanical Impedance Methods for Mechanical Vibrations, 1958 (edited by R Plunkett), *review* by Prof R E D Bishop, 1764
Engineers (Mechanical), Institution of Symposium on Biomechanics, 512
  Discussion on the Computer in Production, 1613
Engineers (Mining), Institution of Election of R G Baker as president for 1960-61, 1845
  Election of A Hellemans and Dr J Taylor as honorary members, 1845
  Douglas Hay Medal awarded to A E Crook, 1845
  Maskell Peace Scholarship for 1959 awarded to P Hutchinson, 1845
Engineers (Mining, Metallurgical and Petroleum), American Institute of (Metallurgical Society of the) New series of books entitled Metallurgical Society Conferences, 1362
Engineers (Radio), British Institution of Clerk Maxwell Premium awarded to C Powell and D A Hendley, 857
  Heinrich Hertz Premium awarded to K Foster, 857
  Sir Louis Sterling Premium awarded to Dr A van Weel, 857
  Sir J C Bose Premium awarded to Dr B Ramachandra Rao, Dr M Srirama Rao and C Abhirama Reddy, 857
  Brabazon Premium awarded to Prof D G Tucker, Dr V G Welsby, R Kendall and D E N Davies, 857
  Marconi Premium awarded to Dr Morton B Prince and M Wolf, 857
Engines (Marine) Exhibition of Working Models of (Liverpool Public Museums), 1534
'England Finder' (Graticules, Ltd) 34
England (Rural), Council for the Preservation of (Sheffield and Peak District Branch) Twenty-eighth Annual Report (1959), 408
England and Wales Ninety-fifth Report (1958) of the Chief Inspector on Alkali, etc , Works in, 940
  Marital Fertility in (Prof E Grebenik), 1035
  Statistical Review of, for the Year 1957, Part 2, Tables, Civil (Registrar General), 1107
English Place-Name Society Vols 27, 28 and 29, The Place-Names of Derbyshire (Kenneth Cameron), Part I, Introduction, River-Names, etc , High Peak Hundred , Part 2, Scarsdale Hundred, Wirksworth Hundred, Morleyston and Litchurch Hundred , Part 3, Appletree Hundred, Repton and Gresley Hundred, Analyses, Index, *review* by I S Maxwell, 1767
English Rural Life, Museum of Report for 1958, 505
English Wallpaintings The Conservation of—being a Report of a Committee set up by the Central Council for the Care of Churches and the Society for the Protection of Ancient Buildings, 1119
Englishman's Food The (the late Sir Jack Drummond and Anne Wilbraham), revised by Dorothy Hollingsworth, *review* by Dr Leslie J Harris, 484
Enhanced Radiation on 200 Mc /s Correlation between the Intensity of the Umbra of Sunspots and (Per Maltby), 1391
Enhanced Solar Radio Radiation Observations of the Fine Structure of, with a Narrow-Band Spectrum Analyser (Oystein Elgaroy), 887
Enhanced Synaptic Function due to Excess Use (Dr Rosamond M Eccles and Dr R A Westerman), 460
Enhancement of Pigment Production by Pseudomonas (Dr A M Paton) 1254
Ennerdale Water Relict Fauna of—a Problem of Distribution (Dr W Pennington), 1421
Enrichment (Biogeochemical), of Fission Products (Prof Pontus Ljunggren), 912
Enseignement des Sciences, Vol I, No I, 593
Enterococcal Pyelonephritis in Mice An Experimental (Dr Arvid L Erlandson, jun , Dr Leola A Gagliardi and Dr Myron W Fisher), 561
Entomology Annual Review of, Vol 4 (edited by Edward A Steinhaus and Ray F Smith), *review* by Dr P T Haskell, 489
Entwistle, Alison, and Reiners, W J Incentives in the Building Industry (National Building Studies Special Report No 28), 98
Entwistle, Dr K M Metal Fatigue, *review*, 1438
Entwistle, P F , and others New Pests of Cocoa (*Theobroma cacao* L) in Ghana following Applications of Insecticides, 2040
Environment (Australian) Strontium-90 in the, 1957-58 (Dr F J Bryant, L J Dwyer, Dr J H Martin and Prof E W Titterton), 755
Environmental Engineers, Society of Formation of, 408
Environmental Influences on Prenatal Development (edited by Beatrice Mintz), (Development Biology Conference Series, 1956, under the auspices of the United States National Academy of Sciences—National Research Council) *review* by Dr D R Newth, 839
Enzymatic Decarboxylation of Stipitatonic and Puberolonic Acids Tropolone Biosynthesis—the (Prof Ronald Bentley and Clara P Thiessen), 552
Enzymatic Properties of Suspensions of Parenchymatous Liver Cells Some (Dr Keith S Henley, Ole Sorensen and H Marvin Pollard), 1400
Enzyme (Yeast) Enzymic Reduction of α-Aminoadipic Acid by (S Sagisaka and Prof K Shimura), 1709
Enzyme Chemistry Outlines of (Dr J B Neilands and Dr Paul K Stumpf), second edition, *review* by Dr Edwin C Webb, 1759
  Proceedings of the International Symposium on (Tokyo and Kyoto, 1957), (Science Council of Japan, under the auspices of the International Union of Biochemistry), *review* by Dr J B Chappell, 388
Enzyme Induction X-Ray Sensitivity and Target Volume of (Dr Helmut Pauly), 1570
Enzyme Inhibition Prevention of Foetal Development by (Prof G Kahlson and Elsa Rosengren), 1238
Enzyme Kinetics Non-Inverted versus Inverted Plots in (Dr B H J Hofstee), 1296 , (Dr Malcolm Dixon and Dr Edwin C Webb), 1298
Enzyme Labelled with Radioactive Iodine Affinity of Lysozyme with Structural Elements of the Bacterial Cell as studied with (Prof C Weibull, B Zacharias and H Beckman), 1744
Enzyme-Substrate Complex Proof of the Formation of, by 'Crossing-Paper Electrophoresis' (Prof S Nakamura, K Takeo, I Sasaki and M Murata), 638

Enzyme System Specificity of the Tryptophan Peroxidase-Oxidase (Dr R H Marchant), 1711
Enzyme System (Glycolytic) Role of the, in the Germination of Spores of *Bacillus coagulans* var *thermoacidurans* (Prof Mikio Amaha and Tomoko Nakahara), 1255
Enzyme System (A New), in the Tamarind (D Mukherjee and N A Khan), 1140
Enzyme Systems Behaviour of (Dr John M Reiner), *review* by Dr J B Chappell, 388
Enzyme Systems Responsible for Steroid Metabolism in Different Tissues and Subcellular Fractions Distribution of (Virendra B Mahesh and Frank Ulrich), 1147
Enzyme Systems (Mitochondrial) Effect of some Neuromuscular Blocking Agents on (Dr J H Koch and Dr C H Gallagher), 1039
Enzymes (Indian Institute of Science Symposium on), 1367
Enzymes (University of Wageningen Conference on), 687
Enzymes, *review* by Dr Edwin C Webb, 1759
Enzymes—Kinetics and Chemistry, *review* by Dr J B Chappell, 388
Enzymes The (edited by Paul D Boyer, Henry Lardy and Karl Myrbäck), Vol 1, Kinetics, Thermodynamics, Mechanism, Basic Properties, second edition, *review* by Dr Edwin C Webb, 1759
  Purification of (Dr B K Bachhawat), 1368
Enzymes in the Food Industry (Food Group of the Society of Chemical Industry Symposium on), 1366
Enzymes (Cell-free) Combined Use of Polymyxin and Acetone to obtain (J R Villanueva), 1565
Enzymes (Drug-Metabolizing) Stimulatory Effect of Foreign Compounds on Ascorbic Acid Biosynthesis and on (Dr A H Conney and Dr J J Burns), 363
Enzymes (Respiratory) Localization and Assay of, in Single Living Cells—Absorbancy Measurements on the *Nebenkern* (Dr Robert P Perry, Dr Bo Thorell, Dr Lennart Åkerman and Prof Britton Chance), 929 , Fluorescence Measurements of Mitochondrial Pyridine Nucleotide in Aerobiosis and Anaerobiosis (Prof Britton Chance and Dr Bo Thorell), 931 , Absorbancy Measurements on Liver and Kidney Cells (Dr Bo Thorell and Prof Britton Chance), 934
Enzymes and Radioactivity in Erythrocytes of Different Ages (Dr Lester M Levy, Harry Walter and Martin D Sass), 643
Enzymic Activities of Human Skeletal Muscle Mitochondria—a Tool in Clinical Metabolic Research (Dr L Ernster, Dr D Ikkos and Dr R Luft), 1851
Enzymic Conversion of L-Rhamnulose to L-Fuculose in *Escherichia coli* (Laura Frontali and Giorgio Tecce), 1315
Enzymic Disorder Essential Pentosuria—Renal or (Dr R C Bozian and Prof Oscar Touster), 463
Enzymic Mechanisms (Two), for Hydrogen Transport by Phenolic Œstrogens (Dr H G Williams Ashman, M Cassman and Margaret Klavins), 427
Enzymic Reduction of α-Aminoadipic Acid by Yeast Enzyme (S Sagisaka and Prof K Shimura), 1709
Eosine Reductive Photo-bleaching of—Primary Processes indicated by the Flash Technique (Shunji Kato and Masao Koizumi), 1620 , Effect of Added Substances on the Rate of Reductive Photo-bleaching (Kengo Uchida, Shunji Kato and Masao Koizumi), 1620
Ephemeris (Lunar), and the Frequency of Caesium in Terms of U T + ΔT An Error in the Determination of ΔT from the (C A Murray), 441
Ephrati-Elizur, Dr Erela, and Zamenhof, Prof Stephen Incorporation of 5-Bromouracil into Transforming Principle of *Bacillus subtilis* and its Biological Effects, 472
Ephrussi, Prof B Cytoplasmic Inheritance (Respiratory Deficiency in Yeast), 1012
Epinephrine and Norepinephrine Evidence of Side-Chain Cleavage during the Reaction of, with Ethylene Diamine (Dr Louis-P Joly and Dr Guy Nadeau), 1483
Epithelia (Squamous), in the Guinea Pig Renewal Times of some (H Platt), 1654
Epithelioma (Atypical), of Rat Occurrence of Polynucleotide Phosphorylase in (Dr Kunio Yagi, Takayuki Ozawa and Hiroshi Konogi) 1939
Epithelium (Olfactory) 'On' and 'Off'-Responses of the (Dr S F Takagi and Dr T Shibuya), 60
Eppley, Dr Richard, and others Effects of Auxin and Gibberellic Acid on Growth of *Ulothrix*, 556
Epstein, Dr Eugene E Anomalous Continuum Radiation from Jupiter, 52
Epstein, Dr S S (Timmis, G M , and) New Antimetabolites from Vitamin B_{12}, 1383
Equation (A Controversial), in Population Ecology (Dr A Milne), 1582 , (W B Yapp), 1582 , (Prof G C Varley), 1583
Equation (Warburg's) Application of, to Tissue Slices (Dr I S Longmuir and Dr Ann Bourke), 634
Equations Ordinary Differential (Dr Wilfred Kaplan), *review* by Prof T A A Broadbent, 6
Equations (Differential), for Instrumentation Engineers, *review* by Prof T A A Broadvent, 6
Equations (Partial Differential) Numerical Analysis and (George E Forsythe and Paul C Rosenbloom), *review* by Prof T A A Broadbent, 576
Equator (Magnetic) Possible Asymmetry in the Daily Range of the Geomagnetic Vertical Intensity around the (Dr C A Onwumechilli), 51
Equatorial Bird, *Quelea quelea* Effect of Photoperiod on the Gonadal Cycle in an (Dr Albert Wolfson and David P Winchester), 1658
Equatorial Bird (Xerophilous), *Quelea quelea* Duration of the Regeneration Period of the Internal Reproductive Rhythm in a (H J de S Disney, B Lofts and Dr A J Marshall), 1659
Equatorial Countercurrent (South), in the Pacific Ocean Evidence of a (Joseph L Reid, jun), 209
Equatorial Meteorology Value of Contour Analysis in (D H Johnson and Dr H T Morth), 1372
Equilibrium Vapour–Liquid (Eduard Hala, Jiři Pick, Vojtech Fried and Otakat Vilim), translated by G Standart, *review* by Dr R Sargent, 837
Equilibrium (Thermal) Influence of the Thomson Effect on the θ-φ Relationship for a Constrictive Resistance in (Dr W Davies), 975
Equilibrium Constant of the Galactokinase Reaction and Free Energy of Hydrolysis of Adenosine Triphosphate (Dr M R Atkinson, Eleanor Johnson and Prof R K Morton), 1925
Equilibrium Diagram for the System Al_2O_3-SiO_2 Revised (Shiger Aramaki and Prof Rustum Roy), 631
Equilibrium Treatise Vapour–Liquid, *review* by Dr R Sargent, 837
Equipment Hot Laboratory (United States Atomic Energy Commission), new edition, 155
Equus przewalskii The Mongolian Wild Horse (A G Bannikov), 1024 , (E Dagva), 1024 , (D Tzevegmid), 1024 , (I S Sles), 1024
Erdos, Prof E G , and others Activation and Inhibition of the Arylesterase of Human Serum, 430
Ergonomics, 421
Ergonomics Ten Years of (Alec Rodger), B A 20
Ergonomics Research Society Symposium on Ergonomics, its Place in Industry (Past Progress and Future Trends), B A 20
Ergun, S , and MacCartney, J T Coal Science (Spectroscopy of Coals—Light Spectroscopy), 413
Ergun, S , and Wender, I Coal Science (X-ray Scattering of Vitrinites reduced with Lithium in Ethylene Diamine), 412
Ergun, S , and others Coal Science (Ultra-fine Structure of Coals and Chars), 413
Eriophorum vaginatum L Mineral Uptake and Retention in Cotton-Grass (Gordon T Goodman and Donald F Perkins), 467, *erratum*, 1845
Eriophyses Floral Malformation in *Panicum antidotale* caused by a Species of (Dr V M Desai and Dr M J Thirumalachar), 1586
Erkrankten Zahngewebe des Menschen und der Wirbeltiere im Polarisationsmikroscop Die gesunden und die (Prof W J Schmidt und Dr A Keil), *review* by Prof A I Darling, 218
Erlandson, jun , Dr Arvid L , and others An Experimental Enterococcal Pyelonephritis in Mice, 561
Erley, D S , and others Post-Exposure Analysis of Organic Compounds in the Blood by a Rapid Infra-red Technique, 192
Ernster, Dr L , and others Enzymic Activities of Human Skeletal Muscle Mitochondria—a Tool in Clinical Metabolic Research, 1851
Erosion (Coast), and Accretion (British Association for the Advancement of Science, Sections E (Geography) and K (Botany), Discussion on), 499
Error in the Determination of ΔT from the Lunar Ephemeris and the Frequency of Caesium in Terms of U T + ΔT (C A Murray), 441
Erythrocyte of the Lizard *Trachysaurus rugosus* (Gray) Effects of Elevated Plasma Sodium Concentration on Sodium and Potassium in the (P J Bentley), 1403
Erythrocyte Membrane (Human) Active Transport of Uric Acid through the (Dr Kay Overgaard-Hansen and Dr Ulrik V Lassen), 553
Erythrocytes Influence of X-Rays on the Activity of Carbonic Anhydrase in, and on their Haemolytic Resistance (A Lauwers, J Van Bavinchove and W Dierick), 111
  Nonhaem Iron in, as a Precursor for Haemoglobin (Dr M Faber and Dr I Falbe-Hansen), 1043
Erythrocytes of Different Ages Enzymes and Radioactivity in (Dr Lester M Levy, Harry Walter and Martin D Sass), 643
Erythrocytes coated with Incomplete Antibodies Loss of Plasticity of (Prof C T Nicolau, P Teitel and M Fotino), 1808
Erythrocytes in Iranians Glutathione Stability of the (Dr D G Walker and Dr J E Bowman), 1325
Erythrocytes (Human) Glucose-6-phosphate Dehydrogenase and—Characteristics of Glucose-6-phosphate Dehydrogenase from Normal and Primaquine-sensitive Erythrocytes (Dr Henry N Kirkman), 1291 , Mechanism of Inactivation of Glucose-6-phosphate Dehydrogenase in Human Erythrocytes (Dr Paul E Carson, Stanley L Schrier and Robert W Kellermeyer), 1292
  Mechanism of Inactivation of Glucose-6-phosphate Dehydrogenase in (Glucose-6-phosphate Dehydrogenase and Human Erythrocytes), (Dr Paul E Carson, Stanley L Schrier and Robert W Kellermeyer), 1292
Erythrocytes (Mammalian) Metabolic Changes induced in, by Whole-Body X-Irradiation (Prof D A Rappoport and B W Sewell), 846
Erythrocytes (Normal and Primaquine-sensitive) Characteristics of Glucose-6-phosphate Dehydrogenase from (Glucose-6-phosphate Dehydrogenase and Human Erythrocytes), (Dr Henry N Kirkman), 1291
Erythrocytes (Tanned), in the Rabbit Production of an Agglutinating Auto-Antibody (Panagglutinin) Active upon (P O Hubinont, P Ghysdael and O Thys), 1250
Erythrocytes and Endotoxins Interaction of (V Bokkenheuser and H J Koornhof), 109
Erythroid Cells (Human), *in vitro* Lack of Direct Effect of Erythropoietin on (Edward L Alpen, L G Lajtha and Donald C Van Dyke), 1228
Erythropoietic Factor Disappearance of the, from Plasma of Anaemic Dogs after Nephrectomy (Dr Jean-Pierre Naets), 371
Erythropoietin Lack of Direct Effect of, on Human Erythroid Cells *in vitro* (Edward L Alpen, L G Lajtha and Donald C Van Dyke), 1228
Escherichia coli Enzymic Conversion of L-Rhamnulose to L-Fuculose in (Laura Frontali and Giorgio Tecce), 1315
  N,O-Diacetylneuraminic Acid and *N*-Acetylneuraminic Acid in (Dr C W De Witt and J A Rowe), 381
  Effect of Purine and Pyrimidine Analogues on Reversion of a Tryptophan-requiring Strain of (C O Doudney and F L Haas), 114
  Influence of DL-beta-Phenylserine on the Synthesis of Proteins in (J Janeček, J Chaloupka, K Vereš and M Havranek), 1895
Escherichia coli K-12 (Lysogenic) Induction of Phage Formation in the, by Mitomycin C (Dr Nozomu Otsuji, Dr Mutsuo Sekiguchi, Dr Teiji Iijima and Dr Yasuyuki Takagi), 1079
Escherichia coli 15*T* Influence of Unbalanced Growth on Subsequent X-Ray Induced Inhibition of Deoxyribonucleic Acid Synthesis in (Daniel Billen), 174
E coli adsorbed on a Resin, 'Dowex-I' Chemical Activities of (Tsutomu Hattori and Choseki Furusaka), 1566
Eserine Effect of Acetylcholine and, on the Spawning of *Hydractinia echinata* (M Yoshida), 1151
ESP Experimental Evidence for (C M Hansel), 1515
Espinosa, Dr E Production of γ- and α-Globulins by the Isolated and Perfused Rat Spleen, 1801
Essen, Dr L , and Parry, J V L An Improved Caesium Frequency and Time Standard, 1791
Essential Hypertension Haemodynamics in (Dr J Brod, V Fencl, Z Hej and J Jirka), 1643

Essential Pentosuria—Renal or Enzymic Disorder (Dr R C Bozian and Prof Oscar Touster), 463
Essentials of Human Reproduction (edited by Prof Joseph Thomas Velardo), *review* by Dr T Mann, 1434
Establishment of Parenchymatous Spleno-Pulmonary Venous Anastomosis (Dr George R Walker, Dr Paul Field and Dr Patrick E Conen), 703
Estborn, Dr Bengt Visualization of Acid and Alkaline Phosphatase after Starch-Gel Electrophoresis of Seminal Plasma, Serum and Bile, 1636
Esterase Inhibition and Organophosphorus Poisoning in the House-Fly (Dr D Stegwee), 1253
Esters (Carbohydrate Sulphate) Infra-Red Spectra of (Dr A G Lloyd and K S Dodgson), 548
Esters (Long-Chain Fatty Acid Methyl) Gas Chromatographic Separation of, on Polyvinyl Acetate (Irwin Hornstein, L E Elliott and P F Crowe), 1710
Esters (Phospholipid Phosphoric), in the Human Placenta (G Porcellati, B Curti and S Luciani), 1870
Esteve, J Martin, and others Radiomimetic Action of Lipoxidase, 1506
Estimates, Select Committee on, Session 1958-59 Seventh Special Report, Treasury Control of Expenditure (Observations of the Treasury), 696
Estimating Earthworm Populations by using Formalin (Dr F Raw), 1661
Estimation of Chain Fracture and Cross-Linking of Rubber by High-Energy Radiation (P Hayden), 1865
Estimation of the Interchange Energy for Binary Systems from Mutual Solubility Data (Kiyoharu Ishida), 814
Estimation of Linear and Non-Linear Structural Relations (D E Barton and C L Mallows), 1086
Estimation of μgm Quantities of Iron in Culture Medium using Bathophenanthroline (P A Seamer), 636
Estimation of Small Percentages of Foetal Haemoglobin (Prof K Betke, H R Marti and I Schlicht), 1877
Estimation of Vitamin C by Agar Diffusion (Alan H Chaiet and Louis Chaiet), 1487
Estimation (Colorimetric), of Citric Acid (Prof R E Macdonald and W E Waterbury), 988
Estimation (Nitrite), by Diazotization Measurement of Inhibition by Azide in Biochemical Assay Systems involving (Dr E J Hewitt and D G Hallas), 1485
Estimation (Quantitative), of the Fatty Acids of Olive Oil (J Gracian, E Vioque and Mª Pilar de la Maza), 1941
Estimation (Rapid), of the Specific Surface of a Powder (Dr H E Rose and R M E Sullivan), 46
Etching of Calcite (Dr N S Pandya and J R Pandya), 894
Ethanol Increase in the γ-Aminobutyric Acid Content of Rat Brain after Ingestion of (Dr H -M Hakkinen and E Kulonen) 726
Ethanol Tolerance of Rats Sex Difference in (Henrik Wallgren), 726
Ethanol in Chloroform A Concave Concentration Gradient of, employed in Elution of Lipids from Silicic Acid (J J Wren) 816
Ethanol in Man Extrahepatic Metabolism of (Dr J A Larsen), 1236
Ethanol Metabolism Relation of, to Several Factors in the Rat (Dr F W Kinard, J C Aull, jun , and R E Ulmer), 1721
Elher (3,4,ω-Trihydroxyacetophenone 3-methyl), in Adrenal Extracts (J von Euw, Prof T Reichstein, R Neher, Dr A Wettstein, Dr J F Tait and Dr S A S Tait) 268
Ethers (Isomeric O-Methyl), of Ethyl di-(4-hydroxycoumarinyl-3)-Acetate (the Anti-coagulant Drug Pelentane or Thromexane), (Dr Eduard Knobloch), 1568
Ethyl Alcohol Oxidation of, by a Mixture of Hydrogen Peroxide and Ferric Salts (Dr Mordechai L Kremer), 720
Ethyl di-(4-hydroxycoumarinyl-3)-Acetate (the Anti-coagulant Drug Pelentane or Thromexane) Isomeric O-Methyl Ethers of (Dr Eduard Knobloch), 1568
Ethyl Methane Sulphonate Mutation of Bacteria at High Levels of Survival by (Anthony Loveless and Sheila Howarth), 1780
17α-Ethyl-19-Nortestosterone Prolonged Survival of Dystrophic Mice treated with (Dr Robert M Dowben), 1966
Ethylene A Chemical Effect of, during the Storage of Peas (Prof Frank A Lee), 462
  Production of, by Mitochondria from Tomatoes (Prof Mary S Spencer), 1231
Ethylene *Bis*dithiocarbamates Insecticidal Action of (R D McMullen), 1338
Ethylene Diamine Evidence of Side-Chain Cleavage during the Reaction of Epinephrine and Norepinephrine with (Dr Louis-P Joly and Dr Guy Nadeau), 1483
Ethylenediamine Tetra-acetate Effect of, on Vitamin B_{12} Absorption in the Rat (Edward G Rice, Dr Samuel M Greenberg, John F Herndon and E J Van Loon), 1948
Etres Vivants Causes de la Répartition des (Raymond Furon), *review* by Prof Ronald Good, 390
Etruscan Origins Ciba Foundation Symposium on Medical Biology and (edited by G E W Wolstenholme and Cecilia M O'Connor), *review* by Madeleine Smith, 1348
Etruscans The Future of the, *review* by Madeleine Smith, 1348
Ettinger, R (Patterson, A , and) Fast Chemical Reactions in Solution (Carbon Dioxide–Water Equilibrium, using Nuclear Magnetic Resonance Methods), 1453
Ettori, Prof J and Scoggan, Sybil M Ionized Calcium in Biological Media, 1315
l'Etude Agronomique du Congo Belge Institut National pour Carte des Sols et de la Vegetation du Congo Belge et du Ruanda-Urundi, 6, Yangambi, Planchette 3, Lilanda, A, Sols , B Vegetation (Notice explicative par P Gilson, P Jongen, A Van Wambeke et L Liben), 27
  Publications, *Série* Scientique No 75, Moisissures du Sol et des Litières de la Région de Yangambi (J Meyer), 236
  Publications, Série Scientifique No 77, Recherches sur les Affinités Chromosomiques dans le Genre *Coffea* (J Bouharmont) 518
  Publications, Série Scientifique No 78, Recherches sur l'Autostérilité du Caféier robusta (*Coffea canephora* Pierre), (M Devreuk, G Vallaeys, P Rochet et G Filles), 518
l Etude Taxonomique de la Flore d'Afrique Tropicale, Association pour Vegetation Map of Africa (Explanatory notes by R W J Keay, with a French translation by A Aubreville), 594
Eucalyptus Floral Morphology and the Taxonomy of (Dr D J Carr and S G M Carr), 1549
Euglena gracilis A Biological Action of Deoxyribonuclease I on the Growth of (Dr Rudolf K Zahn), 1324
Eupagurus bernhardus (The Hermit Crab) The Sea Anemone (*Calliactis parasitica*) and (Dr D M Ross), 1161
Euphausiid *Thysanoessa raschii* Spectral Composition of the Luminescence of the (Dr Brian P Boden and Dr Elizabeth M Kampa), 1321
Europe The Profession of Government—the Public Service in (Dr Brian Chapman), 127
European Comparisons The Spirit of British Administration and some (C H Sisson) 128
European Corn Borer, *Ostrinia rubilalis* (Hbn) (Lepidoptera Pyralidae) Chemical Changes associated with Diapause in the (J A Mutchmor and J H Maruzek), 1077
European Economic Co-operation, Organization for First Meeting of the International Board of Management of the *Dragon* Project, 24
  Dragon Project of the, 24, 942
European Economic Co-operation, Organization for (European Nuclear Energy Agency) Formation of a Committee for European-American Nuclear Data, 1271
  Second Fuel Charge for the Boiling Heavy Water Reactor Project at Halden, Norway, 1844
European Economic Co-operation, Organization for (European Productivity Agency) Project 335, Fitting the Job to the Worker, a Survey of American and European Working Conditions in Industry, 422
European Nuclear Energy Agency of the Organization for European Economic Co-operation Foundation of a Committee for European—American Nuclear Data, 1271
  Second Fuel Charge for the Boiling Heavy Water Reactor Project at Halden, Norway, 1844
European Nuclear Energy Project, *Dragon*, 24, 942
European Nuclear Energy Research, 1278
European Organization for Nuclear Research (CERN) Present Status, 944
  International Co-operation in the field of High-Energy Accelerators, 1844
  Election of Officers, 1844
European Productivity Agency of the Organization for European Economic Co-operation Project 335, Fitting the Job to the Worker, a Survey of American and European Working Conditions in Industry, 422
European Research Associates, Brussels Grant of £1,200 to the University of Oxford, for research on acetylene chemistry, 1362
European Working Conditions (American and), in Industry Fitting the Job to the Worker—a Survey of (European Productivity Agency of the Organization for European Economic Co-operation, Project 335), 422
European–American Nuclear Data Committee for (European Nuclear Energy Agency of the Organization for European Economic Co-operation), 1271
Eutherian Mammals Chromosomal Evolution in (Prof Robert Matthey), 1329
Evans, E Ll (Kubaschewski, Dr O , and) Metallurgical Thermochemistry, *review* by Dr F C Thompson, 1765
Evans, G O Mites, or the Acari, *review*, 1677
Evans, Dr H E Appointed lecturer in engineering at the University College of Swansea, 156
Evans, J C , and others Sodium Regulation in the Blood of Parr and Smolt Stages of the Atlantic Salmon, 283
Evans, Dr J H Value of a Simple Observational Technique for Determining the Fat Content of Algal Cells, 1737
Evans, J V , and others Ultra-structure of the Myoneural Junction in Myasthenia Gravis, 1500
Evans, J V and Taylor, G N Radio Echo Observations of Venus, 1358
Evans-Pritchard, Prof E E An Anthropologist at Work *review*, 301
Even-Aged Plantations Pathogenic Factors in the Rooting Space and the Development of (W R Day), B A 46
Everard, C O R , and Feder, William A Effective Increase in Nematode Populations by the Addition of Aureomycin, 1887
Everett, D H , and Stone, F S (edited by) The Structure and Properties of Porous Materials—Proceedings of the Tenth Symposium of the Colston Research Society held in the University of Bristol, 1958, *review*, 1525
Evidence for Cosmic Ray Energy Spectrum Changes during a Forbush Decrease (K W Ogilvie and M M Winn), 888
Evidence for Distinct Sectors in Polymer Single Crystals (D C Bassett, Prof F C Frank and Dr A Keller), 810
Evidence from Distribution of Hydrogen Structure of Bituminous Coals—(Dr P H Given), 980
Evidence for a Hydrate of Cellulose from Studies of its Surface Properties (Dr J M Joubert, Dr G J R Krige and Dr K Borgin), 1561
Evidence for Phosphatidic Acid as the Sodium Carrier (Dr Lowell E Hokin and Mabel R Hokin), 1068
Evidence of Side-Chain Cleavage during the Reaction of Epinephrine and Norepinephrine with Ethylene Diamine (Dr Louis-P Joly and Dr Guy Nadeau), 1483
Evidence for a Sliding Filament Contractile Mechanism in Tonic Smooth Muscles of Lamellibranch Molluscs (Dr Jean Hanson and Dr J Lowy), 286
Evidence of a South Equatorial Counter-current in the Pacific Ocean (Joseph L Reid, jun), 209
Evidence (Experimental), for Extra-Sensory-Perception (C M Hansel), 1515
Evidence (Experimental) for Weeping Lubrication in Mammalian Joints (Mechanism of Animal Joints), (P R Lewis and Dr C W McCutchen), 1285
Evidence (Pharmacological), for the Presence of Arginine Vasotocin and Oxytocin in Neurohypophysical Extracts from Cold-blooded Vertebrates (Active Principles of the Neurohypophysis of Cold-blooded Vertebrates), (Wilbur H Sawyer, Robert A Munsick and Prof H B van Dyke), 1464
Evitt, W R Origin and Dispersal of Flowering Plants (Palaeozoic Marine Sequences from New York and Australia), 1200
Evoked Potentials in Visual Cortex of the Unanaesthetized Cat (Gabriel Horn and John Blundell), 173
Evolution Behavior and (edited by Anne Roe and George Gaylord Simpson), *review* by Dr W H Thorpe, 1762
  Conception of—Meeting in Paris (Dr J Ramsbottom), 859
  Intraspecific Polyploidy and, of Diverse Morphological Forms of *Convolvulus pluricaulis* Chois (Dr S L Tandon and C P Mzalik), 481

Evolution of Behaviour, *review* by Dr W H Thorpe, 1762
Evolution of Host–Parasite Relationships (British Association for the Advancement of Science, Section D (Zoology), Symposium on), 760
Evolution of the Human Brain James Arthur Lecture on the—The Discrete and the Diffuse in Nervous Action (Prof P D C Lloyd), 1777
Evolution of Living Species (Royal Society of Victoria Symposium on), 156
Evolution of North America (Dr Philip B King), *review* by Dr J W Cowie, 1600
Evolution der Tiere Die Banderschnecken, eine Studie zur (Prof Dr F A Schilder und Dr Maria Schilder), *review* by Dr A J Cain, 390
Evolution (Chromosomal), in Eutherian Mammals (Prof Robert Matthey), 1329
Evolution (Social), in Man Main Stages of (Dr Max Pettersson), 481
Ewan, J Origin and Dispersal of Flowering Plants (Zoogeographical Data in the Interpretation of Existing Floristic Patterns), 1201
Ewe (Ovariectomized) Seasonal Changes in the Œstrous Response by the, to Progesterone and Œstrogen (Prof J I Raeside and M F McDonald), 458
Ewes (Ovariectomized) Maintenance of Pregnancy in, by means of Progesterone (N W Moore and L E A Rowson), 1410
Ewes' Milk Effect of Cobaltic Oxide Pellets on the Vitamin B$_{12}$ Content of (L I Hart and E D Andrews), 1242
Examination (Direct Spectroscopic), of Electrophoretic Zones in Agar Gel (Dr G H Beaven and W B Gratzer), 359
Excerpta Medica Foundation Cancer Current Literature Index, 941
Excess Hydrocortisone Mechanism of the Atherogenic Action of (Dr Henry Grossfeld), 38
Excess of Iron in the Forage A Lesion of the Follicle and of the Fibre of Wool and its Possible Relation with an (Prof G Gonzelez, J Garcia and E Fernandez), 559
Excess Use Enhanced Synaptic Function due to (Dr Rosamond M Eccles and Dr R A Westerman), 460
Exchange of Potassium-42 by the Foetal Metanephros and Foetal Liver Relative Rates of (Dr J G Bearn and Dr F T C Harris), 1959
Exchange (Radioactive) Labelling of Rose Bengal with Iodine-131 by (J Leibster and O Andrysek), 913
Exchange (Tritium) *In vitro* Labelling of Antibody Globulin by (Dr P C Rajam and Anne-Louise Jackson), 375
Exchange Interaction as a Cause of Reverse Thermo-Remanent Magnetism (T Nagata and S Uyeda), 890
Exchangeable Cations in Vermiculite Diffusion of (G F Walker), 1392
Exchangeable Phosphate (Isotopically), in Soil Effect of the Level of Microbial Population on (Dr P Newbould and Dr R L Lucas), 1155
Exchangers (Anion), based on Cellulose (Dr A O Jakubovic), 1065
Exchanges between Soviet and United States Scientists, 680
Excised Tomato Roots Nitrate Reduction by Aqueous Extracts of (C S Vaidyanathan and Prof H E Street), 531
  A Non-Dialysable Inhibitor of Glutamo-Transfarase present in (C S Vaidyanathan and Prof H E Street), 347
Excitability and Phosphorylation of Muscle and Nerve in Sodium-free Hydrazinium Solution (L G Abood and K Koketsu), 725
Excitation (Electronic) Transfer Mechanisms of (Prof Th Forster), 688
Excretion of Labelled Magnesium by the Sheep (D C Macdonald, A D Care and B Nolan), 736
Excretion (Urinary), of β-Amino-*iso*butyric Acid in Mongolism (Dr Thomas L Perry, Dr Kenneth N F Shaw and Dr Dorothy Walker), 1970
Excretion (Urinary), of some B Vitamins in Man Effect of Sorbitol on the (J D Watson and Prof John Yudkin), 911, *errata* 1362
Excretors (β-Amino-*iso*butyric Acid) High Prevalence of High-Level, in Micronesians (Dr B S Blumberg and Dr S M Gartler), 1990
Excursion Flora of the British Isles (Prof A R Clapham, Prof T G Tutin and Dr E F Warburg), *review* by P Falk, 1093
Executive Development Sandwich Course in (Sheffield College of Technology), 235
Exercise (Flight) Release by, of a Chemotropic Response from Photopositive Domination in a Scolytid Beetle (Prof Kenneth Graham), 283
Exhibition (Physical Society), 1688
Exhibition International Transistor (Electronics and Communications Section of the Institution of Electrical Engineers), 693
Exhibition of 1851, Royal Commission for the Awards of Studentships and Scholarships, 409
Exhibition of Aerial Photographs of Quarries and Mines (Geological Museum), 855
Exhibition of Electronic Devices Fourteenth (Northern Division of the Institution of Electronics), 1277
Exhibition of Engineering Materials and Design First 1362
Exhibition in Moscow of British Books and Periodicals (British Council and the Soviet Ministry of Culture), 1361
Exhibition of Working Models of Marine Engines (Liverpool Public Museums), 1534
Exhibition (Science) The Cape Town, 1959 (Dr Ronald Singer), 952
Existence of an Inner Auroral Zone (Dr Knud Lassen), 1375
Expanding Universities Administrative Problems in (Home Universities Conference 1959), 1613
Expansion of Educational and Training Facilities in Britain, 569
Expansion of University Education in Britain, 1431
Expansion (Permanent Moisture), of Clay Products on Natural Exposure (J S Hosking and H V Hueber), 1373
Expansion (Urban) Trends in (Prof K C Edwards), B A 43
Expenditure Treasury Control of (Observations of the Treasury), (Seventh Special Report from the Select Committee on Estimates, Session 1958-59), 696
Expenditure (Government Research and Development), in Britain Control of, 696
Expenditure (Public) Control of, 857
Expenditure (United States), on Research and Development in 1957, 1022
Experience The Nature of (Sir Russell Brain), *review* by F I G Rawlins, 218
Experimental 'Allergic' Encephalomyelitis Various Types of Acquired Resistance to (G J Svet-Moldavsky, I A Svet-Moldavskaya and L I Raffkina), 1552
Experimental Animals Differential Analysis of the Effects of Phenothiazine-Tranquillizers on Emotional and Motor Behaviour in (Dr M Taeschler and Dr A Cerletti), 823
Experimental Conditions Force-Feeding Fish under (Dr J M Dodd, Dr M H I Dodd and Dr C K Goddard), 1650
Experimental Demonstration of an Internal Rhythm of Reproduction in a Trans-Equatorial Migrant (the Short-tailed Shearwater *Puffinus tenuirostris*), (Dr A J Marshall and Dr D L Serventy), 1704
Experimental Diphtheric Intoxication Effect of Tranquillizing Drugs on Survival from (Prof Leo Greenberg and Dr James W Ingalls), 1721
Experimental Enterococcal Pyelonephritis in Mice (Dr Arvid L Erlandson, jun, Dr Leola A Gagliardi and Dr Myron W Fisher), 561
Experimental Evidence for Extra-Sensory-Perception (C M Hansel), 1515
Experimental Evidence for Weeping Lubrication in Mammalian Joints (Mechanism of Animal Joints), (P R Lewis and Dr C W McCutchen), 1285
Experimental Galactose Cataract Carbohydrate Metabolism in the (Dr Sidney Lerman), 1406
Experimental Music—Composition with an Electronic Computer (Prof L A Hiller, Jr, and Leonard M Isaacson), *review* by Prof E G Richardson, 1754
Experimental Production of Magnesium Deficiency in Lambs on a Diet containing Roughage (Dr D M McAleese and Dr R M Forbes), 2025
Experimental Science A History of Magic and (Prof Lynn Thorndike), Vols 7 and 8, The Seventeenth Century, *review* by Dr V A Eyles, 1899
Experimental Technique (Humane) The Principles of (Dr W M S Russell and R L Burch), *review* by Prof M Weatherall, 1675
Experimental Techniques Structure Analysis and (Institute of Physics Conference on), 857
Experimental Techniques in Low-Temperature Physics (Guy Kendall White), *review* by Prof J F Allen, 1260
Experimental Test (A New), of Special Relativity (J P Cedarholm and Prof C H Townes), 1350
Experimental Tests of Quantum Electro-dynamics (Prof W E Lamb), 954
Experiments Humane, *review* by Prof M Weatherall, 1675
  Planning of (Dr D R Cox), 156
Experiments on the Acousto-Electric Effect (Piroska Smith (*nee* Vermes) and D O Sproule) 264
Experiments on Automobile Collisions (Prof J H Mathewson), 237
Experiments on the Development of Isolated Blastomeres of Mouse Eggs (Dr Andrzej K Tarkowski), 1286
Experiments on Duck Red Cells *in vitro* Role of Stroma in Haemoglobin Synthesis—(A Breccia, A L Fantola, E Lazzarini and A Giustina), 1878
Experiments on Rice's Blue Material Some (J W Clarke and G McTurk), 2014
Experiments on Wool from Copper-deficient Sheep (R W Burley and F W A Horden), 1725
Experiments (Carbon-14 Dioxide), with Hydrocortisone Liver Glucosyl Oligosaccharides and Glycogen—(Dr Hsien-Gieh Sie, Prof James Ashmore, Dr Robert Mahler and Prof William H Fishman), 1380
Experiments (Sterol-Balance), in Humans (Dr Harald Schon), 1872
Explanation (A Possible), of the Formation of Long Platelets from Pulmonary Megakaryocytes (Dr J George Sharnoff), B A 75
Explanation (A Possible), for Part of the Difference in Heat Tolerance Exhibited by *Bos taurus* and *Bos indicus* Beef Cattle (H P Ledger), 1405
Exploitation of Natural Animal Populations (British Ecological Society Symposium on), 1451
Exploration du Parc National de la Garamba Mission H de Saeger, Fasc 9, Écologie et Biologie des Grands Mammifères (Primates, Carnivores, Ongulés), (Jacques Verschuren), 155
Exploration of the Sea International Council for the Special International Geophysical Year Meeting (A J Lee and Dr D H Cushing), 1180
Explosion (Nuclear) (Johnston Island) Disturbance in the Ionospheric *F*-Region following the (C H Cummack and G A M King), B A
Explosion (Primer), Triggers Reaction (G Larikov), 447
Explosions in Solids, *review* by Dr Peter Gray, 664
Explosions (Nuclear) Geomagnetic and Ionospheric Phenomena associated with (Dr S Matsushita), B A 33
  Geophysical Effects of High-Altitude (W A Feibelman), 442
  Magnetic Effects resulting from Two High-Altitude (J A Lawrie, V B Gerard and P J Gill), B A 34
  Some Geomagnetic Phenomena associated with (Dr R G Mason and Dr M J Vitousek), B A 52
Explosions (Underground Test), in Britain, 1532
Exposure (Natural) Permanent Moisture Expansion of Clay Products on (J S Hosking and H V Hueber), 1373
Exposure (Occupational) Maximum Permissible Body Burdens and Maximum Permissible Concentrations of Radionuclides in Air and in Water for (United States National Bureau of Standards, Handbook 69), 939
Extended Dormancy of Deciduous Woody Plants treated in Autumn with Gibberellic Acid (Dr P W Brian, J H P Petty and P T Richmond), 69
Extent of Blood Sampling Effect of Dietary Fat and, on the Level of Plasma Cholesterol in the Rat (I Coleman and J M R Beveridge), 1039
External Worlds The Internal and the (Sir Cyril Hinshelwood), 1834
Exteroceptive Block to Pregnancy in the Mouse (Hilda M Bruce), 105
Extra-Sensory-Perception Experimental Evidence for (C M Hansel), 1515
Extra-Terrestrial Flight Behaviour in Conventional and (Air Commodore W K Stewart), 578
Extracellular Polysaccharide of *Azotobacter vinelandii* A Function for the (Dr Michael H Proctor), 1934
Extracorporeal Circuits Release of Adenosine Triphosphate and Serotonin from Injured Cellular Blood Elements in (Dr H S S Sarajas, Dr R Kristoffersson and Dr M H Frick), 1127
Extract (Whole Hypothalamic) Effects of Methylthiouracil or Thyroidectomy on Activation of Pituitary Acid Phosphatases *in vitro* by (Dr V Schreiber and Dr V Kmentova), 728
Extracting Plant Embryos from certain Types of Seeds A Quick Method for (M D Gwynne), 1588
Extraction of an Actomyosin-like Protein from Human Thrombocytes (M Bettex-Galland and Dr E F Luscher), 276
Extraction of Radioactivity from Air Condensation Processes for the (Rama), 1789

Extraction of the Total Protein from Wheaten Flour in the Form of Soluble Derivatives (E E McDermott and Dr J Pace), 546
Extraction and Purification of 'Queen Substance' from Queen Bees (Dr C G Butler, Dr R K Callow and Norah C Johnston), 1871
Extracts of *Albizia* Species Physiological Activity in (A Lipton), 822
Extracts (Adrenal) 3,4,ω-Trihydroxyacetophenone 3-Methyl Ether in (J von Euw, Prof T Reichstein, R Neher, Dr A Wettstein, Dr J F Tait and Dr S A S Tait), 268
Extracts (Animal Tissue) Occurrence and Quantitative Determination of 2-Dimethylaminoethanol in (Dr Conrad G Honegger and Ruth Honegger), 550, *erratum*, 1986
Extracts (Aqueous), of Excised Tomato Roots Nitrate Reduction by (C S Vaidyanathan and Prof H E Street), 531
Extracts (Carrot) Biosynthesis of Carotenes in (Dr V V Modi and D K Patwa), 983
Extracts (Cell-Free) Effect of, from *Mycobacterium tuberculosis* H_{37} *Rv* on Lung Succinooxidase (Dr A Bekierkunst and M Artman), 458
Extracts (Coal) Biological Properties of Coal and (Dr A A Mills), 1885
Extracts (Fish and Frog Hypophysial) Chromatographic and Biological Characteristics of (Active Principles of the Neurohypophysis of Cold-blooded Vertebrates), (B T Pickering and Prof H Heller), 1463
Extracts (Forest-Tree Litter) Factors in, affecting the Growth of Soil Micro-Organisms (Dr Roger Knowles and Edward Laishley), 1169
Extracts (Juvenile Hormone), of Insects Prothoracic Gland Stimulation by (Dr Lawrence I Gilbert and Dr Howard A Schneiderman) 171
Extracts (Neurohypophysial), from Cold-blooded Vertebrates Pharmacological Evidence for the Presence of Arginine Vasotocin and Oxytocin in (Active Principles for the Neurohypophysis of Cold-blooded Vertebrates), (Wilbur H Sawyer, Robert A Munsick and Prof H B van Dyke), 1464
Extracts (Plant) Tumour Production in Plants by (Dr Archana Sharma), 1083
Extracts (Soya) A Lipoperoxidase Factor in (Dr John A Blain and Edward C C Styles), 1141
Extracts (Tomato Crown-Gall Tissue) Occurrence of 3-Indolylacetic and 3-Indolecarboxylic Acids in (G Clarke, M H Dye and Prof R L Wain), 825
Extracts (Trypanosomal) Paper Electrophoresis of (Dr Robert S Desowitz), 986
Extrahepatic Metabolism of Ethanol in Man (Dr J A Larsen), 1236
Extreme Sensitivity of Germination and Photoperiodic Reaction in the Genus *Chenopodium* (Tourn) L (Dr Bruce G Cumming), 1044
Extremely High Temperatures (Electronics Research Directorate of the United States Air Force Cambridge Research Center Conference on, Boston, 1958), (edited by Dr Heinz Fischer and Lawrence C Mansur), *review* by Dr T E Allibone, 83
Extremely Low Temperature Prefreezing as a Method enabling Animals to survive Freezing at an (Eizo Asahina), 1003
Extremes Statistics of (Prof E J Gumbel), *review* by R N Curnow, 754
Eye Association between Colour of the Iris of the, and Reaction to Dental Pain (Dr Philip R N Sutton), 122
Eye Movement Recording (G H Byford), 1493
Eye Tissues Distribution of Radioactive Barium in (R J Garner), 733
Eyles, Dr V A A History of Magic and Experimental Science, *review*, 1899
Eyring, H Fast Chemical Reactions in Solution (Solution Structure and Fast Reactions), 1454

F-REGION (Ionospheric) Disturbance in the, following the Johnston Island Nuclear Explosion (C H Cummack and G A M King), B A 32
F_2 Ionospheric Layer Tides in the (Dr P Herrinck), 1055
*F*2 Layer of the Ionosphere Two Anomalies in the Behaviour of the (Sheila Croom, Audrey Robbins and J O Thomas), 2003
Faber, Dr M , and Falbe-Hansen, Dr I . Nonhaem Iron in Erythrocytes as a Precusor for Haemoglobin, 1043
Fabian Society Research Series No 209, The Universities—a Royal Commission (G C Moodie) 1432
Facial Eczema of Sheep in the Field *Sporidesmium bakeri* and (R H Thornton and D P Sinclair), 1327
Facilities (Educational and Training) in Britain Expansion of, 569
Factor (Antilipaemic X), of the Unsaponifiable Fraction of Crude Vegetable Oils Chromatographic Identification of the (Prof M C Nath, A Saikia and B I Uppin), 1635
Factor (Fertility), in *Salmonella typhimurium* (T Miyake), 657
Factor (Growth-Promoting) and a Tumour-Susceptibility Factor in Eggs Differentiation between a (Charles H Hill and Henry W Garren), 824
Factor (Histamine Sensitizing) Formation of the Toxoid of, in *Bordetella pertussis* (Prof Toshitaka Matsui and Yoshio Kuwajima), 199
Factor (A Lipoperoxidase), in Soya Extracts (Dr John A Blain and Edward C C Styles), 1141
Factor (Quadrupole Anti-Shielding), in Copper (E A Faulkner), 442
Factor (Serum) Transformation Reaction of Pneumococci in the Absence of (Prof Takeshi Odaka and Tadashi Watanabe), 471
Factor (Tumour-Susceptibility), in Eggs Differentiation between a Growth-Promoting Factor and a (Charles H Hill and Henry W Garren), 824
Factories, Chief Inspector of Annual Report on Industrial Health for 1958 (Ministry of Labour and National Service), 1023
  Annual Report for 1958 (Ministry of Labour and National Service), 1456
Factors Unidentified Chick Growth (J A Wakelam and W P Jafie), 272
  Unidentified Growth (K A Allen, J Stephens, W P Jaffe and J A Wakelam), 271
Factors in Forest-Tree Litter Extracts affecting the Growth of Soil Micro-Organisms (Dr Roger Knowles and Edward Laishley), 1169
Factors in the Rat Relation of Ethanol Metabolism to several (Dr F W Kinard, J C Aull, jun , and R E Ulmer), 1721
Factors (Dietary), in the Homograft Reaction (Dr A S Parkes), 699
Factors' ('Iron Transport) An Absolute Requirement for, by *Microbacterium lacticum* 8181 (Dr D Hendlin and Dr A L Demain), 1894
Factors (Pathogenic), in the Rooting Space and the Development of Even-Aged Plantations (W R Day), B A 46
Factors (Selection), in a Tropical Trawl Fishery Prediction of (Alan R Longhurst), 1170
Fagnani, Prof G Alpine Mineral Fissures (Relationship of Alpine Fissure Minerals to those of the Druses in the Granite of Baveno), 1909
Fahey, John L , and Potter, Michael Bence Jones Proteinuria associated with a Transplantable Mouse Plasma-Cell Neoplasm, 654, *erratum*, 1108
Fahlen, Goran Rete Mirable in the Gas Bladder of *Coregonus lavaretus*, 1001
Fahmy, Dr Myrtle J (Fahmy, Dr O G , and) Complementation among the Sub-Genic Mutants in the *r*-Locus of *Drosophila melanogaster*, 1927
Fahmy, Dr O G , and Fahmy, Dr Myrtle J Complementation among the Sub-Genic Mutants in the *r*-Locus of *Drosophila melanogaster*, 1927
Fahraeus, G (Ljunggren, H , and) Effect of *Rhizobium* Polysaccharide on the Formation of Polygalacturonase in Lucerne and Clover, 1578
Failure of Corpuscles of Stannius from Winter Flounder (*Pseudopleuronectes americanus*) to Synthesize Adrenocorticosteroids *in vitro* (Dr J G Phillips and Dr P J Mulrow), 558
Failure to Recover infective 'Ribonucleic Acid' from Myxovirus Preparations (G L Ada, Patricia E Lind, Lois Larkin and Sir Macfarlane Burnet), 360
Fairbairn, J W (edited by) The Pharmacology of Plant Phenolics—Proceedings of a Symposium held at Oxford, 1958, *review* by Dr F A Robinson, 486
Fairbrother Dr F Appointed professor of inorganic chemistry in the University of Manchester, 1986
Faith of a Realist, *review* by F I G Rawlins, 388
Faktor, Dr M M (Bradley, Dr D C , and) Volatile Methoxides of Aluminium and Zirconium, 55

Filamentous Mould *Penicillium chrysogenum* and the Control of its Morphology Continuous-Flow Culture of the (S J Pirt and D S Callow), 307
Filaments (Microbiological), in Soils Occurrence of (Roy D Bond), 744
Filarski, Dr J Polar Front Survey (Hydrography—North Sea), 1183
'Fill', (Internal Fat,) and the Herbage Intake of Grazing Cattle A Relationship between Weight of (J C Tayler), 2021
Film (Transparent Cellulose) Use of, for Roller Tube Tissue Cultures (John A Sharp), 1508
Film Council, British Universities Twelfth Annual General Meeting (Dr J Horne), 330
  Discussion on the Visual Illustration of University Lectures, 515
Film Research (Instructional), in Pennsylvania (C Denis Pegge), 866
Film Thickness Measurement by Beam Interferometry Substrate Damage in (Prof G David Scott), 354
Films (British Books and) Distribution of, Overseas, 1448
Films (Chemistry) Index of (Royal Institute of Chemistry), *review* 1902
Films (Chemisorbed), in Electron Emission Microscopy Field Effects on (R J Hill and P W M Jacobs), 895
Films (Interlamellar) Phase Transitions in (Dr D M C MacEwan and Dr F Aragon de la Cruz), 1859
Filmstrips for Schools, 1777
Filson, A , and others Action of Mixed Solvents on Wool, 444
Filter (Continually Renewable) A Partial Chemical Characterization of Maize Coleoptile Cell Walls prepared with the Aid of a (Prof Aleksander Kivilaan, Teofila C Beaman and Robert S Bandurski), B A 81
Filters (Cellulose Membrane) Relation of Invasive Capacity to Passage of Lymphocytic Cells through (Dr Emma Shelton and Dr Mary E Rice), 479
Filtrate (Leukaemic) Fate of Subcutaneous Thymus Grafts in Thymectomized Mice Inoculated with (J F A P Miller), 1809
Filtration (Gel), as a Method for Purification of Protein-bound Peptides as exemplified by Oxytocin and Vasopressin (E B Lindner, Dr A Elmqvist and Dr J Porath), 1565
Finan, Dr P A , and Reed, Dr R I Application of the Mass Spectrometer to Polysaccharide Chemistry, 1866
Finance Museums and (Museums Association Discussion on), 598
Financial Structure of the Colonial Development Corporation Report of the Committee of Enquiry into the, 1520
Finch, D Studies of Coal—Smoke Emission from Coal and Low-Temperature Chars, 426
Finder' The 'England (Graticules, Ltd), 34
Fine, Dr J M (Moullec, Dr J , and) Frequencies of the Haptoglobin Groups in 406 French Blood Donors, 196
Fine, Dr J M , and others Modifications in Immunological Behaviour, Electrophoretic Mobility and Colourability of Substituted Human Serum Proteins, 1571
Fine Structure in Cells of Pea and Wheat Embryos (G Setterfield, H Stern and F B Johnston), 505
Fina Structure of Enhanced Solar Radio Radiation Observations of the, with a Narrow-Band Spectrum Analyser (Oystein Elgaroy), 887
Fine Structure in Muscle Ionic Partition and (Dr Shirley E Simon), 1978
Finney, Dr D J The Fundamentals of Statistical Reasoning, *review*, 217
Fire Research The Use of Models in (Committee on Fire Research and the Fire Research Conference of the Division of Engineering and Industrial Research of the United States National Academy of Sciences–National Research Council Symposium on), 772
First Abyssal Priapulid *Priapulus abyssorum*, New Species, the (Robert J Menzies), 1585
First Atomic Merchant Ship, B A 15
First Minister for Science (Rt Hon Viscount Hailsham), 1263
Firth, Shaun Science by the Upper Form (The Sedges of Askham Bog), 597
Fische Perus, II Beitrage zur Kenntnis der (Dr Hans-Wilhelm Koepcke), (Beitrage zur Neotropischen Fauna), *review* by Dr F A Turk, 1177
Fischer, Dr Heinz, and Mansur, Lawrence C (edited by) Conference on Extremely High Temperatures (sponsored by the Electronics Research Directorate of the United States Air Force Cambridge Research Center, Boston, 1958), *review* by Dr T E Allibone, 83
Fiset, Paul (James, Suzanne M , and) Serum Inhibitors of Asian Strains of Influenza Virus, 1656
Fish Force-Feeding, under Experimental Conditions (Dr J M Dodd, Dr M H I Dodd and Dr C K Goddard), 1660
  Multiple Haemoglobins in (Dr N Chandrasekhar), 1652
Fish (Freeze-dried Pork and) Absorption of Atmospheric Moisture by (Norman A Matheson), 1949
Fish (Zebra) Variations in Early Cleavage of the (A W Marrable), 1160
Fish Liver Oils Isomers of Vitamin A in (Patricia S Brown, William P Blum and Max H Stern), 1377
Fish Mucus Species Specificity of (J M Barry and Prof Fergus J O'Fourke), 2039
Fish and Frog Neurohypophysial Extracts Chromatographic and Biological Characteristics of (Active Principles of the Neurohypophysis of Cold-blooded Vertebrates), (B T Pickering and Prof H Heller), 1463
Fisher, E W , and Dalton, R G Cardiac Output in Horses, 2020
Fisher, Dr M E Fluctuation Phenomena and Stochastic Processes (Shapes and Sizes of Polymer and Polyelectrolyte Molecules which seriously affected Properties like Viscosity), 510

Fisheries Research (Sea), in East Africa, 855
Fishery Research (J H S Blaxter) 865
Fishery (Tropical Trawl) Prediction of Selection Factors in a (Alan R Longhurst), 1170
Fishes Development of the Yolk Nucleus in the Oocytes of some (Prof A Stolk), 1746
  A Ligament in the Dorsal Aorta of certain (Dr L L de Kock and Dr S Symmons), 194
  Studies on Social Groupings in (Dr C M Breder, Jr), 865
  Urethane as a Carcinogen and as an Anaesthetic for (Dr J N Ball and Prof P N Cowen), 370
Fishman, Prof William H , and others Liver Glucosyl Oligosaccharides and Glycogen—Carbon-14 Dioxide Experiments with Hydrocortisone, 1380
Fission (Triple), of Uranium-235 Two Cases of (J Catala, J Casanova and V Domingo), 1057
Fission Products Biogeochemical Enrichment of (Prof Pontus Ljunggren), 912
Fissures Alpine Mineral (International Mineralogical Association Symposium on), 1909
Fistulae (Bile) Thirst for Bile in Rats with (Dr Albert J Bertinchamps, James J Greenough and George C Cotzias), 1405
Fitch, R K , and others Ionization Phenomena in Gases (State of the Cathode on Growth Times and Sparking Potentials in Hydrogen), 1354
Fite, W L Ionization Phenomena in Gases (Recent Advances in the Study of Collision Processes in Gases), 1353
Fitter, R S R A New Service for Naturalists, 1774
Fitting the Job to the Worker, a Survey of American and European Working Conditions in Industry (European Productivity Agency of the Organization for European Economic Co-operation, Project 335), 422
Fixation of Nitrogen by the Rice Plant (S P Chakraborty and S P Sen Gupta), 2033
Fixation (Nitrogen), in a Uganda Swamp Soil (E A Calder), 746
Fixation (Non-Symbiotic Nitrogen), in a Soil of the Nigerian Rain-Forest Zone (Dr A W Moore and J N Abaelu), 75
Fixation (Paraffin-Oil) Paper Electrophoretic Patterns obtained by (H Waldmann-Meyer), 1567
Fixation (Symbiotic Nitrogen), of Legumes Influence of Temperature on the (the late Prof Margaretha G Mes), 2032
Flagellar Protein (Bacterial) ε-N-Methyllysine in (R P Ambler and M W Rees), 56
Flagellates Photoreactive Pigments in—Chromoprotein Pigments of some Cryptomonad Flagellates (Dr Mary Belle Allen, Dr Ellsworth C Dougherty and Dr John J A McLaughlin), 1047 , Phycoerythrins and Phycocyanins of Cryptomonads (Dr C OhEocha and M Raftery), 1049 , Photosynthetically Active Accessory Pigments of Cryptomonads (Dr F T Haxo and D C Fork), 1051
Flagellates (Cryptomonad) Chromoprotein Pigments of some (Photoreactive Pigments in Flagellates), (Dr Mary Belle Allen, Dr Ellsworth C Dougherty and Dr John J A McLaughlin), 1047
Flagrantes da Vida na Lunda (Introducao de Dr José Osorio de Oliveira), (Companhia de Diamantes de Angola, Museu fo Dundo, Publicacoes Culturais No 37), 236
Flare (Solar) Magnetic Field associated with a Great (Dr Robert Howard, Dr Thomas Cragg and Dr Horace W Babcock), 351
Flares on the Solar Disk Associated with Noise Distribution of (L R McNarry), 806
Flares (Solar) Association of Radio Outbursts with (L D de Feiter, A D Fokker and J Roosen), 805
  Rocket Studies of Emissions caused by (United States National Science Foundation Grant), 406
Flash Technique Primary Processes indicated by the (Reductive Photobleaching of Eosine), (Shunji Kato and Masao Koizumi), 1620
Flavin Adenine Dinucleotide Binding of the Sulphydryl Group in D-Amino-Acid Oxidase Apo-Protein with (Dr Kunio Yagi and Takayuki Ozawa), 1227
  Change of Absorption Spectrum of, by its Binding with both D-Amino Acid Oxidase Apo-Protein and Benzoate (Dr Kunio Yagi, Takayuki Ozawa and Minoru Harada), 1938
Flavins Complex Formation of Chlorpromazine with (Dr Kunio Yagi, Takayuki Ozawa and Toshiharu Nagatsu), 982
  Effect of, on Cramp caused by Phenol (Dr Kunio Yagi, Dr Hirofumi Yagi and Dr Ikuko Nagatsu), 1648
Flavins as Components of Folic Acid Reductases (Dr Beatriz M Braganca and U W Kenkare), 1488
Flavones N-Substituted 7-Methoxy-8-Aminomethylchromones and—New Brain-Stem Stimulants (P Da Re, L Verlicchi, Dr I Setnikar, W Murmann and M J Magistretti), 362
Fleck, Sir Alexander New Research Laboratories of the British Non-Ferrous Metals Research Association opened by, 234, 242
Fleming, N , and Robinson, D W Recent Studies of Noise Problems (Human Response to Noise—Evaluation of the Loudness of a Complex Sound), 414
Flesher, Dr Anna M , and others Prophylactic Effects of Amine Oxides in Radiation Injury in Mice, 198
Fletcher, T W Lancashire Livestock Farming in the Great Depression, 1916
Fletcher, Dr Wm W , and others Gibberellic Acid and Nodulation of Legumes, 1576
Flett, Dr T M Appointed to a senior lectureship in pure mathematics in the University of Liverpool, 410
Flexner (Abraham) Lectures of Vanderbilt University, 1958 (Sir Macfarlane Burnet), *review* by Dr J H Humphrey, 753
Flies Plastron Respiration in the Eggs of *Drosophila* and other (Dr H E Hinton), 280
Flies (House-) Mechanisms of Resistance of Adult, to the Insecticide Dieldrin (F P W Winteringham and A Harrison), 608
  Pentachloro*cyclo*hexane as a Possible Intermediate Metabolite of Benzene Hexachloride in (R G Bridges), 1337
  Resistance of, to γ-Benzene Hexachloride and Dieldrin (R G Bridges and J T Cox), 1740

Flight Behaviour in Conventional and Extra-Terrestrial (Air Commodore W K Stewart), 578
  The Story of (Victor Wall), 1535
Flight (Space) Russian View of, *review* by D G King-Hele, 836
Flight Exercise Release by, of a Chemotropic Response from Photopositive Domination in a Scolytid Beetle (Prof Kenneth Graham), 283
Floating (Free-) Marine Red Alga (Dr H B S Womersley and Dr R E Norris), 828
Floating-zone Melting (Electron Bombardment), and Allied Electron Bombardment Techniques (Services Electronics Research Laboratory Symposium on), 690
Flood Tide Discrimination between Ebb and, in Migrating Elvers (*Anguilla vulgaris* Turt) by means of Olfactory Perception (F Creutzberg), 1961
Flora Circumpolar Arctic (Dr Nicholas Polunin), *review* by R D Meikle, 1347
Flora of the Arctic, *review* by R D Meikle, 1347
Flora of Guatemala (Paul C Standley and Julian A Steyermark), 771
Flora of Peru (Rogers McVaugh), *review*, 666
Flora of Tropical East Africa—Leguminosae subfamily Mimosoideae (J P M Brenan), 409
Flora (Excursion), of the British Isles (Prof A R Clapham, Prof T G Tutin and Dr E F Warburg), *review* by P Falk, 1093
Floral Abnormalities in Broccoli (D R Sampson and M MacArthur), 682
Floral Initiation and its Relationship to Growth-Stage in Red Clover (*Trifolium pratense* L), (J L Stoddart), 559
Floral Malformation in *Panicum antidotale* caused by a Species of *Eriophyses* (Dr V M Desai and Dr M J Thirumalachar), 1586
Floral Morphology and the Taxonomy of Eucalyptus (Dr D J Carr and S G M Carr), 1549
Flore Afrique Tropicale, Association pour l'Étude Taxonomique de la Vegetation Map of Africa (Explanatory Notes by R W J Keay with a French translation by A Aubreville), 594
Floristic Studies New, 409
Flotation (Ion) Concentration by (Prof F Sebba), 1062
Flounder (Winter), *Pseudopleuronectes americanus* Failure of Corpuscles of Stannius from, to Synthesize Adrenocorticosteroids *in vitro* (Dr J G Phillips and Dr P J Mulrow), 558
Flour (Wheaten) Extraction of the Total Protein from, in the Form of Soluble Derivatives (E E McDermott and Dr J Pace), 546
Flow of Blood through Narrow Tubes (Prof M Reiner and Dr G W Scott Blair), 354
Flow of Compressible Fluids, *review* by Dr W P Jones, 485
Flow through Porous Media Sedimentation Rates, Fluidization and (Colin C Harris), 716
Flow in Vascular Beds Resistance to (Harris S Burry), 453
Flow Properties of Blood and other Biological Systems (British Society of Rheology and the Colloid and Biophysics sub-Committee of the Faraday Society Discussion on), 322, 1539
Flow (Compressible Fluid) Mathematical Theory of (Richard von Mises), (completed by Hilda Geiringer and G S S Ludford), *review* by Dr W P Jones, 485
Flow (Continuous-) Culture of the Filamentous Mould *Penicillium chrysogenum* and the Control of its Morphology (S J Pirt and D S Callow), 307
Flow (Renal Blood) Mechanism of Autoregulation of (Dr Allen M Scher), 1322
Flow (River), in Great Britain (F W H Green), 210
Flower Petals of *Adonis annua* L Occurrence of Astaxanthin in the (A Seybold and Prof T W Goodwin), 1714
Flowering in Birch Seedlings Early Induction of (Dr K A Longman and Prof P F Wareing), 2037
Flowering and Fruit Set in Sweet Potato Effect of Indole Acetic Acid and α-Naphthalene Acetic Acid on the Growth, (G Satyanarayana and Dr G Rangaswami), B A 73
Flowering, Nodulation and Nitrogen Assimilation of *Vicia villosa* Influence of Gibberellic Acid and Photoperiod on the Growth, (the late Prof Margaretha G Mes), 2035
Flowering Plants The Families of (Dr J Hutchinson), second edition, Vol 1, Dicotyledons , Vol 2, Monocotyledons, *review* by Prof T G Tutin, 1759
  Origin and Dispersal of (Prof A S Boughey), 1200
Flowers (Female-sterile), in *Fuchsia* (M Holdsworth), 1024
Flowers and Ovaries (Inflorescences,), of an Apomict, *Aerva tomentosa* Forsk *In vitro* Culture of the (Prem Murgai), 72
Flowers and Runners in the Strawberry Effect of Gibberellic Acid on the Initiation of (P A Thompson and C G Guttridge), B A 72
Floyd, Dr W F Ergonomics, its Place in Industry, B A 20
Fluctuation Phenomena in Semi-Conductors (Prof A Van der Ziel), *review* by Dr R A Hyman, 1754
Fluctuation Phenomena and Stochastic Processes (Physical Society Conference on), 509
Fluctuations in Photon Streams (Dr Peter Fellgett, Dr R Clark Jones and Dr R Q Twiss), 967 , (Dr C W McCombie), 969
Fluctuations (Current), in the Oxide Cathode (Margaret Chisholm and Dr L Jacob), 1058
Flugge, S (herausgegeben von) Handbuch der Physik, Band 50, Astrophysik I, Sternoberflachen-Doppelsterne, *review* by Prof R O Redman, B A 3
Fluid Flow (Compressible) Mathematical Theory of (Richard von Mises), (completed by Hilda Geiringer and G S S Ludford), *review* by Dr W P Jones, 485
Fluid Systems, *review* by Prof J M Coulson, 132
Fluidization and Flow through Porous Media Sedimentation Rates, (Colin C Harris), 716
Fluids (Compressible) Flow of, *review* by Dr W P Jones, 485
Fluorescence Changes in, in a Frog Sartorius Muscle following a Twitch (Prof Britton Chance and Frans Jobsis), 195
Fluorescence Measurements of Mitochondrial Pyridine Nucleotide in Aerobiosis and Anaerobiosis (Localization and Assay of Respiratory Enzymes in Single Living Cells), (Prof Britton Chance and Dr Bo Thorell), 931
Fluorescent Schiff-Type Reagents for Cytochemical Detection of Polyaldehyde Moieties in Sections and Smears (Prof Frederick H Kasten, Vivian Burton and Peggy Glover), 1797
Fluorescent Substance (Red), in the Urine of Pyridoxine-deficient Rats 8-Hydroxyquinaldic Acid, the (Dr J K Roy, Dr R R Brown and Prof J M Price), 1573
Fluorescent Thyroid-stimulating Hormone in Rat Tissues Histological Localization of (Dr E E Mancini, O Vilar, J M Dellacha, A Gimeno and A Castro), 1733
5-Fluorouracil Massive Incorporation of, into a Bacterial Ribonucleic Acid (Dr Jack Horowitz and Prof Erwin Chargaff), 1213
Flux, J E C At the Conference of the Mammal Society of the British Isles (Colour Change in Wild Specimens of the Mountain Hare in Aberdeenshire), 30
Fluxes (Salicylate and Potassium), of Rat Diaphragm (Dr J A Hicklin), 2029
Fly (House-) Esterase Inhibition and Organophosphorus Poisoning in the (Dr D Stegwee), 1253
Fly (House) Reproduction Role of Cholesterol in (Ronald E Monroe), 1513
Fly (Tsetse) Tissue Culture Development of *Trypanosoma vivax* to the Infective Stage in (Dr William Trager), B A 30
Foard, Donald E Pattern and Control of Sclereid Formation in the Leaf of *Camellia japonica*, 1663
Fodder Beet, Mangels and Swedes (National Institute of Agricultural Botany Leaflets on), 1777
Foetal Development Prevention of, by Enzyme Inhibition (Prof G Kahlson and Elsa Rosengren), 1238
Foetal Haemoglobin Estimation of Small Percentages of (Prof K Betke, H R Marti and I Schlicht), 1877
Foetal Haemoglobin in the Monkey (Dr G H Beaven and W B Gratzer), 1730
Foetal Haemoglobin without α-Chains Haemoglobin 'Bart's', a (Abnormal Human Haemoglobins), (Dr J A Hunt and Dr H Lehmann), 872
Foetal Haemoglobin (Human) Heterogeneity of—Incidence of Foetal Variants in Singapore (Dr F Vella), 272
Foetal Human Haemoglobin (Adult and) Serological Distinction of (G R E Naylor and M E Adair), 1854
Foetal Liver Relative Rates of Exchange of Potassium-42 by the Foetal Metanephros and (Dr J G Bearn and Dr F T C Harris), 1959
Foetal Metanephros and Foetal Liver Relative Rates of Exchange of Potassium-42 by the (Dr J G Bearn and Dr F T C Harris), 1959
Foetal Variants in Singapore Heterogeneity of Human Foetal Haemoglobin—Incidence of (Dr F Vella), 272
Foetal and Adult Sheep Inositol Concentration in the Cerebrospinal and Ocular Fluids and Tissues of the (D A Nixon), 906
Fokker, A D , and others Association of Radio Outbursts with Solar Flares, 805
Foliar Applications of its Salts on Apple Role of the Anion in Magnesium Uptake from (M Allen), 995
Folic Acid Reductases Flavins as Components of (Dr Beatriz M Braganca and U W Kenkare), 1488
Folley, Dr S J Sex on the Farm, *review*, 1091
Follicle and of the Fibre of Wool A Lesion of the, and its Possible Relation with an Excess of Iron in the Forage (Prof G Gonzelez, J Garcia and E Ferdendez), 559
Following Vivyl Polymerizations initiated by γ-Rays A Capacitance Method for (G J K Acres and F L Dalton), 335
Folsch, G , and others Action of Trypsin on α-Carbethoxy-L-lysyl-L-serylglycine and its O-Phosphorylated Analogue, 187
Fondation Universitaire, Bruxelles Rapport Annuel (1957-1958), 939
Food The Englishman's (the late Sir Jack Drummond and Anne Wilbraham), revised by Dorothy Hollingsworth, *review* by Dr Leslie J Harris, 484
Food for Survival after a Disaster (Dr R C Hutchinson), *review* by M W Grant, 841
Food Analysis, *review* by Dr V H Booth, 1347
Food Industry Enzymes in the (Food Group of the Society of Chemical Industry Symposium on), 1366
Food Manufacturing Industries Research Association, British Open Days (Prof B R Knapp), 1275
Food Products The Chemical Analysis of Foods and (Dr Morris B Jacobs), third edition, *review* by Dr V H Booth, 1347
Food Storage Infestation Control, a Service to Agriculture and (Ministry of Agriculture, Fisheries and Food), 941
Food and Agriculture, Ministry of (Government of India), and others Course on the Use of Radioisotopes in Agricultural Research, 1451
Food and Agriculture Organization (United Nations) Report of the Food and Agriculture Organization Nutrition Meeting in Europe, Rome, 1958, 407
  World Meeting on Veterinary Education, 943
Food and Agriculture Organization (United Nations), and others Course on the Use of Radioisotopes in Agricultural Research, 1451
Food and Agriculture Organization and the World Health Organization (United Nations) School-Feeding Seminar for countries in South and East Asia, 420
Foods and Food Products The Chemical Analysis of (Dr Morris B Jacobs), third edition, *review* by Dr V H Booth, 1347
Foot-and-Mouth Disease Effect of Proflavine on the Formation of the Virus of, and its Infective Ribonucleic Acid in Pig Kidney Tissue Culture Monolayers (F Brown and Doreen L Stewart), B A 74
Forage A Lesion of the Follicle and of the Fibre of Wool and its Possible Relation with an Excess of Iron in the (Prof G Gonzelez, J Garcia and E Fernandez), 559
Forages A Method of Increasing the Phosphorus Content of (Prof R Ferrando, S Metivier and R Gervy), 76
Foraminifera of the Oligocene of Belgium (D A J Batjes), 321
Forbes, Prof R J Man the Maker—a History of Technology and Engineering, *review* by Dr A R Hall, 921
Forbes, Dr R M (McAleese, Dr D M , and) Experimental Production of Magnesium Deficiency in Lambs on a Diet containing Roughage, 2025
Forbush Decrease Evidence for Cosmic Ray Energy Spectrum Changes during a (K W Ogilvie and M M Winn), 888
Force-Feeding Fish under Experimental Conditions (Dr J M Dodd, Dr M H I Dodd and Dr C K Goddard) 1660
Forces between Titanium Dioxide Pigment Particles (James E Latty and Dr W C Clark), 49
Forces (Swelling), in Straining Clays (E L Greacen), 1695

Ford, Prof P Title of professor emeritus conferred on, by the University of Southampton, 595
Forecasting Locust Outbreaks (Dr D L Gunn and P M Symmons), 1425
Foreign Bone Marrow in Lethally X-Irradiated Mice Abrogation by Injected Mouse Blood of Protective Effect of (L J Cole and R M Garver), 1815
Foreign Compounds Stimulatory Effect of, on Ascorbic Acid Biosynthesis and on Drug-Metabolizing Enzymes (Dr A H Conney and Dr J J Burns), 363
Foreign Markets British Books and, 605
Foreign Weeds Introduction of, into New Zealand (A J Healy), 1361
Forensic Science Society Meeting at the University of Nottingham to discuss the formation of a, 508
  Formation of the, 1271
Forest of Dean Committee Report for 1958 (Forestry Commission), 1005
Forest Areas Effects of, on Water Resources, and the Technique of Lysimeters—Water and Woodlands (Dr L Leyton), 1184 , Lysimeters (F W Green), 1186
Forest-Tree Litter Extracts Factors in, affecting the Growth of Soil Micro-organisms (Dr Roger Knowles and Edward Laishley), 1169
Forest (Rain-) Zone Non-Symbiotic Nitrogen Fixation in a Soil of the Nigerian (Dr A W Moore and J N Abaelu), 75
Forestry in New Zealand (Sir Harry Champion), 606
Forestry Commission Report of the Forest of Dean Committee (1958), 1005
  Thirty-ninth Annual Report (1957-58), 1457
Fork, D C (Haxo, Dr F T , and) Photoreactive Pigments in Flagellates—Photosynthetically Active Accessory Pigments of Cryptomonads, 1051
Form of Soluble Derivatives Extraction of the Total Protein from Wheaten Flour in the (E E McDermott and Dr J Pace), 546
Form (Upper) Science by the (British Association for the Advancement of Science, Section X (Assembly of Corresponding Societies), Meeting on), 596
Form Reversal in Aphids Ants and (Dr Bruce Johnson), 740
Formalin Estimating Earthworm Populations by using (Dr F Raw), 1661
Formalization of Constructive Concepts, *review* by Dr Hao Wang, 1435
Formation of Allantoin and Allantoic Acid from Adenine in Leaves of *Acer saccharinum* L (Robert L Barnes), 1944
Formation of Different Cell–Virus Relationships in Tumour Cells induced by Polyoma (Dr Leo Sachs and Ernest Winocour), 1702
Formation of Enzyme-Substrate Complex Proof of the, by 'Crossing-Paper Electrophoresis' (Prof S Nakamura, K Takeo, I Sasaki and M Murata), 638
Formation of 3-Hydroxytetrahydrothiophene-1,1-dioxide *in vivo*, and Reactions with Thiols *in vitro* Metabolic and Chemical Studies of 'Myleran'— (Dr J J Roberts and Dr G P Warwick), 1288
Formation of Leucrose in Dextran-producing Cultures of *Streptococcus bovis* (R W Bailey and Prof E J Bourne), 904
Formation of Long Platelets from Pulmonary Megakaryocytes A Possible Explanation of the (Dr J George Sharnoff), B A 75
Formation of Noradrenaline from Adrenaline by Rat Liver Mitochondria (Dr Kunio Yagi and Dr Toshiharu Nagatsu), 1316
Formation of Polygalacturonase in Lucerne and Clover Effect of *Rhizobium* Polysaccharide on the (H Ljunggren and G Fahraeus), 1578
Formation of Polyols by the Lens of the Rat with 'Sugar' Cataract (Dr Ruth van Heyningen), 194
Formation of the Porphyrin Ring (Prof Jonathan B Wittenberg), 876
Formation of Stellar Associations from Galactic Gas (Prof Vladimir Vand), 441
Formation of Streptolysin S by Streptoccal Protoplasts (Dr Yoshiharu Maruyama, Sadako Sugai and Prof Fugio Egami), 832
Formation of the Toxoid of Histamine Sensitizing Factor in *Bordetella pertussis* (Prof Toshitaka Matsui and Yoshio Kuwajima), 199
Formation of the Virus of Foot-and-Mouth Disease Effect of Proflavine on the, and its Infective Ribonucleic Acid in Pig Kidney Tissue Culture Monolayers (Fr Brown and Doreen L Stewart), B A 74
Formation (Antheridium), in the Fern Species *Anemia phyllitides* Control of (Dr Ulrich Näf), 798
Formation (Antibody) Specific Inhibition of, during Immunological Paralysis and Unresponsiveness (Dr E Sercarz and Dr A H Coons) 1080
Formation (Cell-Wall), in Root Hairs (A B Wardrop), 996
Formation (Complex), of Chlorpromazine with Flavins (Dr Kunio Yagi, Takayuki Ozawa and Toshiharu Nagatsu), 982
Formation (Concept-), and Language Classification, (British Society for the Philosophy of Science Symposium on), 1193
Formation (Deoxyribonucleic), in Multiplying HeLa Cells (C L Smith, A A Newton and P Wildy), 107
Formation (Lesion), in Virus-infected Plant Tissues Biochemical Mechanism of (Dr F Solymosy, Dr G L Farkas and Dr Z Kiraly), 706
Formation (Phage) Induction of, in the Lysogenic *Escherichia coli K*-12 by Mitomycin C (Dr Nozomu Otsuji, Dr Mutsuo Sekiguchi, Dr Teiji Iijima and Dr Yasuyuki Takagi), 1079
Formation (Sclereid), in the Leaf of *Camellia japonica* Pattern and Control of (Donald E Foard), 1663
Formation (Skeletal), in the Chick Embryo Inhibition of, following Administration of Tetracycline (Gerrit Bevelander, Hiroshi Nakahara and Gloria K Rolle), 728
Formation (Spore), in *Bacillus licheniformis* Antibiotic Production as a Function of (Robert W Bernlohr and G D Novelli), 1256
Formation (Unexpected), of Volatile Compounds on Gas–Liquid Chromatography Columns (C Weurman and J Dhont), 1480
Formats (Printing Types and) Effects of, on the Comprehension of Scientific Journals (E C Poulton), 1824
Formic Acid (Anhydrous) Action of, on Peptides and Proteins (H Kienhuis, G Blasse and J Matze), 2015
Forms (Diverse Morphological), in *Convolvulus pluricaulis* Chois Intraspecific Polyploidy and Evolution of (Dr S L Tandon and C P Mzalik), 481
Forms (Spiral and other Growth), of Synthetic Diamonds—a Distinction between Natural and Synthetic Diamond (Prof S Tolansky and Dr I Sunagawa), 1526
Formulations (Soil Insecticide and Nematicide) Effect of Emulsifiers and Organic Diluents in (F T Phillips), 1512
Formyl Porphyrins Reaction of, with Acetone-Hydrochloric Acid (Dr P S Clezy), 1142
Forrest, J A (Conway, Dr Elsie, and) Effects of Substituted Phenoxy-Compounds and other Translocated Herbicides on the Rhizome of Bracken, 1416
Forssberg, A Biological Effects of Low Doses of Ionizing Radiations (Types of Immediate Response to Irradiation), 1112
Forster, Prof Th Transfer Mechanisms of Electronic Excitation (Spiers Memorial Lecture of the Faraday Society), 688
  Fast Chemical Reactions in Solution (Transfer of Electronic Excitation Energy between Molecules), 1454
Forsterite Measurement of Intergranular Diffusion in a Silicate System—Iron in (Prof John J Naughton and Yasuo Fujikawa), B A 54
Forsythe, George E , and Rosenbloom, Paul C Numerical Analysis and Partial Differential Equations, *review* by Prof T A A Broadbent, 576
Fortet, Robert, and others Some Aspects of Analysis and Probability, *review* by D G Kendall, 214
Fossil Calcareous Organisms Determination of the Temperatures of Ancient Seas by the Measurement of the Oxygen Isotopes Ratio in (Y A Birstein), 1025
Fossil Cephalopoda Conchiolin Remnants in Mother-of-Pearl from (Dr Ch Gregoire) 1157
Fossil Meteorite ? (A I Shulzhenko) 1026
Fossil Penguin (New), from Australia (G G Simpson), 1612
Fossil Pollen from Seymour Island, Antarctica (Lucy M Cranwell), 1782
Fossil Skull (A New), from Olduvai (Dr L S B Leakey), 491
Foster, Dr A B , and others Biological Origin and Configuration of 10-Hydroxy-Δ^2-decenoic Acid, 634
